Psychopharmacology Bulletin
National Institute of Mental Health
5600 Fishers Lane Rm. 10C-14
Rockville, MD 20857

The *Psychopharmacology Bulletin* is available on subscription from the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402. Subscription price $11.00 per year for the United States. All other countries add $2.75 for postage. Please make check or money order payable to the Superintendent of Documents. An annual subscription for four quarterly issues begins with the next issue following receipt of the order. Single copies and back issues may also be ordered from the Superintendent of Documents. The expiration date is printed on the top line of the address label. Change of address and complaints about non-receipt of issues should be sent to the Superintendent of Documents, and should include the old address, preferably a mailing label, as well as the new address.

Meeting Announcements

The **Society of Behavioral Medicine**, formerly located at 600 North Wolfe Street, Baltimore, Maryland, is pleased to announce that its national office has moved to Knoxville, Tennessee. The Society's new address is:

The Society of Behavioral Medicine
P.O. Box 8530, University Station
Knoxville, TN 37916
Phone No. 615 974-5164

In addition, the Society's Third Annual Meeting will be held in Chicago, Illinois on March 3-5, 1982 at the downtown Chicago Marriott. This year's meeting will include courses in the fundamentals of behavioral medicine, numerous workshops, practica, symposia, and short courses, and a debate on the "Dangers and Benefits of Exercise." There will also be an invited address by Chandra Patel, M.D., of London, England entitled "A New Dimension on Coronary Heart Disease Prevention."

Inquiries about the Society and the upcoming meeting should be directed to Judith C. Woodward, Administrative Director, at the above address.

* * * *

The **International Conference on Alcoholism** will hold its meeting on March 30-April 4, 1982, in Oxford, England. For information write to: Philip Goldring, Broadway Lodge, Oldmixon Road, Weston-super-Mare, BS24 9NN, Avon, England.

* * * *

The **American Psychological Association** meeting will be held August 23-27, 1982 in Washington, D.C. For information write to: Adelbert H. Jenkins, c/o Candy Won, American Psychological Association, 1200 17th Street, N.W., Washington, D.C. 20036.

* * * *

The **International Congress on Alcoholism and Drug Dependence** will meet on October 9-15, 1982, in Tangier, Morocco. For information write to: International Council on Alcohol and Addictions, P.O. Box 140, CH-1001 Lausanne, Switzerland.

* * * *

An **International Evoked Potentials Symposium** will be held on October 18-20, 1982, in Cleveland, Ohio. For information write to: International Symposium Office, Cleveland Clinic Educational Foundation, 9500 Euclid Avenue, Cleveland, OH 44106.

* * * *

An **International Conference for the Mental Health of the Elderly** will be held in Cairo, Egypt on November 22-25, 1982. Anyone interested in submitting an abstract should forward same to one of the following members of the Program Committee:

Dr. A. Ashour
Secretary General
P.O. Box 290
Heliopolis, Cairo,
Egypt

Dr. Gosta Bucht
Department of Medicine
S. 90185
Umea, Sweden

Dr. Sanford Finkel

Books Received

The following new books have recently been received by us for review:

- **GABA and Benzodiazepine Receptors**, Vol. 26 in the series **Advances in Biochemical Psychopharmacology**, edited by E. Costa, G. Di Chiara, and G.L. Gessa. Available from Raven Press, 1140 Avenue of the Americas, New York, NY 10016; Price: U.S. $36.00; 321 pp.

- **Anxiety: New Research and Changing Concepts**, edited by D.F. Klein and J.G. Rabkin. Available from Raven Press, 1140 Avenue of the Americas, New York, NY 10016; Price: U.S. $49.50; 453 pp.
- **Phenomenology and Treatment of Psychophysiological Disorders**, edited by W.E. Fann, I. Karacan, A. Pokorny, and R.L. Williams. Available from SP Medical & Scientific Books, 175-20 Wexford Terrace, Jamaica, NY 11432; Price: U.S. $35.00; 335 pp.
- **Treatment of Migraine: Pharmacological and Biofeedback Considerations**, edited by R.J. Mathew (Proceedings of the Symposium of the Texas Research Institute of Mental Sciences, Houston). Available from SP Medical & Scientific Books, 175-20 Wexford Terrace, Jamaica, NY 11432; Price: U.S. $25.00; 170 pp.

New Journal

Archives of Gerontology and Geriatrics is a new English-language journal published in editorial cooperation with the National Institute of Geriatrics (INRCA), Rome, Italy, and F. Verzar International Laboratory for Experimental Gerontology (VILEG), Ancona, Italy, and Debrecen, Hungary.

The principal aim of the journal is to facilitate the exchange of information between specialists in research in experimental, clinical, and social studies on aging.

Experimental papers dealing with the basic mechanisms of aging at molecular, cellular, tissue, or organ levels will be published. Clinical papers will be accepted if they provide sufficiently new information and are of fundamental importance for the knowledge of human aging. Papers dealing with anti-aging pharmacological presentations in humans are welcome, as are papers on the social aspects of geriatrics. Review papers of interdisciplinary character are especially welcome.

Brief outlines should be sent to the Executive Editor for preliminary consultation:

Dr. Imre Zs-Nagy
Scientific Coordinator of VILEG
University Medical School, VILEG
Hungarian Section
H-4012 Debrecen/Hungary

Book Review

Biochemistry and Pharmacology of Ethanol (Vols. 1 and 2), edited by E. Majchrowicz and E.P. Noble, represent an extensive and scholarly compilation of subjects of interest to researchers and clinicians working in areas related to alcoholism and alcohol abuse. The aim of the editors was to provide in-depth, detailed reviews of the physiological, biochemical, and behavioral effects of alcohol and, in general, this aim has been met. The first volume is devoted mainly to discussion of ethanol metabolism, and to the effects of ethanol on metabolic pathways in peripheral organs and in brain. Detailed attention is given to descriptions of basic research on kinetic mechanisms of alcohol and acetaldehyde metabolism, and more clinically oriented accounts of the interference of ethanol with organ function are also included. In addition, several contributions deal with the often misunderstood or neglected interactions of ethanol with nutritional factors.

The second volume is more concerned with the biochemical, and particularly neurochemical, effects of ethanol. Many of the chapters discuss the possible contribution of ethanol to the important phenomena of intoxication, tolerance, and biochemical and hormonal effects of physical dependence. This volume also contains chapters on ethanol's interactions with other drugs, and discussions of currently popular areas of research, such as the fetal alcohol syndrome, as well as some more neglected but perhaps equally important aspects of alcohol exposure, such as effects on sleep. Within the second volume, several chapters are particularly well prepared. The chapter "Alterations in Neurotransmitter Function After Acute and Chronic Treatment with Ethanol" is a good example. By analysis of the methodology used in various published reports, the authors greatly clarified an area of research generally plagued with contradictory results. The above-mentioned chapter, "Fetal Alcohol Syndrome: Clinical Pharmacology", is another example of an excellent summary of an important subject area.

Although some unevenness is evident in the quality of the various contributions, in general, they are concise, informative, and substantial in their review of past and current work within each subject area. One especially useful feature for the casual reader, or one who is specifically interested in particular aspects of ethanol biochemistry or pharmacology, is the presence of summaries following each chapter. Because these volumes cover research which is relevant to so many important aspects of alcohol abuse, one wishes that attention could have been given to the psychosocial aspects of alcoholism. Perhaps this topic will be the subject of a later volume.

However, with respect to the biochemistry and pharmacology of ethanol, these two volumes will provide an excellent reference source for readers, both now and in the future.

The books may be ordered directly from the publisher, Plenum Press, 223 Spring Street, New York, NY 10013. Price: U.S.$47.50 (Vol. 1) and U.S.$42.50 (Vol. 2); 704 pp. (Vol. 1) and 574 pp. (Vol. 2).

Brief Report

Tardive Dyskinesia: Inter- and Intra-Rating Scale Comparisons

Mary Ann Richardson, M.A.,[1] and Thomas J. Craig, M.D., M.P.H.[2]

Tardive dyskinesia is an iatrogenic movement disorder that affects large numbers of psychiatric patients and as such has become a major public health concern. A multiplicity of assessment methods have been used to both define the prevalence of this disorder and determine the effectiveness of treatment modalities—the most common of these being rating scales (Gardos, Cole, & LaBrie, 1977). Several scales are currently in use which follow two main formats—multi-item scales and scales composed of several global ratings. The Simpson Tardive Dyskinesia Rating Scale (TDRS) and the Simpson Abbreviated Dyskinesia Scale (ADS) (Simpson, Lee, Zoubak, & Gardos, 1979) are examples of the multi-item approach. These scales list and define specific movements to be rated and provide scaling criteria. The Abnormal Involuntary Movement Scale (AIMS) (Guy, 1976) illustrates the combined global rating scale format and lists body areas to be rated and examples of the types of movements to be included within a body area. The lack of uniformity in these and other rating instruments demands that inter- and intrascale data be available to the research community to make possible meaningful comparisons of study results. Unfortunately, little work has been done in this area. Chien, Jung, Ross-Townsend, and Sterns (1977), studying a small group of outpatients, performed interscale correlations on five assessment methods—direct counting, the Gerlach scale, the Crane scale, a portion of the Simpson TDRS scale, and the AIMS scale. The TDRS and the AIMS showed average correlation coefficients to the other four scales of .74 and .73, respectively. The scores of two raters, a medical student and a psychiatrist, were averaged for these analyses. Smith, Kucharski, Oswald, and Waterman (1979) reported that intrascale correlations on the AIMS computed on mean patient scores ranged from .23 to .88. The present study offered the opportunity to perform both inter- and intrascale comparisons of the ADS and the AIMS using ratings collected on a large population of psychiatric inpatients by a single rater

Method

One hundred and thirty-two inpatients were evaluated for abnormal movements using the ADS and the AIMS at one rating session per patient by a single rater. Of this group, 40 were females (30.3%) and 92 were males (69.7%). Ages ranged from 19-82 with a mean age of 40 and a median age of 34.5. The Simpson scale was modified by removing tongue tremor, eyelid tremor, the four "other" categories, and by changing the scaling to conform to the five-point scale of the AIMS. The AIMS was modified by removing the "one less" rule for activated movements. Inter- and intrascale correlations were performed using the Pearson product-moment correlation coefficient. For the ADS, intrascale correlations were obtained for the total scale (Items 1-6, 8-10, 12-14) total facial/oral (Items 1-6), total trunk (Items 8-10), and total extremities (Items 12-14). For the AIMS, intrascale correlations were obtained for the total scale (Items 1-7), global severity (Item 8), total facial/oral (Items 1-4), trunk (Item 7), and total extremities (Items 5 and 6).

Results

Table 1 lists the interscale comparisons. These data demonstrate highly significant correlations between the two scales on total scores, and the total facial/oral and total extremities subscales of .95769, .98096, and .87294, respectively. The total trunk on the ADS and the trunk item on the AIMS show much lower correlations with all other scores.

Table 1

Interscale Correlations*
of the ADS and AIMS

	AIMS			
ADS	Total Scale (1-7)	Total Facial/Oral (1-4)	Trunk (7)	Total Extremities (5-6)
Total Scale (1-16)	.95769 $p < .0001$	.84862 $p < .0001$	.43272 $p < .0001$	.61630 $p < .0001$
Total Facial/Oral (1-6)	.84983 $p < .0001$	.98096 $p < .0001$	.19014 $p < .029$	.27279 $p < .0016$
Total Trunk (8-10)	.37841 $p < .0001$	.29113 $p < .0007$	.56167 $p < .0001$	.10438 NS
Total Extremities (12-14)	.67399 $p < .001$	.34387 $p < .0001$	.31225 $p < .0003$	.87294 $p < .0001$

* Pearson "r"

The intrascale correlations are listed in Table 2. The ADS shows a strong correlation for the total scale with the total facial/oral (.86169) and a correlation of .68120 for the total scale with the total extremities. Again, the total trunk score correlates much less strongly with either the total scale, total facial/oral, or total extremities. The total extremities subscale, in addition, showed low correlation with the total facial/oral score.

The AIMS demonstrated a similar pattern with good correlations between the total score and the global severity and total facial/oral items (.85103 and .86971, respectively). In addition, global severity correlated with the total facial/oral score—.72006. The total extremities subscale, however, correlated at a lower level with the total score and global severity items, while the trunk item showed the lowest level of correlation with all other subscales. Despite these variations, all correlations except that between the ADS trunk and extremities subscales achieved statistical significance.

Discussion

This study demonstrates that the ADS and the AIMS correlate well and seem equally efficient in the rating of tardive dyskinesia, despite real differences in format and content. The facial/oral subscales correlate particularly well both in intra- and interscale comparisons. These subscales are perhaps better conceptualized and may possess greater validity for this disorder in this population than the trunk and extremity subscales.

There is a possibility that because these ratings were collected by a single rater at a single session, the reported correlations are somewhat inflated by a carryover effect. On the other hand, interscale correlations performed by multiple raters could be deflated by differences between raters. The lower correlations reported for the trunk and extremity subscales, however, seem to speak against a substantial carryover effect for these data.

In summary, a multi-item rating scale and a scale combining global ratings show strong correlations. The selection of which scale to use will most likely be dictated by the research design. The multi-item scale would be preferable, for example, if the demonstration of differential treatment effects on specific tardive dyskinesia movements is needed; the global approach may be more efficient, for instance, for a large-scale prevalence study where a yes/no designation is all that is required.

The findings also suggest the need for more research into the reason for the relatively low correlations found for trunk and extremity ratings. For example, are these separate manifestations

Table 2

Intrascale Correlations* for ADS and AIMS

AIMS

ADS	Total	Global Severity	Total Facial/Oral	Trunk	Total Extremities	AIMS
		.85103 $p < .0001$	.86972 $p < .0001$	.46549 $p < .0001$	.65983 $p < .0001$	Total Scale
			.72006 $p < .0001$	.34745 $p < .0001$	.63516 $p < .0001$	Global Severity

with little physiologic relation to the facial/oral signs representing different patterns of vulnerability (e.g., demographic or clinical) or different underlying mechanisms, or are they merely more difficult to rate? If the former is so, should separate scales be developed rather than lumping all three body areas together into a total score which may obscure significant differences? If the latter, there may need to be a sharpening of diagnostic criteria for these areas.

Acknowledgment: The authors wish to thank Joseph A. Wanderling for programming and statistical assistance, and Frances Simpson for manuscript preparation.

Annual NCDEU Meeting (1981)—Abridged Proceedings

The annual meeting of the New Clinical Drug Evaluation Unit (NCDEU) of the Pharmacologic and Somatic Treatments Research Branch (PST), National Institute of Mental Health, took place on May 26-28, 1981 in Key Biscayne, Florida.

These annual meetings are open meetings sponsored by the PST which focus primarily on recent research findings in psychopharmacology. Updates or reviews of significant issues in this field are also presented.

As in previous years, we are again publishing summaries of the papers presented. We are now listing the titles and authors of all the papers in a panel or plenary session to provide the reader with a better understanding of the content and scope of these sessions. However, in some cases, not all of the papers of a session are included because they were not received before going to press.

Neurotransmitter Precursors for the Treatment of Depression

Alan J. Gelenberg, M.D.,[1] Candace J. Gibson, Ph.D.,[2] and Joanne D. Wojcik, R.N., M.S.[3]

The two most widely held biochemical models of depression—the catecholamine (CA) and indoleamine (IA) hypotheses—explain depression as a result of deficient transmission of the CA norepinephrine (NE) or the IA serotonin (5-hydroxytryptamine, 5-HT). Until recently, all drugs used to treat depression appeared to enhance neurotransmission in one or both of these systems, which was used to explain their antidepressant actions. In fact, it was this action of these drugs that gave rise to the models themselves. Another way to increase brain levels of NE and 5-HT, and potentially to increase presynaptic activity, would be the systemic administration of the precursors of the neurotransmitters, an approach something like organic gardening in the brain. For this purpose, the 5-HT precursors tryptophan and 5-hydroxytryptophan (5-HTP), and the NE precursors tyrosine and dihydroxyphenylalanine (DOPA), have been administered to depressed patients. This paper will review some of the theoretical background and clinical experience with these substances, present a view of their current status, and hazard a few predictions regarding the course of future research in this field.

Monoamine Hypotheses of Affective Disorders

Antidepressant Drugs

The CA and IA hypotheses of affective disorders, largely derived from the pharmacology of drugs that produce or reverse depression in humans and animals, suggest that central monoamine (MA) deficits—particularly of NE or 5-HT—may lead to depression (Maas, 1975; Schildkraut, 1965; Schildkraut & Kety, 1967). Both monoamine oxidase (MAO)-inhibitors and tricyclic antidepressants appear to potentiate the effective level of MAs at the synapse: MAO inhibitors inhibit MA degradation, increasing levels in brain; tricyclics inhibit brain MA uptake mechanisms, prolonging the action of MA at the synaptic receptor. Among the currently available tricyclic antidepressants, the secondary amine compounds (i.e., desipramine, nortriptyline, and protriptyline) are more potent inhibitors of NE-uptake in vitro and in vivo than the tertiary amines (amitriptyline, imipramine, and doxepin), which more selectively block 5-HT-reuptake (Bopp & Biel, 1974). However, all three tertiary amine tricyclics are metabolized in vivo to active secondary amines. Thus, administration of either a tertiary or a secondary amine tricyclic results in a blockade of NE reuptake. A novel approach to the treatment of depression, which is consistent with the CA hypothesis, has been the administration of a **β-adrenergic stimulating drug, salbutamol** (Lecrubier, Puech, Frances, et al., 1981).

Recently, questions have been raised about the role of uptake inhibition in the mechanism of tricyclic antidepressant action. For example, inhibition of reuptake occurs almost immediately, yet reversal of depressive symptoms typically requires several weeks of drug treatment. Despite these questions, the focus of attention remains on MA neurotransmission. Recent data suggest that following several weeks of tricyclic administration, changes may occur in the sensitivity of pre-and postsynaptic MA receptors (Maas, 1979; Sulser, Vetulani, & Mobley, 1978). Thus, via a receptor-mediated feedback mechanism, the neuronal firing rate may be altered and/or postsynaptic receptor sensitivity to the MA "message" may be readjusted. Although the advent of some newer classes of antidepressants has even thrown into question the primacy of NE and 5-HT in the genesis of depression and the action of antidepressant compounds (Gelenberg, 1980), the CA and IA theories still have considerable heuristic value and clinical relevance.

Postmortem Studies: Biochemical findings in depressed patients have provided some support of the MA theories. Postmortem findings in the brains of depressed patients who committed suicide have suggested central deficits in 5-HT. Decreased concentrations of 5-HT and its major metabolite, 5-hydroxyindole acetic acid (5-HIAA), have been found in the brainstem—particularly in the raphe nuclei, which contains cell bodies of 5-HT neurons (Birkmayer & Riederer, 1975; Lloyd, Farley, & Deck, 1974). No deficits in NE or dopamine (DA) have been found (Bourne, Bunney, Colburn, et al., 1968). A recent study, which examined brains from endogenously depressed patients who died of cardiac failure or pneumonia, reported no significant NE deficits but did find extensive decreases in levels of the major NE metabolite, 3-methoxy-4-hydroxyphenylglycol (MHPG), in 6 of 14 areas examined (Riederer, Birkmayer, Seeman, & Wuketich, 1980). This suggests that although NE levels are normal, brain NE turnover may be decreased in some depressed patients.

Cerebrospinal Fluid (CSF): Biochemically, depression may represent a heterogenous disorder, with subgroups of patients who have decreased NE function and normal 5-HT, others with decreased 5-HT and normal NE, and still others with normal values for both systems (Garver & Davis, 1979; Maas, 1975). Furthermore, this heterogeneity in biochemical measurements may underlie a possible heterogeneity in treatment response. For example, Maas has suggested that patients with NE deficits are more responsive to NE-augmenting therapies (e.g., desipramine or amphetamine), while those with 5-HT deficits will respond preferentially to 5-HT-augmenting treatment (e.g., amitriptyline, tryptophan, or 5-HTP) (Maas, 1975). Not all studies, however, support this dual-amine concept or differential drug responsiveness among patients (Ridges, Bishop, & Goldberg, 1980).

Studies of CSF MAs and metabolites have not been conclusive in confirming an MA theory of affective disorders (van Praag, 1980a, 1980b). In general, CSF levels of NE and its major metabolite, MHPG, are elevated in manics when compared with depressed patients. Reported levels in depressed patients have been less consistent —sometimes lower (Gordon & Oliver, 1971), sometimes the same as those in neurological controls (Post, Lake, Jimerson, et al., 1978; Shopsin, Wilk, Gershon, et al., 1973). These discrepancies could be due to the putative biochemical heterogeneity of depressive disorders: Decreases in CSF NE levels in a subgroup of patients might be obscured when means among a diverse group are compared to controls. Also, many of these studies do not distinguish depressives with a history of mania (bipolars) from those with no previous episodes of mania (unipolars and first-episode depressives).

As with CSF MHPG, baseline levels of lumbar CSF 5-HIAA, the 5-HT metabolite, are decreased in some, but not all depressed patients (Åsberg, Thoren, & Traskman, 1976; Papeschi & McClure, 1971; van Praag, 1980). However, in assessing 5-HT turnover in brain, a complicating factor is that a substantial portion of 5-HIAA measured in lumbar samples is derived from the spinal cord and may not reflect brain 5-HT metabolism. It seems there is a gradient of CSF 5-HIAA concentration: Levels in ventricular fluid are four to five times higher than those in lumbar fluid. When brain ventricular CSF was sampled directly, concentrations of 5-HIAA were lower in patients with endogenous depression, compared to levels in other psychiatric patients and in a neurological control group (Bridges, Bartlett, & Sepping, 1976).

A dynamic measure of central 5-HT turnover can be obtained by administering probenecid, which blocks the transport of acidic metabolites out of CSF, so that their rate of accumulation can be used as an index of 5-HT turnover (Goodwin, Post, Dunner, & Gordon, 1973). Studies using the probenecid technique report that 5-HIAA accumulation was decreased in 40 to 50% of depressed patients (Goodwin et al., 1973; van Praag, 1980). Interestingly, this same subgroup of patients has been reported to improve during treatment with the 5-HT amino acid precursor, 5-HTP (van Praag, 1980) (more about this later).

Urinary Metabolites: Studying urine to figure out what is happening in the brain has been compared to analyzing the Potomac river in an attempt to determine what the President had for lunch. Nevertheless, urinary MA metabolites are more accessible than brain, CSF, or even blood. The most studied of the urinary MA metabolites in depression is the major NE metabolite MHPG. A majority of urinary MHPG is supposedly derived from central nervous system (CNS) NE metabolism, which suggests that MHPG levels should reflect central NE turnover (deMet & Halaris, 1969). However, this remains controversial: Estimates of central contributions of MHPG to the urine pool range from 20 to 70% (Blombery, Kopin, Gordon, et al., 1980; Maas, Hattox, & Greene, 1979).

Like CSF levels of NE and MHPG, urinary levels of MHPG are also elevated in the manic phase of bipolar illness, in contrast with the depressive phase (Jones, Maas, Dekirmenjian, & Fawcett, 1973; van Praag, 1980). In bipolar patients, changes in urinary MA metabolites appear to precede mood swings (Jones et al., 1973), and there is general agreement that depressed bipolars excrete less MHPG than healthy controls (Jones et al., 1973; Jones, Maas, Dekirmenjian, & Sanchez, 1975; Schildkraut, Orsulak, Schatzberg, et al., 1978a; Schildkraut, Orsulak, LaBrie, et al., 1978b). In unipolar depressives, however, equivocal results have been obtained. Some reports indicate lower excretion in unipolar endogenous depressives as compared with healthy controls or patients with characterological depressions (Schildkraut et al., 1978a; Schildkraut et al., 1978b), but others do not (Beckmann & Goodwin, 1980). Earlier reports on this question are hard to interpret because they failed to specify depressive subtypes—e.g., bipolar or unipolar, primary or secondary, endogenous or other.

For proper design and interpretation of studies, it must be noted that the normal range of daily urinary MHPG excretion is very wide—900 to 3,500 mg daily (Hollister, Davis, Overall, & Anderson, 1978). This may be influenced by diet (Muscettola, Wehr, & Goodwin, 1977), mental state and anxiety (Sweeney, Maas, & Heninger, 1978), physical activity (Ebert, Post, & Goodwin, 1972), and state of sympathetic nervous system activity (Cymerman & Francesconi, 1975; Hollister, Prusmack, Knopes, & Kanaske, 1980; Izzo, Horwitz, & Kaiser, 1979). Furthermore, the observed MHPG decreases in unipolar patients are small: The range of MHPG excretion in unipolar depressed patients is 800 to 3,020 μg daily (Hollister, Davis, & Berger, 1980). Therefore, unless conditions such as diet, activity, and stress are carefully controlled in both subjects and healthy controls, variations within the normal range may obscure differences.

Several groups of investigators have observed a correlation between pretreatment urinary MHPG excretion and drug response. Specifically, depressed patients who excrete the lowest amounts of urinary MHPG tend to show a better response to drugs which act primarily on NE systems, compared to depressed patients with high levels of urinary MHPG (Bechmann & Goodwin, 1975; Fawcett, Maas, & Dekirmenjian, 1972; Hollister et al., 1980). However, there is not universal agreement on this point (Ridges, Bishop, & Goldberg, 1980).

Urinary 5-HIAA is even more susceptible than MHPG to environmental, dietary, and peripheral variations, and is therefore not a reliable index of central nervous system function (Nomra, Colmenares, & Wurtman, 1977).

Precursors

Biochemical Background

In mammalian brain, the CAs, DA and NE, and the IA, 5-HT, are synthesized from their amino acid precursors, L-tyrosine and L-tryptophan, respectively (Wurtman, 1980). The initial and rate-limiting steps in their syntheses are the hydroxylation of the aromatic ring of tyrosine by tyrosine hydroxylase (Nagatsu, Levitt, & Udenfriend, 1964) to form DOPA and the hydroxylation of the indole core of tryptophan by tryptophan hydroxylase (Friedman, Kappelman, & Kaufman, 1972) to form 5-HTP. Both of these amino acid intermediates—DOPA and 5-HTP—are rapidly decarboxylated by the enzyme aromatic L-amino acid decarboxylase to form the amine neurotransmitters DA and 5-HT (Lovenberg, Weissbach, & Udenfriend, 1962). In neurons that contain the enzyme dopamine-β-hydroxylase, DA is converted to NE (Axelrod, 1972).

The enzyme tryptophan hydroxylase is not normally saturated with its amino acid substrate in vivo and, therefore, the rate of brain 5-HT synthesis can be influenced by changes in brain tryptophan concentration (Fernstrom & Wurtman, 1971). Brain tryptophan concentration, in turn, varies directly with its plasma concentration and indirectly with the sum of the plasma concentration of the other large neutral amino acids (LNAA)—leucine, isoleucine, valine, phenylalanine, tyrosine—which compete with it for uptake into the brain (Fernstrom & Wurtman, 1972). Thus, tryptophan administration, or the ingestion of a carbohydrate-containing meal (which elicits insulin secretion, thereby lowering the plasma level of competing LNAAs), results in increases in brain tryptophan and, hence, in brain 5-HT.

It also has been said that the blood concentration of non-albumin-bound tryptophan determines the rate of tryptophan uptake into brain, but this remains controversial (Young & Sourkes, 1977).

Just as tryptophan hydroxylase is not fully saturated in vivo, the same holds true for tyrosine hydroxylase. Only 75% of tyrosine hydroxylase is saturated, as estimated by Carlsson and Lindqvist (1978). This means that raising (e.g., by tyrosine injection or consumption of a protein-containing meal) or lowering (by injection of a competing LNAA) brain tyrosine concentrations in rats can cause parallel changes in CA synthesis, as measured by the rate at which brain DOPA accumulates after decarboxylase inhibition (Gibson & Wurtman, 1977; Wurtman, Larin, Mostafapour, & Fernstrom, 1974). However, increases in brain tyrosine levels lead to increased NE release, as measured by the accumulation of the NE metabolite 3-methoxy-4-hydroxyphenylglycol sulfate (MHPG-SO|) (after probenecid, which blocks its egress from rat brain, or in animals subjected to cold stress, which increases NE turnover in brain) (Gibson & Wurtman, 1978).

In the basal state, DA neurons may be less dependent on tyrosine levels than NE neurons. Thus, administration of tyrosine to animals receiving probenecid does not result in further increases in the major DA metabolite, homovanillic acid (HVA). However, when DA receptors are blocked by pretreatment with haloperidol, thereby accelerating the firing rates of DA neurons, tyrosine does significantly elevate striatal HVA (Scally, Ulus, & Wurtman, 1977). Similarly, lesions that deplete DA stores and increase firing and turnover in central DA neurons also appear to increase the effects of tyrosine administration.

The response to tyrosine in NE systems also is enhanced when neuronal firing and amine turnover are increased. In hypertensive rats, tyrosine administration results in decreased blood pressure and increased concentration of NE metabolites in the brainstem (Sved, Fernstrom, & Wurtman, 1979). Presumably, NE neurons in the brainstem of these animals are deficient to start, which results in hypertension. The exisiting NE neurons are firing rapidly in a vain attempt to lower the pathologically elevated blood pressure. In this situation, tyrosine can enhance NE release, leading to increased NE transmission in the brainstem and deceased peripheral sympathetic outflow, which serves to lower blood pressure.

Probably the ability of tyrosine to accelerate CA synthesis depends quantitatively on the firing frequency of CA-containing neurons. Therefore, it is possible that in disease states characterized by deficiencies in NE or DA, in which neurons may be firing more rapidly (in an attempt to compensate for the deficiencies), there could be greater sensitivity of CA neurons to tyrosine administration.

The intermediate metabolites DOPA and 5-HTP also have been administered experimentally to increase central CA and IA activity, respectively, since they readily traverse the blood-brain barrier. Normally, concentrations of DOPA and 5-HTP in the brain are undetectable (Carlsson & Lindqvist, 1978); as soon as they are formed, they are rapidly decarboxylated to the neurotransmitters DA and 5-HT, respectively.

Although it is a precursor of the CA's DA and NE, DOPA can be transported into IA, as well as CA neurons. In DA neurons, DOPA is decarboxylated to DA and acts to replace the endogenously occurring neurotransmitter. In 5-HT neurons it is decarboxylated to DA and can displace or release 5-HT from its normal sites (Ng, Chase, Colburn, & Kopin, 1970), thus acting as a false neurotransmitter and interfering with normal 5-HT function. Therefore, DOPA administration leads to increased brain DA but decreased 5-HT; NE remains relatively unaffected (Everett & Borcherding, 1970; Karobath, Diaz, & Huttunen, 1971).

Under normal conditions, then, tyrosine may be preferable for increasing NE synthesis, while DOPA appears more specific for increasing DA synthesis. Furthermore, tyrosine administration has fewer effects on the IA system; although both may decrease brain tryptophan uptake competitively (Rieder, 1980), DOPA can also displace 5-HT from its storage sites, further decreasing brain 5-HT (Karobath et al., 1971).

Just as DOPA enhances CA activity at the expense of IA activity, the IA precursor 5-HTP creates the opposite problem. The administration of 5-HTP effectively raises brain 5-HT, but displaces NE after decarboxylation in CA-containing neurons and lowers brain NE in experimental animals (Lichtensteiger, Mutzner, & Langemann, 1967).

Compared to the intermediate precursors DOPA and 5-HTP, tyrosine and tryptophan may be more specific in increasing their respective neurotransmitters, NE and 5-HT. Their conversion depends on uptake into neurons containing the specific enzymes tyrosine or tryptophan hydroxylase, which are highly localized to those cells containing NE and 5-HT, respectively (Friedman et al., 1972; Nagatsu et al., 1964). Although they can compete with one another for uptake into brain, this effect is less than that seen with L-DOPA or 5-HTP on an equimolar basis.

The possibility has been raised that some depressed patients may have a reduced ability to convert orally administered tryptophan to 5-HTP (van Praag, 1980). It is conceivable that in such individuals, administration of the precursor 5-HTP may be more advantageous than treatment with tryptophan. Similarly, one could speculate that if a similar situation exists regarding NE, some depressed patients might respond preferentially to DOPA.

Precursor Studies in the Treatment of Depression

Unlike the biogenic amines DA, NE, and 5-HT, their precursors—DOPA, tyrosine, 5-HTP, and tryptophan—easily cross the blood-brain barrier. Thus, the precursors can be administered systemically to increase their respective amines' rates of synthesis. L-DOPA raises brain DA level, as measured by increased CSF HVA (Bunney, Brodie, Murphy, & Goodwin, 1971). L-DOPA probably has little effect on NE level and may actually decrease brain 5-HT, as observed by decreases in CSF 5-HIAA (Goodwin et al., 1973; Bunney et al., 1971). Tryptophan and 5-HTP both raise brain 5-HT levels, producing increases in CSF 5-HIAA (Goodwin et al., 1973; van Praag, 1980). 5-HTP appears to compete with tyrosine's entry into brain, which probably lowers DA activity and has been observed to produce decreased CSF HVA levels (Meyer, Welch, Deshmukh, et al., 1977). Orally administered tyrosine raises plasma tyrosine in man and increases urinary excretion of NE and MHPG (Glaeser, Melamed, Growdon, & Wurtman, 1979).

CA precursors: DOPA—Several trials of DOPA (with and without peripheral decarboxylase inhibitors) for the treatment of endogenous depression have been conducted. Results have generally been poor (Bunney et al., 1971; Carroll, 1972; Dunner & Fieve, 1975; Goodwin et al., 1971; Klerman, Schildkraut, Hasenbush, et al., 1963; Mendels, Stinnett, Burns, & Frazer, 1975; Murphy et al., 1973, Persson & Wålinder, 1971; van Praag, 1977,1980), although DOPA may activate some patients with psychomotor retardation. Among patients with prior manic episodes, periods of hypomania have sometimes been induced (Bunney et al., 1971; Goodwin et al., 1971; Murphy et al., 1973), which were alleviated by decreasing or discontinuing DOPA. Additionally, psychotic features have often been aggravated by DOPA (Goodwin et al., 1971).

It is conceivable that the clinical effects of DOPA are due to increases in brain DA, rather than NE activity. In fact, urinary and CSF levels of the DA metabolite HVA increase linearly with the administered dose of DOPA, but urinary concentrations of the NE metabolite MHPG do not increase until doses of DOPA exceed 4 g (Bunney et al., 1971; Goodwin et al., 1971). Furthermore, as noted earlier, DOPA administration can decrease central 5-HT activity, which might make some patients more depressed. In fact, some parkinsonian patients who receive high doses of DOPA actually develop severe depression (Goodwin et al., 1971). Also, some of the unwanted effects associated with DOPA have been attributed to its competition with uptake and lowering of brain levels of tyrosine and tryptophan (Lichtensteiger et al., 1967). L-DOPA is also associated with many other unwanted and toxic effects such as nausea and vomiting, blood pressure changes, and cardiac rhythm disturbances (Langrall & Joseph, 1972).

CA precursors: Tyrosine—Few trials with tyrosine have been conducted, since it had been believed that the enzyme tyrosine hydroxylase was fully saturated in vivo, and hence that no increase in CA levels could be achieved by tyrosine administration. Indeed, no change in brain NE *levels* is seen in animals treated acutely with tyrosine; however, significant increases do occur in the *rate* of synthesis (Carlsson & Lindqvist, 1978; Gibson & Wurtman, 1977; Wurtman et al., 1974). In addition, re-evaluations of the amount of saturation of tyrosine hydroxylase have suggested that normally it is 75% saturated, so that there is some leeway for increasing synthesis. Moreover, when conditions of deficient CA neurotransmitters exist, the effect of exogenous tyrosine is even more pronounced. As discussed earlier, for instance, tyrosine injection increases the level of MHPG-SO_4 in the brainstem of spontaneously hypertensive rats and lowers blood pressure by a central mechanism (Sved et al., 1979). Therefore, tyrosine may be more specific than other means for increasing brain NE synthesis, particularly if there is a preexisting deficiency. This could make tyrosine particularly useful for treating human diseases characterized by such a deficiency.

One early report on the use of tyrosine in depression failed to find an effect, but there was no indication of the dose used or the length of treatment (Carroll, 1972). In 1980, we published the results of a single-case, placebo-controlled, double-blind crossover trial (Gelenberg, Wojcik, Growdon, et al., 1980). A 30-year-old woman with primary unipolar depression had to discontinue an antidepressant drug because of unwanted effects. As an alternative, she was treated with tyrosine, 100 mg/kg/day by mouth, in three divided doses. Her depression improved markedly after 2 weeks of tyrosine therapy, and within 1 week of placebo substitution her depressive symptoms began to return. The reinstitution of tyrosine therapy was followed by a marked improvement in depression. No adverse effects were noted. Plasma tyrosine levels drawn 2 hours after a dose were approximately double those measured during placebo ingestion. Soon after, Goldberg reported symptom improvement following nonblind administration of tyrosine to two patients who had previously responded to amphetamine (Goldberg, 1980). Perhaps in these patients tyrosine was specifically correcting an NE deficiency, since amphetamine responders have been found to have relatively low levels of urinary MHPG (Fawcett et al., 1972).

We now have data on an additional six patients who have entered an ongoing double-blind, placebo-controlled pilot study. Three patients were randomly assigned to placebo and three to oral tyrosine (100 mg/kg/d, in three divided doses), for a 4-week trial. During tyrosine treatment, the mean score on the Hamilton Depression Rating Scale (HAM-D) was reduced by 55%, from a initial mean of 21.7 to a final score of 9.7 (*see* Table). In the placebo group, only a small reduction occurred, from an initial mean score of 25.7 to a final mean of 21.3. The three tyrosine-treated patients showed impressive improvement on their HAM-D scores (Table), while two of the three placebo patients had to be withdrawn from the study: One patient deteriorated and became suicidal; the other asked to be removed from treatment because of lack of improvement.

Table

Hamilton Score Changes with Tyrosine and Placebo

			Hamilton Depression Rating Scale (HAM-D)	
Patient	**Age**	**Sex**	**Initial Score**	**Final Score***
Tyrosine (100 mg/kg)				
1 (KC)	36	M	22	19
2 (FB)	41	M	20	3
3 (JS)	56	F	23	7
Mean ± SE			21.7 ± 1.5	9.7 ± 8.3
Placebo				
4 (NM)	46	M	25	18
5 (JB)	45	M	30	21
6 (DG)	51	M	22	25
Mean ± SE			25.7 ± 4.0	21.3 ± 3.5

*Final score was determined 4 weeks after beginning of treatment, except for Patients #4 and #6, who were withdrawn from the study early and evaluated at the time of withdrawal, 15 days and 7 days, respectively.

Interestingly, there seems to be a correlation between the change in HAM-D score (pretreatment vs. posttreatment) and the change in fasting plasma tyrosine level (percent change from initial level) (*see* Figure), which is similar to what has been reported during tryptophan therapy (Chouinard, Young, Annable, & Sourkes, 1979).

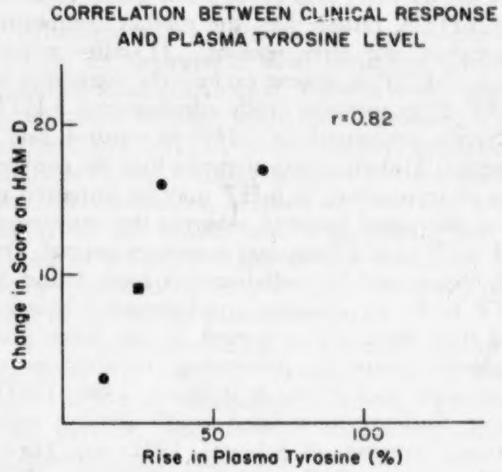

FIGURE. Correlation between clinical response and plasma tyrosine level.
● = patients receiving tyrosine
■ = patients receiving placebo

Change in score on the Hamilton Depression Rating Scale represents the initial value (Day 0) minus the final value (Day 28).

Rise in plasma tyrosine represents the percent increase in fasting plasma tyrosine level on Day 28 from the initial level on Day 0. Tyrosine was measure fluorometrically by the method of Waalkes and Undenfriend.

Other studies have suggested possible abnormalities of peripheral amino acid metabolism in depression. There are indications that peripheral tyrosine metabolism and uptake into brain may be altered in depressed patients. The normal 11 a.m. peak in blood tyrosine level is absent in the depressed phase (Benkert, Renz, Marano, & Matussek, 1971; Kishimoto & Hama, 1976), and there may be less transport of tyrosine into brain (Gaillard & Tissot, 1979). Even if these metabolic changes are not primary factors in the genesis of depression, decreases in plasma tyrosine could aggravate existing central compromises in NE function.

IA precursors: 5-HTP—The use of the intermediate precursor of 5-HT, 5-HTP, for the treatment of depressed patients was reviewed recently by van Praag (1980). His group chose to use 5-HTP, rather than the mother compound tryptophan, for three reasons: 1) unlike tryptophan, 5-HTP is almost exclusively converted to 5-HT; 2) in animals, orally administered 5-HTP is partly converted to 5-HT in central 5-HT neurons; 3) their group suggests that the conversion of tryptophan to 5-HT may be impaired in some depressed patients, whereas the conversion of 5-HTP to 5-HT appears to remain normal. Dr. van Praag and his collaborators have found 5-HTP to be an effective antidepressant acutely, and they have also reported it may have prophylactic value in preventing recurrences of depression (van Praag & deHaan, 1980; 1981). These findings have been confirmed by some (Angst, Woggon, & Schoepf, 1977; van Hiele, 1980), but not all (Brodie, Sack, & Siever, 1973; Takahashi, Takahashi, & Masamura, 1976) investigators.

Assuming the possibility that 5-HTP is an effective antidepressant, negative results may have reflected some or all of the following:

1) Study Design: Some studies used numbers of patients that were inadequate to establish significant differences from placebo. Moreover, in some, patients were treated for periods of time (1 to 2 weeks) that are too brief to test antidepressant effects.

2) Dosages: There is a probability that 5-HTP has a "therapeutic window" (van Praag, 1980). In some studies, dosages may have been inadequate; in others, excessive levels of 5-HTP could have resulted in decreases in DA and NE concentrations and activity, leading to countertherapeutic outcomes.

3) Selection of Patients: There is evidence that a subgroup of depressed patients might have a "serotonergic" depression and, in fact, patients who exhibit increased accumulation of 5-HIAA in CSF after probenecid administration have been reported to respond best to 5-HTP therapy (van Praag & deHaan, 1979). Also, there is preliminary evidence that 5-HTP may enhance the action of the serotonergic tricyclic antidepressant clomipramine and MAO inhibitor antidepressants (van Praag, 1980).

Dr. van Praag typically administers 5-HTP in combination with an agent such as carbidopa, which inhibits peripheral decarboxylase. This diminishes the conversion of 5-HTP to 5-HT outside of the brain, thereby a) increasing the amount of 5-HT that is centrally available, and b) decreasing unwanted effects. One of the most common and limiting of these unwanted effects has been gastrointestinal upset, attributed to direct effects of 5-HTP on stomach and intestinal walls. To circumvent this problem, Dr. van Praag uses an enteric-coated capsule.

IA precursors: Tryptophan—Tryptophan has undergone many trials as an antidepressant (Bunney et al., 1971; Carroll, 1972; Chouinard et al., 1979; Dunner & Fieve, 1975; Mendels et al., 1975; van Praag, 1977; van Praag, 1980), but unfortunately no consensus has emerged about its efficacy. In fact, a "weigh in" of positive vs negative data would likely be equal. Several excellent reviews over the past few years have evaluated the wide range of studies of tryptophan as an antidepressant (Cole, Hartmann, & Brigham, 1980; Cooper, 1979; Growdon, 1979; van Praag, 1980; Wirz-Justice, 1977).

As was the case with 5-HTP, we will make the assumption that tryptophan actually has some merit as an antidepressant and will attempt to explain the negative data. There is a heuristic advantage to this approach, as it can help in the design of future studies.

1) Inadequacy of study design—Similar to the case with 5-HTP, some studies with tryptophan have used inadequate patient samples for too brief periods of time.

2) Dosage—Evidence has emerged of a possible "therapeutic window" for tryptophan: in six separate studies in which tryptophan was found to be an effective antidepressant, the mean dose was 6 g/day; in seven other studies in which it was ineffective, the mean dose was 8.7 g/day (Young, Gibson, & Gauthier, in press). There is evidence that the therapeutic range may be different for bipolar compared to unipolar patients (Goldberg, 1980). There is also evidence that the co-administration of an inhibitor of tryptophan pyrrolase in

liver may shift the therapeutic window toward lower doses (Goldberg, 1980).

Possible explanations for the therapeutic window include: a) greater induction at higher tryptophan doses of the liver enzyme tryptophan pyrrolase, which catabolizes tryptophan; b) competition of tryptophan with tyrosine for uptake into brain, so that excessive doses would lower brain NE synthesis; c) increased formation at high doses of other active amines, such as tryptamine, which may adversely affect normal 5-HT function (Young et al., in press).

It is interesting that several more recent studies failed to find an antidepressant effect of tryptophan (Cooper & Datta, 1980; Wålinder, Carlsson, Persson, & Wallin, 1980). In each, the dosages were above the therapeutic window determined by Chouinard (1979).

3) Heterogeneity of patients—As noted above, there is evidence that bipolar and unipolar patients may respond differently to tryptophan. In addition, as was the case with 5-HTP, it is conceivable that only those patients whose depression is characterized by low 5-HT activity will respond selectively to tryptophan treatment.

Another source of interpatient variability concerns plasma levels of amino acids. Brain tryptophan concentrations is determined, in part, by the ratio of plasma tryptophan to the plasma concentrations of competing LNAA (see page 10). Consistent with this observation, Møller and colleagues have reported that patients with the lowest tryptophan/LNAA ratio achieved a remission frequency of 80% by Day 14 of tryptophan therapy, while patients at the higher end of the spectrum did not benefit from tryptophan more than from placebo (Møller, Kirk, & Honore, 1980). Therapeutic efficacy has also been related to increases in fasting plasma tryptophan during tryptophan treatment: the larger the increase, the greater the improvement in score on a standard depression rating scale (Chouinard et al., 1979).

4) Interaction with other antidepressants—Until more is known about the effects of administering tryptophan alone, it may be difficult to puzzle out the effectiveness of tryptophan as an adjunct to antidepressant drug therapy. For example, Wålinder and associates (1976) found that tryptophan hastened the onset of therapeutic action of clomipramine, a particularly potent inhibitor of 5-HT uptake (although one whose active metabolite also blocks NE uptake). By contrast, however, Wålinder and his colleagues were unable to find any advantage of combining tryptophan with zimelidine, an even more potent inhibitor of 5-HT uptake Wålinder, Carlsson, & Persson, 1981).

Conclusion

Although none of the amino acid precursors can do for depression what penicillin does for pneumococcal pneumonia, there is every reason to continue clinical trials with tyrosine, tryptophan, and 5-HTP. Unfortunately, the lack of pharmaceutical industry support to fund studies on these substances, coupled with the easy availability of the amino acid tryptophan, has resulted in widespread use of this substance and many publications but, at least until recently, little in the way of conclusive data.

Aside from attending to generally accepted methods of clinical research in depression—including adequate numbers, adequate trial periods, and careful distinction among phenomenologic subtypes—future studies on these substances would do well to incorporate important biochemical markers such as plasma amino acid levels, urine, and possibly CSF amine metabolites, careful control of diet, and attention to optimal levels of drug dosages.

It is possible that a subtype of depressed patient may respond to one or several of these precursors. Possibly, for some patients a combination of a 5-HT and an NE precursor may be optimal therapy. If so, it is conceivable that these agents, alone or in combination with antidepressant drugs, may enhance therapy for depression. In any case, studies designed to test out these hypotheses will clearly shed new light on the biochemistry and the pharmacotherapy of depression and of brain function in general.

Acknowledgment: The author would like to thank Mrs. Emily N. Prins for typing and proofing the manuscript.

Low-Dose Neuroleptics in Outpatient Schizophrenics

John M. Kane, M.D.,[2] Arthur Rifkin, M.D.,[3] Margaret Woerner, Ph.D.[2] and Gerard Reardon, M.A.[3]

Introduction

The value of maintenance neuroleptics in preventing psychotic relapse among schizophrenic outpatients has been well established. Increasing attention, however, must be given towards improving the benefit-to-risk ratio of long-term treatment. Side effects, particularly tardive dyskinesia, remain an important problem, and attempts to reduce toxicity by establishing minimum dosage requirements are necessary. No systematic dose response studies of maintenance medication is schizophrenic outpatients have been reported. In addition, there is a need for more information as to the impact of maintenance medication on patients' social and vocational adjustment and their interactions with significant others.

The present investigation was preceded by a pilot study (Kane, Rifkin, Quitkin, et al., 1979) in which the authors openly treated 57 stable or remitted patients meeting Research Diagnostic Criteria (RDC) for schizophrenia with dosages of fluphenazine decanoate (FD) ranging from 1.25 mg to 5.0 mg, administered intramuscularly (i.m.) every 2 weeks. Though relapse rates were higher than those expected with standard doses, the majority of patients were able to maintain good remission for 6 months. A subgroup of the patients who had completed 6 months of low-dose treatment were randomly assigned, double-blind, to continue on low-dose treatment or be switched to placebo. Seven of eight placebo-treated patients relapsed as compared to one of eight patients continuing on active medication ($p = .02$).

Method

This report presents preliminary results from an ongoing double-blind comparison of low dose (1.25-5.0 mg) and standard dose (12.5-50.0 mg/2 weeks) FD, conducted at three separate sites. Subjects are remitted or partially remitted RDC schizophrenics. Criteria for remission and relapse are defined in terms of Brief Psychiatric Rating Scale (BPRS) and Global Adjustment Scale (GAS) ratings. Relapsed patients are treated openly with standard doses of FD as needed (in addition to experimental medication). Following recovery from relapse, patients are continued in the study on experimental medication only. The length of the study is 1 year. Assessment measures included the BPRS every 4 weeks, the Clinical Global Improvement (CGI) every 2 weeks, and the GAS every 12 weeks. Extrapyramidal side effects and abnormal involuntary movements are assessed every 12 weeks utilizing the Simpson Angus Scale and the Simpson Dyskinesia Scale. The Premorbid Asocial Adjustment Scale is completed by the research assistant at baseline, and a modifed version of the Social Adjustment Scale is administered to the patient and a family member at baseline, Week 26, termination, and (in the case of the family assessment) at any point of relapse. The patient completes the Symptom Checklist-90 every 12 weeks. Laboratory measures include drug-free prolactin levels at baseline followed by a 2-hour prolactin response to an intramuscular injection of haloperidol. Subsequent prolactin and fluphenazine blood levels are obtained at eight additional time points during the year. The present report will not include any laboratory data.

To date, 126 patients have entered the study. Their mean age is 29 (*SD* 7.1). The mean age at first hospitalization is 23 (*SD* 5.2), and the average number of previous hospitalizations is 3.2 (*SD* 1.9). The mean number of weeks since hospital discharge is 64 (*SD* 78.5)

Results

Twenty-six of the 62 patients assigned to low-dose treatment have relapsed a total of 31 times (5 relapsed twice). Seven of these required rehospitalization. Among the 64 patients receiving

[3] Mount Sinai Medical Center, New York, NY 10029.

standard doses, three patients relapsed a total of four times, none requiring rehospitalization. Eighty percent of those patients relapsing on low dose did so within the first 6 months. The median length of time required to restabilize patients relapsing on low dose was 6 weeks; the mean was 11 weeks.

The results of a life-table analysis indicate that the cumulative proportion relapsing on low-dose treatment is 56%. For those patients receiving standard dose, the cumulative proportion relapsing is 7% ($p<.001$). Using the measure of relapse, the low-dose preparation is clearly not as effective as standard doses. However, there are other issues involved in assessing the risk benefit ratio. To date, four patients on standard dose and two patients on low dose have developed presumptive tardive dyskinesia. In a subgroup of 51 patients at Long Island Jewish-Hillside Hospital who completed at least 24 weeks in the study, an analysis of covariance involving the end-point Simpson Dyskinesia Scale scores revealed a significant advantage for low-dose treatment. Our preliminary analyses employing the Simpson Angus Scale for extrapyramidal side effects did not demonstrate a significant difference between the two treatment groups.

Given the relapse rates on low dose, it is important to determine the ultimate cumulative dose administered to these patients. If this proved to be equivalent to standard doses, the original goal would not be met. In a comparison of 9 low-dose patients who relapsed but completed the 1-year study with 20 patients on standard dose who completed 1 year without relapse, the low-dose patients received significantly less medication despite the relapses (16 cc's as compared to 27½ cc's in standard dose equivalents; $t = 2.39$, $p < .05$).

To assess social adjustment and family burden, interviews with the patient and separately with the family were conducted by a trained research assistant. The preliminary results from the social adjustment and family burden measures suggest that despite the increased risk of relapse, the low-dose patients are not significantly worse off than the standard dose patients and, in fact, may be doing significantly better in some areas.

Conclusion

It would appear that low-dose treatment is a viable strategy for a subgroup of remitted or partially remitted outpatient schizophrenics. Further analyses (including the laboratory data) will attempt to identify predictive factors which might help in selecting patients for whom this strategy is most likely to be effective. At present, we are left with a complex interaction of various factors which need to be taken into consideration in planning long-term treatment.

Early Intervention vs. Continuous Pharmacotherapy of Schizophrenia

William T. Carpenter, Jr., M.D.,[1] Joseph H. Stephens, M.D.,[1] Alix C. Rey, M.D.,[1] Thomas E. Hanlon, Ph.D.,[1] and Douglas W. Heinrichs, M.D.[1]

There is an increasing appreciation that long-term use of high-dose neuroleptics does not produce a generalized and continuous therapeutic effect in all schizophrenics. Neuroleptics may impair functioning in areas not affected by the illness *per se*. Also, tardive dyskinesia has become a compelling reason for avoiding indiscriminant use of neuroleptics.

The present study attempts to assess the relative merits and limitations of continuous maintenance pharmacotherapy when compared with the targeted use of neuroleptics in an early intervention strategy, followed by drug discontinuation when the patient is stabilized. The issue is not how no-drug use compares with drug use, but rather how the targeted and time-limited use of drugs compares with continuous use. The targeted alternative is, in fact, already utilized by some clinicians and viewed favorably from the perspective of long-term followup (Bleuler, 1978).

Conceptual Model for an Early Intervention Strategy

Schizophrenia is conceptualized as a relapsing illness, and the aim of an early pharmacologic intervention is to prevent, or minimize, impending psychotic episodes. Presumably, good candidates for this approach would be robust drug responders with prodromal signs of impending relapse over a sufficient time period to permit identification and intervention. Patients who maintain insight concerning their illnesses during early phases of relapse should be more likely to seek treatment and cooperate with intervention efforts. An ongoing therapeutic relationship is crucial for the tasks of discerning prodromal signs during previous episodes, educating family and patient as to their importance in the intervention strategy, and providing a personal availability at times of impending relapse.

Methods

Patients selected for this study had recently been discharged from hospital care with a diagnosis of schizophrenia. Since one aim of the study was to characterize both good and poor candidates for a targeted drug approach, the selection of patients attempted only to assure the diagnosis of schizophrenia and the probability that patients were suitable candidates for antipsychotic medication. Patients who passed screening and agreed to participate in the treatment program were followed through an initial 4- to 8-week stabilization period in which further baseline psychiatric history, family history, and prognostic data were collected. The patient then entered a 28-day off-drug phase (42 days if withdrawal from long acting depot medication) aimed at identifying covert dyskinesia and which provided baseline assessment of psychopathology, a basis for making a diagnosis using the Research Diagnostic Criteria (RDC) and psychophysiological, neuropsychological, and biochemical data. At the end of 28 days (or sooner, if psychiatric decompensation had already required pharmacologic intervention), patients began a 2-year course of treatment with either continuous or targeted antipsychotic drug use assigned on a random basis. Subsequent interventions (increase of medication in continuous drug patients and initiation of medication in targeted drug patients) were based on a clinical judgment that prodromal symptoms had appeared and that a relapse was imminent. Drug reduction in the continuous, or drug discontinuation in the targeted groups, followed either return to baseline or stabilization of the patient's condition. All patients remained in their treatment group regardless of factors such as decompensation and rehospitalizations. Since treatment failure patients retained their original group assignment, it was possible for a patient on targeted drug treatment to remain on medication during most of the 2-year treatment course. Key points of assessment were at baseline, surrounding each decompensation, and at 6, 12, 18, and 24 months following the beginning of the experimental treatment phase. A variety of assessment techniques aimed at deficit symptoms, quality of life, role performance, and symptom course were utilized. Evaluations were made by an independent assessor free of all responsibility for clinical care.

Results

Two issues will be examined with the preliminary data from a cohort of 57 patients: consequences of drug cessation in 55 patients, and consequences of treatment assignment in the 41 patients already completing 6 months. Two of the 57 patients are excluded from the drug cessation observation. One patient was not on drugs when admitted to our clinic and one patient agreed to discontinue drugs only if returned to medication 2 weeks later. Thirty-eight of 55 patients (69%) completed 28 days off drugs without decompensation. The remaining 17 patients showed signs of relapsing and return to drugs was initiated. Four of the 17 patients required hospitalization as a result of their decompensation while off drugs. One hospitalized patient was rediagnosed manic depressive and did not return to the clinic. For the other three patients, the average hospital stay was 23 days.

The course of decompensation was charted in the 16 cases available for followup. Factor I of the Brief Psychiatric Rating Scale (BPRS) and total BPRS scores indicated that 8 patients returned to baseline levels within 2 weeks, 12 within 8 weeks, and all 16 within 12 weeks.

During the pilot phase of this project, patients were randomized into one of the following groups: continuous drugs plus psychosocial treatment; continuous drugs without psychosocial treatment; and targeted drug with psychosocial treatment. Four patients refused their assignment to continuous drugs and were dropped from the study. Six-month followups are available on 41 patients thus far. Because there were no significant differences on primary outcome measures between the two continuous drug groups, they are combined in the Table. This Table reveals no differences between continuous and targeted drug use on several outcome measures in spite of the significantly lower exposure to drugs in the targeted group. Patients in the targeted group averaged 34% of time on drugs compared with 97% for the continuous group. Three of the 14 targeted drug patients were conspicuous failures (i.e., remained on moderate to high dose for the entire 6-month period). They were also poor outcome patients in spite of the continuous use of medication. The remaining 11 targeted drug patients averaged only 17% of time on drugs. Although the targeted group required more hospitalizations, the number is small and the difference was not statistically significant. The 14 patients in the targeted group were similar to the 27 patients on continuous drugs at 6-month followup (preliminary data at 12 months support this conclusion). Neither our clinicians' observations nor research data revealed evidence at 6-month followup that patients not receiving continuous antipsychotic drugs experienced more severe clinical or social consequences.

Conclusion

It is hoped that a 2-year treatment and observation period in a large number of cases will produce further data relevant to feasibility, prediction of response, and the impact of long-term medication on deficit symptomatology and interpersonal functioning. Present pilot data support the feasibility of the targeted drug treatment of schizophrenia and encourage an optimistic view of the potential applicability of targeted drug intervention in a sizable portion of schizophrenic patients.

Table

Outcome Variables at 6 Months in Two Drug Treatment Conditions

	Targeted Drug ($N = 14$)	Continuous Drug ($N = 27$)	P-values*
Strauss-Carpenter Outcome Score	21.5	22.9	N.S.
Global Assessment Score	52.0	54.8	N.S.
BPRS Total Score	1.93	1.75	N.S.
Number of Hospitalizations	4	2	N.S.
Days in Hospital	35	32	N.S.
Numbers of Weeks on Drugs	8.8	25.2	<.001
Total Drug Dose per Patient in CPZ Equivalents over 6 Months	28,095	69,210	<.001

* P-values based on non-paired t-tests.

Scores above are means except for number of hospitalizations.

Routine Use of Psychotropic Plasma Levels in Medically Ill Psychiatric Patients

Richard Dorsey, M.D.,[1] and Ann Bahrani, M.D.[1]

This preliminary report covers experience gained in the routine use of psychotropic plasma level measures in medically ill psychiatric patients during calendar year 1980. All patients were hospitalized and treated on a private basis by a team com-

---

[1] Epp Memorial Hospital, Cincinnati, OH 45243.

prised of psychiatrists and internists. The program was conducted in an open medical setting, with major emphasis on psychopharmacology.

Our group had primary or sole responsibility for providing psychiatric services at three hospitals during the year reported. Our total admissions were 1,023, with principal psychiatric diagnoses being effective psychoses, schizophrenic disdisorders, drug/alcohol dependence, and organic brain syndrome. Patients aged 65 and over comprised about 20% of admissions and accounted for about 40% of hospital days. Ninety-five percent of geriatric patients had one or more significant medical diagnoses (e.g., arteriosclerotic heart disease, diabetes mellitus, malnutrition). Approximately 70% of nongeriatric patients had one or more significant medical diagnosis (e.g., gastrointestinal/hepatic disorders, diabetes, or arteriosclerotic heart disease).

Method

Plasma Level Measures

All specimens from our two Cincinnati hospitals were sent to National Psychopharmacology Laboratories in Knoxville, Tennessee, with our system providing 36-hour turn-around time. Our third hospital, in Columbus, Ohio, used a local reference laboratory affiliated with Ohio State University and provided 24-hour turn-around time.

Our primary Cincinnati hospital service had 619 admissions, of which 15% were geriatrics; 1215 assays were done, for an average of 1.96 assays per patient admission. Our smaller Cincinnati hospital service accounted for 162 admissions, with 65% geriatrics; assays there were 511, or 5.16 per admission. Our Columbus service, which opened in October, accounted for 242 admissions (October to December) with geriatrics comprising less than 5%. Total assays were 246, or 1.01 per patient.

Therapeutic ranges were those reported by the National Psychopharmacology Laboratory (see Table) based on published literature. Limitations of underlying evidence for some drugs were acknowledged, and ranges were regarded as useful for clinical guidance rather than as a definitive basis for dosage determination.

Table 1

Plasma and Whole Blood Assays of Psychoactive Drugs

Tricyclic Antidepressants	Therapeutic Plasma Range ng/ml	Sensitivity of the Method* ng/ml	Fee
Amitriptyline (Elavil) + Nortriptyline	125-250	5	$30
Clomipramine (Anafranil)	70-200	5	$30
Desmethylclomipramine	150-300	5	$30
Desipramine (Norpramin, Pertofrane)	40-150	5	$30
Doxepin (Sinequan) + Desmethyldoxepin	75-200	5	$30
Imipramine (Tofranil) + Desipramine (Norpramin, Petrofrane)	150-300	5	$30
Nortriptyline (Aventyl, Pamelor)	50-150	5	$30
Protriptyline (Vivactil)	50-150	5	$30

A minimum of 2 ml of plasma is required per assay for tricyclic antidepressants.

National Psychopharmacology Laboratory automatically assays the secondary amines for the tertiary tricyclics at no added cost, since interpretation without the secondary amines is not possible.

*Reporting low plasma levels is essential in distinguishing between the rapid metabolism and/or elimination versus noncompliance.

Benzodiazepines	Therapeutic Plasma Range ng/ml	Sensitivity of the Method ng/ml	Fee
Chlordiazepoxide (Librium)	400-1000	20	$22.50
Clorazepate (Tranxene) as Desmethyldiazepam	200-500	20	$22.50
Diazepam (Valium) and	200-400	10	$22.50
Desmethyldiazepam	200-500	20	—
Flurazepam (Dalmane)	70-120	—	—
Lorazepam (Ativan)	Bio-availability data only	10	$22.50
Oxazepam (Serax)	200-500	20	$22.50
Prazepam (Verstran) as Desmethyldiazepam	200-500	20	$22.50

Urinary MHPG	MHPG Normal Controls		
3-methoxy-4-hydroxy phenethyleneglycol (24-hour urinary collection)	Males $N = 27$ 1690μg/24 hr ± 526 *(SD)*	Females $N = 28$ 1337μg/24 hr ± 310 *(SD)*	$45

Where the therapeutic response ranges are not given, they will be furnished in our reports.

Antipsychotics	Therapeutic Plasma Range ng/ml	Sensitivity of the Method ng/ml	Fee
*Acetophenazine (Tindal)	Bio-availability data only	0.5	$30
Butaperazine (Repoise)	100-200	2	$30
Chlorpromazine (Thorazine)	50-500	5	$30
Chlorprothixene (Taractan)	Bio-availability data only	5	$30
*Fluphenazine (Prolixin)	0.2-4	0.2	$30
*Haloperidol (Haldol)	3-15	1.0	$30
Loxapine (Loxitane)	Bio-availability data only	5	$30
Mesoridazine (Serentil)	150-1000	5	$30
*Perphenazine (Trilafon)	1-6	0.2	$30
*Piperacetazine (Quide)	Bio-availability data only	0.5	$30
Thioridazine (Mellaril)	250-1250	5	$30
*Thiothixene (Navane)	0.4-4	0.2	$30
*Trifluoperazine (Stelazine)	>4	0.2	$30

*A minimum of 5 ml of plasma is required for these antipsychotic drugs. Given sensitivities based on 5 ml of plasma.

Lithium	
Plasma Lithium	$7
RBC and Plasma Lithium and calculated RBC/Plasma Ratio	$15

Other
Whole blood or RBC levels are assayed for the same price.

Drug levels were usually measured for psychotropic medications that patients had reportedly been taking just prior to admission. Levels for medications given in hospital were measured at about Days 5-7, and about every 5-7 days thereafter.

Clinical Utility

Our strategy for the use of psychotropic plasma levels in patient management was developed on the basis of clinical impression, without detailed data analysis. Most of our time was devoted to the patient care and administrative demands associated with establishing and running these services.

Patients found to have low psychotropic drug levels on admission were considered likely to be underdosed and/or noncompliant. Generally, the pre-admission drug was continued at a higher dose as initial treatment.

For those whose pre-admission medication produced a plasma level within the therapeutic range, we inferred that the patient was probably receiving the wrong drug. Accordingly, a different drug or class was used for initial treatment in the hospital.

High admission plasma levels suggested toxicity and/or the wrong drug (with the possible exception of a few "therapeutic window" drugs). Management in these cases consisted of initial benzodiazepine washout, followed by clinical reassessment.

After initiation of drug therapy in the hospital, plasma level guidance to dosing was used in the following way. Low plasma levels associated with poor therapeutic response justified increasing dosage on the basis of prospective benefit with minimal additional risk. Both factors were important considerations in the medically ill patient population with which we dealt.

Patients showing satisfactory therapeutic response were continued on the same medication even if the plasma levels were low, and were considered ready for discharge. Intolerance of side effects associated with low plasma level generally led us to discontinue medication.

Nongeriatric patients whose drug levels were within the appropriate range and who showed a satisfactory response were generally discharged. Geriatric patients generally were kept somewhat longer and rechecked for possible drug accumulation before being released.

A correct plasma level associated with poor therapeutic response led us to change drugs. Faced with a therapeutic level and poor side-effect tolerance, we generally tried lowering the dose, and/or blocking the most troublesome side effects. In some cases, a change of medication proved necessary.

High plasma levels associated with good therapeutic response led us to reduce the dose but continue the same medication. Generally, fewer side effects resulted, with no loss of therapeutic benefit.

High plasma level with poor therapeutic response also led us to reduce dosage. In some cases, the decrease in side effects when dosage was reduced gave us an opportunity to observe the beneficial effects of the drugs which had been masked by the side effects. In others, reduced dosage led to lowered plasma levels which had been above the therapeutic window but now fell in this range and may have contributed to a better response. Similarly, multiple side effects associated with high plasma levels were dealt with initially by reduction of dose of the same medication.

Conclusions

We found a high correlation between published therapeutic ranges and our clinical experience with patient response. Our focus was on plasma level categories of "too high," "about right," or "too low." The best correlation between plasma level and therapeutic response occurred in the sickest patients, where laboratory guidance to supplement clinical decision-making was especially desired.

In addition, we found enhanced patient satisfaction through use of laboratory testing to help establish proper treatment (an approach consistent with patient expectations from treatment in other areas of medicine). Other physicians were much more inclined to accept recommendations for high-dose psychotropic medications in medically ill patients if plasma level measurements offered reassurance concerning potential toxicity. Similarly, family physicians or outpatient psychiatrists, to whom many of our patients were referred for followup treatment, were more likely to continue therapeutic regimens with unusually high or low doses of medication when supporting plasma level data were provided. Finally, utilization review staff were impressed with the systematic approach to trying psychotropic drugs in sequence guided by plasma level measures, and would accept longer hospitalizations than otherwise would have been the case.

Overall, we believe psychotropic plasma levels constitute an extremely valuable guide to the clinician caring for the kind of patient population described. We acknowledge limitations in scientific data about the exact therapeutic range for each drug, but believe that even crude laboratory guidance is far superior to none at all. Based on our experience to date, we believe routine use of psychotropic plasma levels helps to maximize therapeutic benefit while minimizing risk and side effects for the medically ill psychiatric patient.

Assessing the Effects of Electroconvulsive Therapy (ECT)

Critical Research Issues

Jack D. Blaine, M.D.[1]

The inclusion of a session on ECT in the New Clinical Drug Evaluation Unit (NCDEU) meeting program reflects the new responsibility for research on somatic treatments, including ECT, given the Pharmacologic and Somatic Treatments Research Branch as a result of the Fall 1980 reorganization of the Division of Extramural Research Programs of the National Institute of Mental Health. Therefore, the Branch intends to develop a program of research support of ECT projects assessing the effects and role of ECT in the treatment of the mentally ill. In this session, the panel will discuss some of the critical research issues in the ECT field and report data from several of the ongoing clinical ECT research studies.

ECT was first introduced into clinical psychiatry over 45 years ago. Seizures modified by anesthesia and muscle paralysis have been commonly used for over 30 years. Despite this extensive clinical experience, ECT remains a controversial treatment among both mental health professionals and the general public. Much of this controversy arises from emotionally laden concerns including those about irreparable brain damage and abuses of patients' rights. These fears and concerns are elicited by the images of ECT treatment itself in contrast to more graphically benign psychotherapy or pharmacotherapy.

---

[1] National Institute of Mental Health, Rockville, MD 20857.

The controversy also exists in part because of a paucity of studies meeting contemporary scientific standards. ECT was developed and accepted as an effective treatment prior to the psychopharmacologic agents, and prior to the advent of the controlled clinical trial methodologies devised to assess the safety and efficacy of drugs. In addition, the complexity of the ECT treatment procedures and processes, in contrast to swallowing a pill, complicates the feasibility of carrying out well-controlled clinical ECT trials. For example, the inclusion of a "placebo" or simulated sham ECT control group raises ethical concerns. This design exposes severely ill patients to the potential risks of general anesthesia and muscle paralysis without probable therapeutic benefits. Because most patients referred for ECT are severely ill and often are not responsive to ongoing pharmacotherapy and psychotherapy, avoiding subject selection bias poses significant additional difficulties for the design of ECT studies, especially those comparing ECT to other therapies. Also, the side effects of confusion and memory loss potentially disrupt the blind status of the subjects, treatment staff, and raters. These are but a few of the critical design issues which need to be addressed and solved.

Fortunately, interest in ECT research has increased in recent years. As a result, increasing numbers of studies are being done using contemporary scientific designs and methodologies. The findings from several recent sham-controlled studies done in England demonstrate the effectiveness and safety of ECT as a treatment of endogenous depression (Freeman et al., 1978; Johnstone et al., 1980; West, 1981). Together with Ottosson's sophisticated series of studies in Sweden in the late 1950s, they demonstrate that the occurrence of a generalized central nervous system seizure is the essential therapeutic component. Further, the intensity of the electrical current inducing the seizure appears not to be related to therapeutic effect, but seems directly related to the primary side effects of ECT, post-ECT confusion, and memory impairment (Ottosson, 1960).

Therefore, research effort is being directed at more sophisticated issues than primary efficacy and safety. Considerable research effort is focusing on the nature, extent, and duration of the ECT-induced impairment in memory and other cognitive functions. The differential outcome of ECT techniques utilizing various electrical stimuli (brief pulse vs sine wave current) and electrode placements (unilateral nondominant vs bilateral position) is being assessed in terms of the side effects of memory and other cognitive function impairments as well as the therapeutic effect on depressive affect.

The following two papers by R. Weiner and C. Welch and their colleagues will focus on these issues. The final paper, by J. Small, will address aspects of two other critical issues in the efficacy area. The first issue is clinical indications for ECT. The second issue is the safety and efficacy of ECT compared to and combined with drugs. Dr. Small's presentation will present data on the combined use of ECT and neuroleptics in the treatment of schizophrenia. However, the question of safety and efficacy of ECT compared to and combined with optimal antidepressant therapy in the treatment of acute depression remains to be definitively answered.

While most endogenously depressed patients respond to pharmacotherapy, significant numbers of nonresponders are successfully treated with subsequent ECT (Paul et al., 1981). Clinical reviews also indicate the superior effectiveness of ECT for patients unable to take adequate doses of antidepressants for medical reasons (e.g., the elderly or patients with cardiac disease), and superior effectiveness for delusional or catatonic patients, and for severely ill suicidal or cachetic patients requiring a rapid response (APA, 1978; Fink, 1979). Thus, a critical area requiring investigation appears to be delineation and the definitive testing of clinical predictors or historical indicators for selecting ECT vs antidepressant medication as a first-line treatment for endogenous depression.

Finally, recent studies have shown that many patients who recover from an acute episode of major depression, whether treated with ECT or tricyclic antidepressants, have chronic course or become symptomatic again (Prien, 1981). Thus, the effectiveness of ECT, compared to and combined with antidepressants in preventing relapse or recurrences of new depressive episodes, requires investigation. Hopefully, the recent availability of potential biological markers of endogenous depression (e.g., dexamethasone suppression test, sleep electroencephalography (EEG) abnormalities) and techniques reassessing the adequacy of therapy (e.g., tricyclic antidepressant plasma levels, seizure time, and EEG changes with ECT) will facilitate the performance of definitive studies in these important areas.

Evaluation of the Central Nervous System Risks of ECT

Richard D. Weiner, M.D., Ph.D., [1,2] **Helen J. Rogers, Ph.D.,** [2] **Jonathan Davidson, M.B., M.R.C. Psych.,** [2,3] **and Robert D. Miller, M.D., Ph.D.** [2,3]

Introduction

Electroconvulsive therapy (ECT) is currently used as a treatment modality for severely ill psychiatric patients, particularly for major depressive disorders (Weiner, 1979). There continues to be controversy, however, with respect to ECT's risk/benefit considerations, a situation which is confounded by the widely varying types of ECT in use today, particularly in terms of electrode placement and stimulus waveform.

To help resolve this matter, a controlled prospective clinical study has been set up to investigate the acute and long-term effects of ECT upon memory, the electroencephalogram (EEG), and clinical status. In particular, this study considers the differential effects of stimulus electrode placement and stimulus waveform. As this is an ongoing study now in its third year, data collection and analysis have not been completed and only salient features of the data regarding the acute effects of ECT upon certain memory and EEG parameters will be presented here. Preliminary data regarding therapeutic response are reported elsewhere (Welch, Weiner, Weir, Cahill, Rogers, Davidson, Miller, & Mandel, 1981).

Methods

Experimental subjects have been referred for voluntary ECT treatment by their psychiatrists. All of those who meet Research Diagnostic Criteria (Spitzer, Endicott, & Robins, 1978) for major depressive disorder and have no evidence of preexisting central nervous system (CNS) impairment are subjected to a full series of test measures (memory, EEG, and clinical). ECT subjects who do not meet these criteria are tested only in terms of EEG. Control subjects meet all study criteria except for not being referred for ECT. Memory data will be presented on 33 experimental and 8 control subjects, while EEG data is presented on 40 experimental and 4 control subjects.

All experimental (ECT) subjects are randomly assigned to either unilateral nondominant or bilateral electrode placement and either sine wave or bipolar pulse stimuli. Standard modified ECT procedures are otherwise carried out, with the addition of EEG and stimulus energy monitoring.

[2] Department of Psychiatry, Duke University Medical Center, Durham, NC 27710.

[3] John Umstead State Hospital, Butner, NC 27059.

The number of ECT treatments is determined by the subject's psychiatrist on a clinical basis. No significant difference in age, sex, education, I.Q., or socioeconomic status among the various treatment groups was noted.

All testing is done prior to ECT, 2-3 days post completion of the treatments, and 6 months later (only the acute data will be presented here). Clinical measures have been discussed in part elsewhere (Welch et al., 1981). Memory measures include a variety of tests of anterograde and retrograde memory performance (for both dominant and nondominant hemispheric function). The personal, or autobiographic memory questionnaire focuses upon specific events relating to the subject's own life, particularly over the past year. A time frame which appears to be especially sensitive (Squire, Slater, & Miller, 1981) will serve as the memory measure presented below. In terms of physiologic abnormalities (Small, Small, & Milstein, 1978), both visual rating of EEG slowing and computer spectral analysis are utilized, with data from the latter being presented here. Testing is done blind with respect to subject group assignment, as indicated.

Results

The fraction of baseline personal memory items not remembered at the second testing session (2-3 days post completion for ECT experimental subjects) is shown in Figure 1. Analysis of variance shows control subjects to be *less* amnestic than ECT subjects ($p \leq .001$), and unilaterally treated subjects to be *less* amnestic than those receiving bilateral treatment ($p \leq .01$). A small trend for sine wave-treated subjects to be more impaired than those treated with pulse stimuli did not reach clinical significance ($p \leq .08$). Further statistical investigations revealed that the degree of apparent amnesia was *not* correlated with mean seizure length or total seizure duration, but *was* positively correlated with number of treatments ($p \leq .03$).

The difference in EEG slowing between the second testing session (2-3 days post completion of ECT for the experimental subjects) and the baseline measurements is shown in Figure 2. Analysis of variance shows control subjects to exhibit *less* slowing than ECT subjects ($p \leq .05$). Also, unilaterally treated subjects show *less* slowing than bilaterally treated subjects ($p \leq .02$). An additional finding, different from the memory results, is that subjects receiving pulse ECT show significantly *less* slowing than subjects receiving sine wave administration ($p \leq .01$).

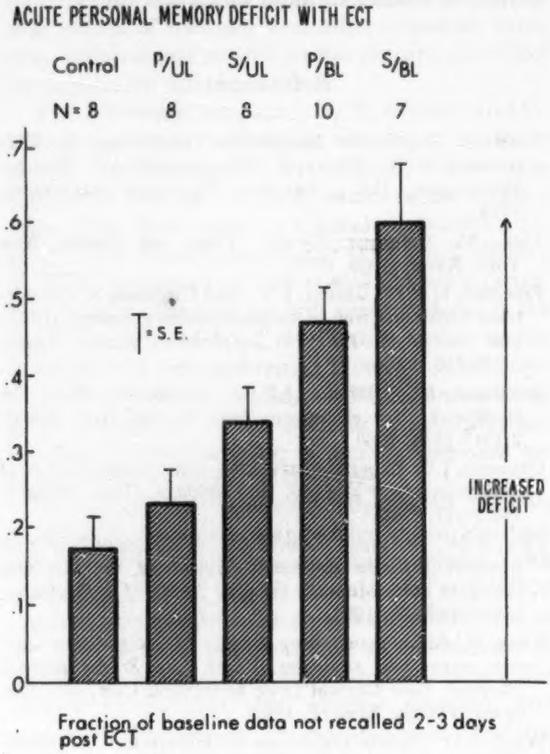

FIGURE 1

Discussion and Conclusion

The above findings indicate that the use of personal memory questionnaires and computerized EEG spectral analytic techniques can be used to extend the sensitivity of the assessment of CNS impairment following ECT. Acute personal memory impairment is less with unilateral nondominant electrode placement, as reported by

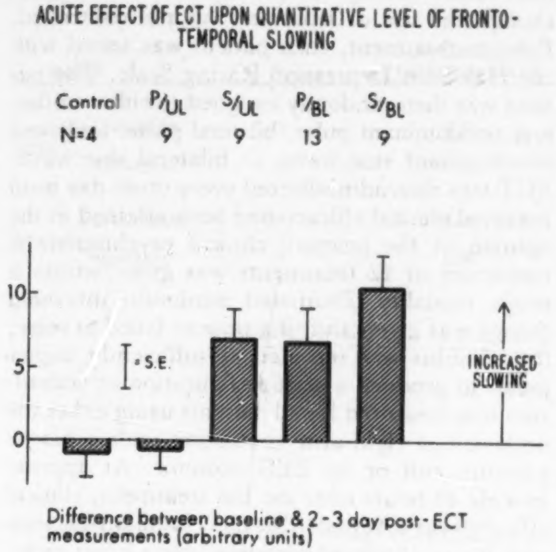

FIGURE 2

many others (e.g., Squire, 1977). No clear effect of stimulus waveform upon acute memory deficits is apparent, though a possible mild dysmnestic effect of sine wave stimuli requires further evaluation. In addition, the number of treatments, but not seizure duration, was found to exert a cumulative effect upon acute memory impairment, suggesting that, in general, brief electrically induced seizures appear to exert discrete effects upon memory performance.

In terms of acute EEG changes, unilateral nondominant ECT results in less slowing than bilateral ECT, while pulse ECT results in less slowing than sine wave ECT. This indicates that EEG slowing, which appears more sensitive to stimulus waveform than does amnesia, may represent a somewhat different phenomenon than amnesia, with the former being a nonspecific encephalopathic change, perhaps related to confusion, and the latter being a more specific effect of ECT, perhaps mediated through temporal lobe mechanisms.

Efficacy of ECT in the Treatment of Depression: Wave Form and Electrode Placement Considerations

Charles A. Welch, M.D.,[1] Richard D. Weiner, M.D.[2,3] Douglas Weir, M.D.,[1] Jane F. Cahill, R.N.M.S.,[1] Helen J. Rogers, Ph.D.,[2] Jonathan Davidson, M.B., M.R.C. Psych.[4] Robert D. Miller, M.D., Ph.D.,[2] and Michel R. Mandel, M.D.[4]

There is wide variation in electroconvulsive therapy (ECT) technique and little data to indicate which technique, if any, is must efficacious. The two most important variables are the position of the treatment electrodes on the head, and the shape of the electrical wave form. Many clinicians have strong opinions about the effect of these variables on efficacy, but studies to date have been inconclusive.

Bilateral fronto-temporal electrode placement is still the standard technique in this country, in spite of an increasing body of evidence that unilateral nondominant placement has less side effects (d'Elia, 1970; Squire, 1977) and that it may be equally efficacious (d'Elia & Raotma, 1975). Although existing studies vary widely in methodology, more rigorously designed studies tend to show equal efficacy, while those lacking control groups, blind raters, objective treatment criteria, or other important design features tend to show a differential in efficacy favoring bilateral.

Stimulus wave form has also been studied with respect to efficacy. Again, wide variations in methodology make it difficult to draw firm conclusions from the published studies. In the seven comparisons between sine wave and brief pulse performed since 1944, methodology varied widely, but several trends do emerge from this data (Weaver, Ives, Williams, & Nies, 1977; Weiner, 1980). In all but one study, sinusoidal and pulse wave forms were found to be equal in their ability to produce satisfactory seizures. Furthermore, pulse stimulation required less total energy to trigger a seizure, generally 50% or less than the energy required for sine wave stimulation. Clinical efficacy was found to be equal in all but one study, in which sine wave was found to be slightly more effective.

Unfortunately, a variety of different stimulus doses and electrode placements were used in these studies, and a clear comparison of wave forms, free of other variables, cannot be made. Furthermore, there has been no therapeutic comparison of wave forms using the vertex-temporal placement technique as described by d'Elia (1970). This placement requires less energy than the bilateral or other unilateral placements (Erman, Welch, & Mandel, 1979), appears to be equally efficacious, and is therefore clearly deserving of further study.

Because of the foregoing methodological problems, the present study was initiated with the intent to control simultaneously for variables of wave form and electrode placement. The objectives are to assess the previous findings: That unilateral ECT may be as effective clinically as bilateral ECT, and that brief pulse stimulus is as effective as sine wave stimulus.

Method

Patients in the study were referred for ECT on the basis of clinical indications, and most were resistant or intolerant to antidepressant medications. They were required to fit the Diagnostic Statistical Manual-III (DSM-III) criteria for major depressive episode with melancholia, and to have no evidence of preexisting cognitive impairment other than that consistent with depressive illness. All patients were free of antidepressant medication during the course of treatment, although the use of sedatives was not controlled. Prior to treatment, each patient was tested with the Hamilton Depression Rating Scale. The patient was then randomly assigned to either unilateral nondominant pulse, bilateral pulse, unilateral nondominant sine wave, or bilateral sine wave. ECT was then administered every other day until maximal clinical efficacy had been attained in the opinion of the primary clinical psychiatrist. A maximum of 12 treatments was given within a single modality. Estimated minimum threshold dosage was given and, if a patient failed to seize, the stimulus was repeated at sufficiently higher joules to produce a seizure. Duration of convulsion was measured for all patients using either the occlusion of right-arm circulation with a blood-pressure cuff or an EEG monitor. At approximately 48 hours after the last treatment, clinical efficacy was assessed with the Hamilton Depression Rating Scale administered by a blind rater. Efficacy was measured as reduction in raw Hamilton score from pretreatment testing to the score at 48 hours after the last treatment.

Results

Figure 1 compares the degree of improvement for each cell, and Figures 2 and 3 compare patients by electrode placement and wave form, respectively. Figure 1 indicates that the two unilateral cells had greatest mean improvement. Figure 2 shows a superiority of unilateral ECT over bilateral ECT that is statistically significant at the $\leq .05$ level. When the two centers are analyzed separately, the Duke data continue to show a statistically significant difference, while the Massachusetts General Hospital data show a trend in the same direction, although it is not statistically significant. Figure 3 indicates no significant difference in efficacy between the two wave forms.

Discussion

The finding that sine wave and brief pulse stimulus appear equally efficacious is not surprising in the light of previous research. Ottosson's (1960) milestone work indicated that a generalized grand mal seizure is the essential component of the treatment and that other variables such as mode of stimulus and severity of side effects were unrelated to ultimate efficacy. Subsequent clinical comparisons of wave form have continued to support the contention that how you trigger a seizure is unrelated to efficacy, but whether or not you trigger a seizure is related to efficacy.

The findings on electrode placement are somewhat more surprising. Although a number of investigators have found unilateral electrode placement to be just as efficacious as bilateral, this is the first randomly assigned prospective trial to find a greater efficacy associated with unilateral placement. The investigators' interpretation of these findings is that the bilateral group appeared less improved because of the greater cognitive side effects associated with that treatment at the time of measurement. It is possible that these placements are equally efficacious when the artifact of cognitive side effect is removed and this view, again, would be consistent with the work of Ottosson (1960) regarding the importance of the seizure itself.

While the investigators feel that it is premature to draw firm conclusions from their data until the study is completed, they also feel that the trends from this preliminary analysis are unlikely to change significantly as the study proceeds. The clinical importance of these findings is that there is probably at least equal efficacy with unilateral and pulse techniques in addition to markedly reduced side effects, compared with bilateral sine wave treatment.

ECT Combined with Neuroleptics in the Treatment of Schizophrenia[1]

Joyce G. Small, M.D.,[2] Victor Milstein, Ph.D.,[2] Marietta Klapper, M.S.,[2] Jeffrey J. Kellams, M.D.,[2] and Iver F. Small, M.D.[2]

The purpose of the present study was to assess the relative efficacy of neuroleptics combined with electroconvulsive therapy (ECT) compared with neuroleptics alone in the treatment of schizophrenia. Study patients met criteria (Feighner, Robins, Guze, & Woodruff, 1972) for schizophrenia. The design included randomization of treatment, placebo controls, a modified double-blind design, and short- and long-term followup. The majority of patients were assigned to treatment either with thiothixene hydrochloride or thiothixene combined with ECT. Fewer patients were assigned to placebo combined with ECT and still fewer to placebo alone. Nondominant unilateral ECT was employed with electroencephalographic monitoring to assure that major generalized seizures were induced. A standard rating scale battery (Levine, 1979) plus the Emotional Blunting Scale (EBS) (Abrams & Taylor, 1978) were employed. The Halstead-Reitan-Wepman Neuropsychological test battery (Reitan, 1966) was utilized for evaluation of cognitive impairment. Dosage of drugs and number of ECT were individualized, but a lower limit of 12 treatments for an ECT regimen was imposed. Video-taped samples of interview behavior were obtained for time-blind psychiatric ratings (Renfordt & Busch, 1976). Patients were assessed biweekly for the first 2 weeks and weekly thereafter for 6 weeks with followup at 6 and 12 months. Patients were maintained in the initially assigned treatment groups for as long as possible but were dropped because of patient refusal to continue, clinical deterioration, uncontrollable side effects, or insufficient therapeutic response. Treatment related dropouts were not replaced and were included in the statistical analyses by substitution of last active scores for missed evaluation points.

Seventy-five patients were enrolled in the study and randomly assigned to treatment. There were no differences between the treatment groups in terms of age, sex, education, duration of illness, nor in the pretreatment assessments of psychopathology.

Survival time on the study was one of the dependent variables examined. Patients on placebo, and placebo combined with ECT were dropped from the study significantly sooner than the others on an average of 11 and 19 days, respectively. Mean survival time was 46 days for thiothixene-ECT and 60 days for thiothixene. The difference between the latter two was not statistically significant. Reasons for study termination were similar in the four treatment groups. The only difference was that compliance with taking medications was better in the ECT-treated patients.

There were no significant differences in doses of neuroleptics or corresponding amounts of placebo in the three active treatment groups. More anticholinergic agents were used in the patients treated with thiothixene alone. The two ECT groups received a series of 15 treatments on the average. The seizures were shorter in the thiothixene-ECT combined group than in the patients on placebo with ECT, 37 seconds compared to 43 seconds.

Neuropsychological test data revealed no group differences before treatment. Afterwards there were indications of greater impairment of performance in the thiothixene – ECT group in comparison with performance of patients receiving

placebo—ECT. This was true for tests involving right, left, or both hemispheres. Dosage of neuroleptic or anticholinergic medication was not associated with impaired test performance.

Two-way analysis of variance for repeated measures of the four treatment groups over the nine assessment periods yielded significant treatment group and time effects with no significant interactions. On the Clinical Global Impression Scale the majority of significant differences favored the thiothixene-ECT combined group in comparison to the placebo-ECT and placebo reference conditions. There were no statistically significant differences between the two groups receiving active drug. The Brief Psychiatric Rating Scale (BPRS) discriminated between the thiothixene patients and those treated with placebo-ECT or placebo, favoring the former on factors of thinking disturbance and anxiety-depression. The drug-ECT combination group did best in areas assessed by the EBS. The Abnormal Involuntary Movement Scale (AIMS) indicated that patients given neuroleptics alone had more orofacial movements than the other treatment groups.

The overall conclusion was that thiothixene alone and thiothixene combined with ECT are both effective treatments of exacerbations of schizophrenia as compared to the reference groups which received placebo and unlateral ECT or placebo alone. The course of treatment with thiothixene-ECT was smoother, with fewer problems with drug compliance, less apathy, withdrawal and indifference, fewer movement disorders, and other side effects as well as overall better global improvement and therapeutic efficacy. There were no differences in survival time on the study, duration of hospitalization, or disposition on discharge, but family adjustment in those patients living at home was significantly better in the ECT-combined group than for those who received neuroleptics alone. There was more impairment in neuropsychological test performance with drug-ECT combined than with ECT without active drugs, and seizures were shorter, although these differences may not by clinically important. Neuroleptics alone were more effective in controlling signs and symptoms assessed by BPRS factors of thinking disturbance and anxiety and depression.

The conclusion is that neuroleptics combined with ECT and neuroleptics alone are useful therapeutic interventions in schizophrenia, each with a somewhat different symptomatic profile. Projected followup investigations may determine whether or not there are long-range advantages to either form of treatment.

Predictability of Treatment to Response to Diazepam at Several Points During the Course of a 6-Week Drug Trial[1]

Robert W. Downing, Ph.D.,[2] and Karl Rickels, M.D.[2]

Among the aims of a recently completed large-scale study of diazepam treatment in patients suffering from chronic anxiety is the determination of predictors of response to both an acute (6 weeks) and a maintenance (6 months) treatment phase of the trial. The present report deals with a preliminary investigation of the predictability of treatment response at several points during the course of the acute phase of the study (after a 1-week placebo washout period, and after 2, 4, and 6 weeks of treatment with diazepam). It is also concerned with the contributions to predictability made at each of these points by each member of a small set of predictors, selected either on the basis of the predictive role they have played in previous studies (age, social class, presence or absence of previous treatment, and the severity of initial anxiety and initial depression), or because of theoretical considerations (Eysenck Neuroticism and Precipitating Stress).

Of the 133 primarily anxious, nonpsychotic outpatients included in the present investigation, 59% were female, 81% white, and 62% married. Mean age was 42.7 ± 12.6 years. Class IV formed the modal socioeconomic level (47%), but the remaining classes were well represented (I-II, 12%; III, 23%; V, 18%). In terms of illness-related factors, 38% of the group had been ill for 3 or more years; 62%, for 1 or more years. Seventy percent of the sample had received previous treatment for emotional problems. Mean score on the Covi Anxiety Screen was 10.4 ± 1.7, and on the Raskin Depression Screen, 6.8 ± 1.83. Precipitating stress was reported for 50% of the group.

The seven independent variables listed in the Table were employed as regressors in a standard multiple regression procedure to assess the predictability of 7-point scale physician ratings of Global Improvement (1 = very much better, 7 = very much worse) after the 1-week placebo washout period and after 2, 4, and 6 weeks of treatment with diazepam (20-40 mg/d). In addition to the multiple R's and R^2's obtained at each time period, the Table includes the partial *r* of each regressor with improvement. The signs of each partial *r* have been adjusted so that the indicated class (e.g.; Previous Treatment: Yes) or dimensional extreme (e.g.; Eysenck Neuroticism: High) are associated with greater improvement when *r* is positive and with lesser improvement when *r* is negative for that variable.

Table

Predictors of Physician Rated Global Improvement After a 1-Week Placebo Washout and After 2, 4, and 6 Weeks of Treatment With Diazepam for 113 Anxious Patients

			Diazepam	
	Placebo	Week 2	Week 4	Week 6
	r_p	r_p	r_p	r_p
Age: Old	00	13	02	06
Previous Treatment: Yes	-16†	-18*	-21*	-30§
Neuroticism: High	-15†	-18*	-14	-19*
Social Class: High	03	21*	22**	11
Precipitating Stress: Yes	16†	06	22**	20*
Covi Anxiety: High	26**	-04	06	02
Raskin Depression: High	-06	-04	-24**	-12
R	.38	.35	.43	.41
R^2	.141	.122	.188	.167
P	.007	.02	.0005	.004

* *p* .05
** *p* .01
† *p* .10
§ *p* .001

The percentage of predicted variance ranges from 12.2% at 2 weeks to 18.8% at 4 weeks. An examination of the R's and R^2's across the four points at which they are assessed provides no evidence of a reliable shift in predictability between the first and seventh weeks of treatment. Predictability after 6 weeks of diazepam treatment is at least as high as it is at any of the previous assessment points. The temporal configuration of the contributions made to predictability, however, varies widely across the set of independent variables employed. Patient age, despite its implications for the kinetics of benzodiazepine metabolism and its putative role as at least a rough indicator of physical, psychological, and social functioning remains uniformly unrelated to treatment response. In contrast, the contribution made by the presence/absence of previous treatment for emotional problems shows a monotonic increase across assessment periods with those patients who have sought previous treatment manifesting the least improvement. The presence of a condition requiring further treatment after previous treatment was obtained would appear to impose tangible limits upon the capacity for treatment response; this factor accounts for 9% of treatment response after 6 weeks of diazepam treatment.

[2] Psychopharmacology Research and Treatment Unit and the Private Practice Research Group, Department of Psychiatry, University of Pennsylvania, Philadelphia, PA 19104.

Higher scores on the Eysenck Neuroticism scale manifest a modest, but consistently negative impact upon treatment response across all assessment periods. This purported measure of potential for neurotic functioning emerges as sufficiently independent of the predictive impact of presently anxious and depressive symptomatology to make a significant contribution ($p < .05$) after 2 and after 6 weeks of diazepam treatment. Higher socioeconomic class affiliation has a positive implication for response to active drug but not to placebo, while the occurrence of precipitating stress implies more adequate response to both placebo ($p < .10$) and to active drug. More severe presenting anxiety (Covi Screen) is associated with greater response during the placebo washout period but is unrelated to subsequent drug response. More severe presenting depression (Raskin Screen) has negative implications for drug response which are statistically significant at only the 4-week point. Generally, it may be concluded that more adequate treatment response is experienced by those individuals with greater material, personal and social resources supportive of adequate functioning.

Issues in Long-Term Treatment with Diazepam[1]

Karl Rickels, M.D.,[2] W. George Case, M.D.,[2] and Robert W. Downing, Ph.D.[2]

A diazepam maintenance drug trial, initiated several years ago, is presently in its last study phase and all patients have been entered into the trial. This report is based on completed patient data available as of April 1981.

The acute single-blind study phase called for a 1-week placebo washout period and a 6-week active drug treatment period where diazepam was prescribed in daily dosages ranging from 20-40 mg with an average dose of 25 mg/day. Improved patients or patients hoping to derive more benefit through longer diazepam treatment then entered an 18-week double-blind maintenance phase.

One-third of all patients entering the maintenance phase were switched to placebo at the onset, one-third after 8 weeks in the maintenance phase, i.e., after a total diazepam period of 14 weeks, and one-third of patients after 16 weeks in the maintenance phase or a total number of 22 weeks on diazepam. For all patients completing 22 weeks of diazepam treatment, two additional placebo weeks with weekly visits were added. Followups were conducted 3 and 12 months after the patient completed the maintenance phase.

Only chronically anxious, nonpsychotic patients of both sexes between 18 and 65 years of age who were anxious for at least 3 months, and whose mean chronicity was more than 1 year, were initiated into the study. Their initial Covi Anxiety score was at least 8 and their Hamilton Anxiety score at least 18. Of more than 350 anxious patients entering the placebo washout period, 158 patients so far have completed the maintenance phase, either by completing all 24 weeks of the program or by dropping out earlier for various reasons (e.g., return of symptoms or withdrawal reaction).

---

[1] This research was supported by USPHS Research Grant MH-08957.

[2] Department of Psychiatry, University of Pennsylvania, Philadelphia, PA 19104.

The following preliminary findings have been obtained so far:

1) Clinical improvement observed during the first week of diazepam treatment was a highly significant predictor of a 6-week diazepam treatment response ($p < .001$), with almost 90% of patients reporting "much or very much" improvement after only 1 week of treatment being markedly improved after 6 weeks of treatment. The representative improvement percentage for patients reporting at 1 week only minimal improvement is 45%, and for patients reporting no improvement or getting worse after 1 week is 20%.
2) No tolerance to the diazepam effect developed in improved patients over the total 22 weeks of diazepam treatment.
3) Patients experienced maximal improvement during the initial 6 weeks of treatment, and no additional improvement could be produced in any patient during the entire maintenance phase, even when dosages were increased to a daily maximum of 40 mg/day.
4) Return of symptoms after an abrupt change from diazepam to placebo after 6 weeks of diazepam treatment occurred in 45% of all patients. In those patients who continued 22 weeks on diazepam, the return of symptom rate was reduced to 25%. Thus, about 55% of chronically anxious patients with a mean chronicity of more than 1 year needed only 6 weeks of diazepam treatment to become symptom free and to maintain this freedom for at least several months while on placebo medication.
5) Withdrawal reactions were reported by 20 out of 158 patients (13%). Two withdrawal reactions occurred in patients who were on diazepam for only 6 weeks, ten in patients who were on diazepam for 14 weeks, and eight in patients who were on medication for 22 weeks. Seven of these 20 patients had only very transient reactions that lasted for only a few days and had disappeared 1 week later. Some of these patients reported temporary sleep problems and one patient stated that he felt slightly anxious for 3 days, similar to when he stopped smoking. The withdrawal reaction in the remaining 13 patients were clear withdrawal reactions which occurred within 2-3 days after abrupt diazepam withdrawal and shift to placebo; these symptoms peaked during Days 5 to 7 and disappeared with or without treatment within a few weeks, as was recently reported by Winokur et al. (1). Table 1 summarizes those withdrawal reactions reported by most of the 13 patients.

Table 1

Diazepam Withdrawal Symptoms

Extreme Distress
GI Symptoms (Nausea, Diarrhea, or Constipation)
Diaphorosis
Tremor
Lethargy
Dizziness
Increased Acuity for Sound and Smell
Restlessness
Insomnia
Tinnitus
Feelings of Depersonalization
Difficulties Expressing Thoughts Coherently
Headaches
Irritability
Anxiety
No Convulsions
No Psychotic Reactions

Further examination of our data made it quite clear that withdrawal response could not be looked at only as a function of study medication but had to be viewed in the context of medication taken prior to entering the 1-week placebo washout period. In fact, close inspection of prior drug treatment data indicated that 4 of the 13 patients with clear withdrawal reactions should never have entered our study, since they demonstrated existing clear-cut withdrawal reaction during the placebo washout period. Incidences of withdrawal reactions, irrespective of whether they were mild or severe, are given in Table 2 as a function of total consecutive prior sedative-benzodiazepine intake. Table 2 indicates clearly that chances to develop withdrawal reactions to an abrupt withdrawal of diazepam used in medically acceptable daily dosages of 15-40 mg increases with length of prior sedative treatment. No withdrawal reactions were seen prior to 14 weeks of benzodiazepine treatment; the two withdrawal reactions occurring after 6 weeks of study medication occurred in patients who had been on long-term benzodiazepine use and in fact had already had a withdrawal reaction during the placebo washout period. The three patients who developed clear-cut withdrawal reactions after only 14 weeks of diazepam and without a history of prior sedative drug use were heavy social drinkers, and the question at least should be raised whether this drinking habit may have contributed to the occurrence of withdrawal symptoms.

Table 2

Withdrawal Reactions After Abrupt Discontinuation of Diazepam Treatment as Function of Prior Sedative Drug Use*

	No Withdrawal	Withdrawal
No Prior Sedative	83	6 (7%)
Prior Sedative <8 Months' Duration	38	3 (7%)
Prior Sedative ≥8 Months' Duration	17	11 (39%)

$\chi^2 = 21.83$; $N = 158$

*Patients who terminated on diazepam are counted as "No Withdrawal."

6) Major factors found to contribute to diazepam withdrawal are the following: a) abrupt discontinuation of treatment; b) continuous treatment for at least 4 months' duration in therapeutic dosages; c) the longer the treatment duration with a sedative-benzodiazepine, the higher the chance of withdrawal reactions to occur even in therapeutic dosage; d) however, since many patients with years on benzodiazepine medication did not develop withdrawal reactions in our study, other as yet unknown factors need to be determined.

7) The time course of withdrawal reactions produced by abrupt benzodiazepine discontinuation indicates a swift development of symptoms, peaking after 5 to 7 days and slowly receding over the next 2 to 4 weeks. These symptoms are frequently not only different from the symptom the patient originally had, but also much more disturbing. However, many patients experience only very mild symptoms, lasting only a few days. In contrast, return of symptoms shows a much different time course. Symptoms usually develop over 2 to 4 weeks and once they are fully developed do not disappear without additional treatment. The symptoms also are usually of the same type as the patient's original symptoms and they are generally of less severity and never of more intensity than they were prior to initiating treatment.

8) Based on our experience gained in this maintenance study, we suggest the following guidelines to prevent or treat such symptoms: a) Decrease daily dosage by 2.5 to 5 mg but not more than one-fourth the daily dose every 1-2 weeks. b) Patients with transient reactions, short-lasting symptoms, or patients who do not mind suffering through their withdrawal reactions, may not need any treatment at all, at least when diazepam, a drug with a long half-life, is involved. Convulsions or psychotic reactions were not observed in our study. c) Original symptoms may frequently return. They are never as abrupt, distressing, and different from original symptoms than withdrawal reactions.

9) Finally, 96 patients who completed the maintenance phase were followed by mail interview 12 months after completion of the study. Table 3 gives results from the 1-year followup. These results are most disturbing. Of the 96 patients for whom data are available, 59% were symptomatic at time of followup, this despite the fact that all patients were asymptomatic while on diazepam; and of the 57 symptomatic patients, less than 50% were treated for their symptoms. This treatment involved not only benzodiazepines, but also tricyclic antidepressants (TCA) and neuroleptics. Interestingly, none of these 27 patients had entered psychotherapy or other nondrug treatments. While the use of TCAs is probably appropriate since patients may have become depressed, the use of neuroleptics in seven patients subjects these patients to potentially more dangerous drugs than the benzodiazepines.

10) In summary, more than 50% of chronically anxious patients need at the most only 6

weeks of treatment with diazepam to remain symptom free. Those patients who need continued maintenance treatment do not develop tolerance to their medication, but also do not continue to improve beyond the improvement levels they had reached after 6 weeks of treatment. A return of symptoms is usually indicated by a slow onset and a recurrence of symptoms which are similar to the ones originally present. Withdrawal reactions due to abrupt discontinuation of diazepam range from mild and transient to more severe and very disturbing. They show a rather acute onset, with symptom intensity peaking after 5 to 7 days and with symptoms being much more disturbing than the original symptoms present prior to treatment. These symptoms include many symptoms not present originally. Withdrawal reactions can be prevented in most patients by stepwise reduction of dosage.

Behavioral Assessment of Drug Effects in Obsessive-Compulsive Disorders

Samuel M. Turner, Ph.D.[1]

Research can only advance as far as is permited by our measurement technology. Yet, it is a truism in clinical research that the technology of measurement lags significantly behind research endeavors. The quantity of research appears to exceed what can be justified from the standpoint of measurement quality. Clinical research typically grows out of the existence of interesting and significant clinical problems, and the need to develop some information about pathological behavior in the clinical arena. Thus, there is often little primary attention given to the perplexities of measurement issues.

Clinical studies are often designed to compare treatments with one another, placebo, or no treatment. A typical set of measurements consists of one or more of the following: patient self-report, clinical ratings, and paper and pencil inventories. It is not that there is anything wrong with applying these measures; rather, it is a question of whether or not this represents a completely adequate measurement strategy for the phenomena under consideration. The proper measurement system is essential if treatments (or no treatment) are to be adequately evaluated. A measurement strategy must be developed for a given disorder according to the phenomena under study as well as logical, theoretical, and practical considerations.

In recent years, there has been increased optimism in our thinking concerning the treatment of obsessive-compulsive disorder. Throughout the history of psychiatry, this disorder has been noted for its resistance to most forms of treatment (Grimshaw, 1965; Kringlen, 1965). However, recent studies with pharmacological (Thorén, Åsberg, Cronholm, Jörnestedt, & Träskman, 1980; Thorén, Åsberg, Bertilsson, Mellstrom, Sjöquist, & Träskman, 1980), surgical (Bridges, Goktepe, & Martos, 1973; Mitchell-Heggs, Kel-

ly, & Richardson, 1976) and behavioral interventions (Rachman, Cobb, Grey, MacDonald, Mawson, Sartori, & Stern, 1979; Turner, Hersen, Bellack, Andrasik, & Capparell, 1980; Turner, Hersen, Bellack, & Wells, 1979) have produced encouraging results with relatively brief periods of treatment. In most instances, psychosurgery would not be considered an appropriate treatment in this country. Therefore, drug treatment and behavior therapy appear to be the treatments of choice.

Obsessive-compulsive disorder is characterized by recurrent or persistent ideas, images, thoughts, or impulses. These are typically accompanied by an urge to engage in some overt or covert act, usually of a repetitous nature. Along with these subjective symptoms are the well-known behavioral abnormalities which include rituals such as hand washing, checking, and various avoidance behaviors. Rituals often significantly interfere with normal daily functions such as bathing, eating, toileting, and grooming. Moreover, social, economic, vocational, and interpersonal disfunctions may be experienced. In addition, varying degrees of depression and anxiety are an integral part of the syndrome.

Given the complex behavioral and physiological (biochemical) dimensions of the disorder, it is essential that a multifaceted measurement system be employed in research studies. This is rendered even more important if one desires to study the poorly understood relationship of depression and anxiety to obsessive-compulsive disorder. Presently, even the best studies of drugs (e.g., Rachman et al., 1979; Thorén et al., 1980 a,b) employed a set of incomplete outcome measures. Any measurement strategy should involve assessment of self-report, overt behavior, and physiological changes. That results may vary dependent upon the channel of measurement employed is a well-know phenomena. For example, following behavioral treatment, phobics may be able to approach formerly fear-inducing stimuli but still indicate by self-report that they are fearful, while changes in physiological indicators are consistent with their new behavior. This discrepancy among channels of measurement has been labeled desynchrony by Rachman and Hodgson (1974).

Keeping the tripartite measurement system described above in mind, listed below are the elements of an adequate measurement system for employment in obsessive-compulsive research. First, there should be some type of self-report measurement of obsessive ideation. This should consist of paper and pencil inventories, interview ratings, daily self-monitoring, or some combination. Specific measurement of overt ritualistic behavior is best obtained through direct behavioral observations as illustrated by the Turner et al. (1979, 1980) studies. Unfortunately, such direct observations are not always practical. Therefore, some form of self-report or interview ratings might also be necessary.

When direct observational data cannot be obtained, one way to remedy the stituation is to employ a behavioral avoidance test similar to those used in phobic research. Anxiety should be measured in all three measurement channels. Self-report data can be obtained via daily ratings of tension, interview ratings, or paper and pencil inventories. Behavioral data can be obtained by direct observation of operationally defined anxiety behaviors (e.g., fidgeting or hand-wringing). Physiological processes are probably more appropriate in anxiety measurement than in any of the other aspects of obsessive-compulsive disorder. Such measures as heart rate and galvanic skin response (GSR) would be appropriate. However, in the obsessive-compulsive syndrome, another set of physiological measures is necessary if we are to understand the mechanism by which drug effects are obtained. These are biochemical measures such as the ones employed in the Thorén (1980) and Rachman et al. (1979) studies. Depression can be measured by a number of self-report scales. It can also be measured by interview ratings, and through direct behavioral observation. Finally, some type of measurement of social functioning should be employed to assess all relevant social role areas. Such social functioning data should be obtained from the patient himself as well as from significant others. An outline of the use of the tripartite measurement system in obsessive-compulsive disorder is presented in Table 1.

Prior studies in obsessive-compulsive disorder had typically grouped all of the obsessional states together and treated them with drugs or some other form of treatment. Yet, it appears from the clinical literature that subgroups of obsessive-compulsive patients might exist. If there are in

**Physiological measures include biochemical assays.

fact important differences among types of obsessives, it is essential to begin developing classification systems so that the effects of treatments can be clearly defined. For example, Mavissakalian (1980) proposed a "functional" classification of obsessive-compulsive phenomena (*see* Table 2). Although the clinical and theoretical value of this system has not been established, it is a beginning in an area that has lacked serious investigation.

Considerable evidence has accumulated to suggest that antidepressants such as clomipramine are an effective treatment agent for obsessive-compulsive disorder. Moreover, there is recent evidence to suggest that a specific dose range is more effective than others, and that the proposed mechanism of change is suppression or the reuptake of serotonin. Yet, it was suggested above that the measurement strategies employed in previous studies were not wholly adequate. Therefore, it is difficult to assess the value of drug treatments at this time. Finally, a word of caution is also in order concerning the sample size used in experimental studies. Given the number of measures needed to adequately assess the obsessive-compulsive syndrome (*see* Table 1), it is evident that multivariate procedures may be required, or at least adjustment of significance levels. Moreover, in order to obtain adequate statistical power (cf. Agras & Jacob, 1981) when comparisons of active treatments are made, sample sizes far in excess of what typically is employed will be required. The presence of obsessive-compulsive disorder is consistently estimated to be low in comparison to other anxiety disorders. Therefore, in order to conduct a study with with the proper sample size, multicenter studies might be necessary.

Table 2

Functional Classification of Obsessive-Compulsive Phenomena

Obsessions—noxious cognitive stimuli such as intrusive thoughts, images, feelings and impulses

Obsessions Plus Compulsions (Anxiety Reducing)—behaviors which attempt to neutralize obsessions and reduce anxiety, discomfort (washing, checking, other cognitions, etc.)

Obsessions Plus Obsessionalized Compulsions (anxiety augmenting)—development of obsessional secondary phenomena

Rituals (Autonomous Compulsions)—rituals are disassociated from the anxiety/discomfort producing obsessions

Effect of Des-Tyr-γ-Endorphin in Schizophrenia

Herbert Y. Meltzer, M.D.,[1] Daniel A. Busch, M.D.,[2] John Lee, M.D.,[3] and Yiannis Papacostas, M.D.[3]

Des-tyr-gamma-endorphin (DTγE) is a peptide which may occur endogenously, (Verhoef, Loever, Burbach, et al., 1980), and which has been shown in animal studies to have some behavioral, biochemical, and electrophysiological effects which are comparable to those of classical neuroleptics (de Wied, Bohus, van Ree, et al., 1978; Nickolson, & Berendsen, 1980; Pedigo, Schallert, Overstreet, et al., 1979; Schoemaker, & Nickolson, 1980). There are also significant differences between DTγE and neuroleptics, such as inability to produce catalepsy or block apomorphine-induced stereotypy (de Wied, Kovacs, Bohus, et al, 1978; Weinberger, Arnsten, & Segal, 1979). This profile has led to a series of clinical trials designed to determine if DTγE has antipsychotic properties in man. As with many antipsychotic compounds, early results were very favorable, indicating that doses as low as 1 mg/day intramuscularly (i.m.) for as brief a period as 3 days produced considerable improvement in both chronic and acute schizophrenic patients, although the results were far from uniform

(Emrich, Zandry, Zerssen, et al., 1980; van Ree, de Wied, Verhoeven, & van Praag, 1980; Verhoeven, van Praag, Botter, et al., 1978; Verhoeven, van Praag, van Ree, & de Wied, 1979). No extrapyramidal side effects were noted. More recently, entirely negative results have been reported in schizophrenic patients with and without tardive dyskinesia (Casey, Korsgaard, Gerlach, et al., 1981; Tamminga, Tighe, Chase, et al., 1981).

Method

This study included two groups of subjects. The first consisted of eight newly hospitalized schizophrenic patients at the Illinois State Psychiatric Institute who were diagnosed schizophrenic according to Research Diagnostic Criteria (Spitzer, Endicott, & Robins, 1977). Six were chronic, one subacute, and one acute. There were five males and three females; the mean age was 24.8 years. Following admission, the patients were kept off active medication for a period of 9 to 25 days. There was no appreciable symptom change during this time. Treatment with DTγE was begun with an initial dose of 1 mg i.m. daily for at least 3 days. The dose was randomly adjusted on an open basis to 3-10 mg/day for the rest of the 12-day treatment period. The maximum dose was 3 mg/day in four patients, 5 mg/day in two patients, and 10 mg/day in two patients. Following treatment with DTγE, patients were not given active medication for at least a week. Clinical change was assessed with the Schedule for Affective Disorders and Schizophrenia (SADS) (Spitzer & Endicott, 1980), the Global Adjustment Scale (GAS) (Endicott, Spitzer, Fleiss, & Schen, 1976), and the Nurses' Observation Scale for Inpatient Observation (NOSIE) (Honigfeld, Gillis, & Klett, 1966).

The Hoffman-reflex (H-reflex) recovery curve (Metz, Busch, & Meltzer, 1981) and platelet monoamine oxidase (MAO) activity (Jackman & Meltzer, 1980) were determined at the end of the placebo period as well as during and after the post-DTγE treatment period. Serum prolactin levels were determined by radioimmunoassay.

The second group of subjects consisted of seven patients hospitalized at the Veterans Administration Hospital or University Hospital at Stony Brook. Seven schizophrenic patients were treated with DTγE in doses of 1-4 mg/day for 14-21 days. Clinical evaluation was by means of the Brief Psychiatric Rating Scale (Overall & Gorham, 1962) and the Clinical Global Scale.

Results

The overall clinical impression of the research staff was that two of the eight Chicago patients showed marked clinical improvement, four showed minimal to moderate improvement, and two showed no change. Changes in GAS scores were in the direction of improvement in seven of eight patients (*see* Figure). These improvements were slight, but of the order of magnitude noted in other schizophrenic patients in the author's research unit who have been treated with classical neuroleptic treatment for a comparable period. Improvement was mainly in the area of social functioning. Patients became less withdrawn and more sociable and cooperative. Reports of delusions and hallucinations decreased in the responses given during SADS interviews, but clinical staff did not believe meaningful improvement occurred in these areas. Improvement in social functioning began within the first 3-7 days of treatment and did not appear to be dose-related. No extrapyramidal or other side effects were noted. After discontinuation of DTγE, six of eight patients showed deterioration. Considerably greater improvement was noted in these patients during the neuroleptic treatment period which followed DTγE. One of the two apparent good responders to DTγE failed to show any improvement on DTγE when treated with a subsequent course of DTγE upon rehospitalization 6 months later.

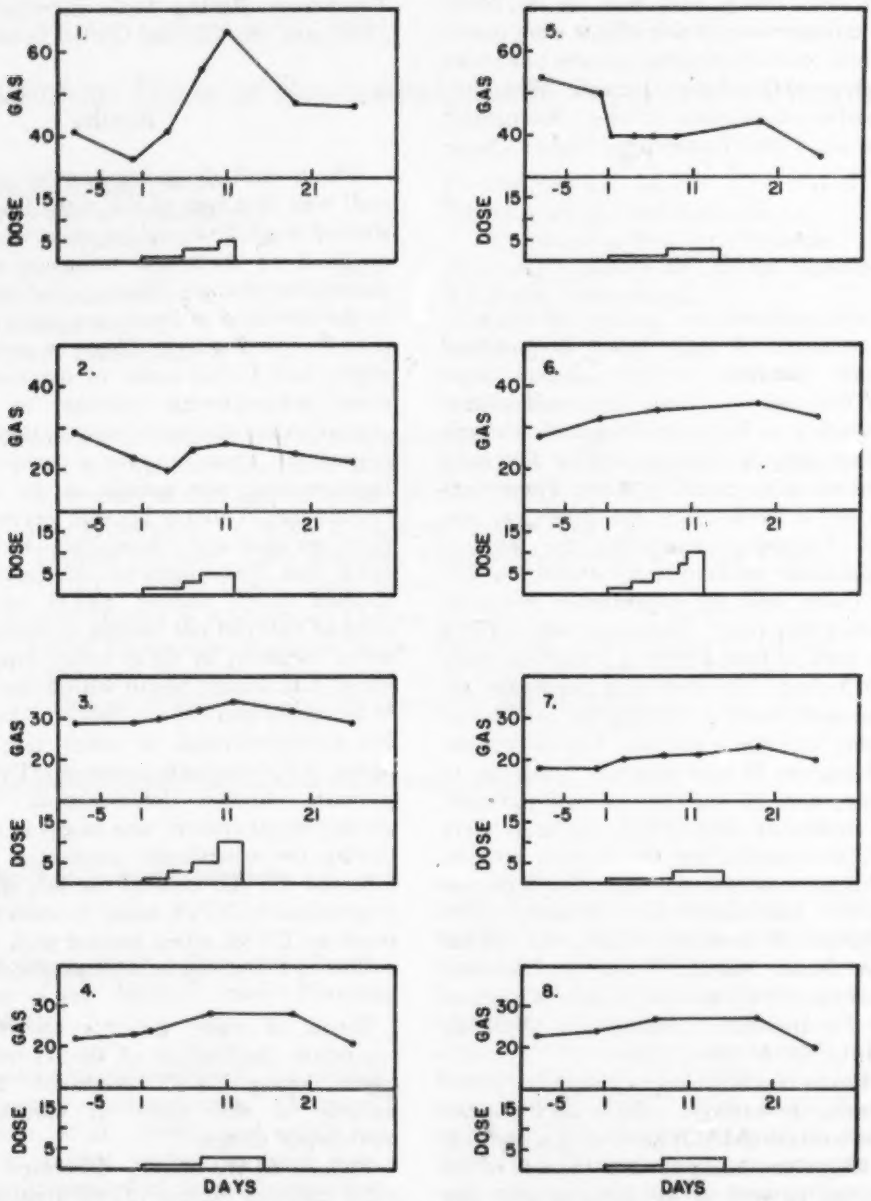
Seven of eight patients showed decreased secondary facilitation of the H-reflex recovery curve during DTγE treatment. This is comparable to the effect of clinically effective neuroleptic drugs.

Platelet MAO activity decreased in six of the eight patients during DTγE treatment. This is also comparable to the effect of neuroleptic drugs.

No change in serum prolactin levels was observed for up to 4 hours after injection of 1 mg DTγE.

Of the seven Stony Brook patients, one chronic

GLOBAL ASSESSMENT SCALE BEFORE, DURING AND AFTER DTGammaE



schizophrenic patient who had failed to respond to neuroleptic treatment showed marked, persistent clinical improvement of both positive and negative symptoms, and two showed moderate but transient improvement. No effect of DTγE on serum prolactin levels was noted.

Discussion

The clinical change during the period of treatment with DTγE was not impressive on an overall basis. An open study such as this has significant biases toward a type II error because of the high expectations of patients and staff of a novel antipsychotic agent. The major clinical improvement was noted in areas of behavior which are least objective to assess and most sensitive to high expectations for some improvement. The failure to obtain improvement in positive symptoms comparable to that produced by neuroleptic treatment is suggestive that DTγE is less effective than classical neuroleptic drugs if indeed it is active at all.

We did find two biological measures of activity of DTγE: the H-reflex and platelet MAO. The effects on these parameters were those produced by classical neuroleptic drugs. This is encouraging in that there may indeed be an in vivo neuroleptic effect of DTγE.

A double-blind, placebo-controlled study of DTγE for longer periods of time in a larger sample seems indicated, despite the meager clinical improvement demonstrated here because of the evidence of biological effects of DTγE. It may be that only a small proportion of subjects would respond clinically to this peptide because of heterogeneity of schizophrenia or because of differences in absorption and metabolism of DTγE.

Vasopressin Studies in Alzheimer's Disease

Carol A. Tamminga, M.D.,[1] Raymon Durso, M.D.[1] Paul Fedio, Ph.D.[1] and Thomas N. Chase, M.D.[1]

Recent advances in peptide pharmacology are suggesting areas for therapeutic application of exogenous peptides in human disease. Vasopressin, identified since 1950 as a cyclic-nine amino-acid peptide involved in sodium excretion and smooth muscle contraction, has been shown to facilitate animal learning and memory in behavioral testing. Peripherally administered vasopressin delays extinction of learned behaviors in a variety of animal learning paradigms (Ader & de Wied, 1972; Bohus, Gispen, & de Wied, 1973; de Wied, 1971; de Wied, Greven, Lande, & Witter, 1972). Furthermore, Brattleboro rats, which on a genetic basis lack vasopressin, learn behaviors more slowly and extinguish learned behaviors faster than control rats; this defect is corrected by the exogenous administration of vasopressin (de Wied, Bohus, & Wimersma, 1975). Moreover, analogues of vasopressin have been shown to block the effects of CO_2-induced retrograde amnesia in rats tested in a passive avoidance task (Rigter, Riezen, & de Wied, 1974). Recent uncontrolled trials of vasopressin in human memory-losing disorders (Weingartner, Gold, Ballenger, et al. 1981; Oliveros, Jandali, Timsit-Berthier, et al. 1978; LeBoeuf, Lodge, & Eames, 1978; Blake, Dodd, & Evans, 1978) as well as in normal individuals (Weingartner et al., 1981; Legros, Gilot, Seron, et al. 1978) have encouraged further controlled testing.

Method

Lysine vasopressin was administered in a double-blind, placebo-controlled design to patients with mild to moderate symptoms of Alzheimer's-type dementia. Patients were included if they had a progressive history of memory loss and cognitive deficit, documented by the Wechsler Adult Intelligence Scale (WAIS) and the Wechsler Memory Scale (WMS), without any evidence of focal brain impairment or other diagnosable cause of dementia. The study design was a non-crossover type using seven patients in each of two groups, one of which received 16 units per day of vasopressin administered intranasally, the other, an equivalent quantity of nasal spray carrier for 10 days. Subjects were evaluated with memory and performance tests prior to, during, and for 7 days following the intranasal treatment. The tests administered were selected to measure aspects of learning, memory, attention, and perception in each of the patient participants. At baseline, the WAIS and the WMS were done to confirm the diagnosis of Alzheimer's disease, and the initial battery of learning tests was applied. The specific learning and memory tests carried out were: 1) word list learning with free recall and selective reminding; 2) paired associate learning for immediate and delayed recall; 3) memory retention for a 20-item paragraph-long prose passage in immediate and delayed recall; 4) memory retention for photographs of common objects; 5) reaction time using a standard key-press machine with either fixed or variable forewarning period; and 6) perception capacity with a tachistoscope projecting patterns and words to the central visual field.

Results and Discussion

Results showed no difference in learning or memory between lysine vasopressin (LVP)-treated and placebo-treated subjects. Immediate recall and learning were unchanged in word list and paired associate learning and in the memory retention tests. Delayed recall testing, included to measure aspects of memory storage and recall, also remained unchanged. However, the tests of fixed alerting-interval reaction time showed that the subjects who received vasopressin reacted faster than those who received placebo. When a variable alerting-interval was used, no difference in reaction time was apparent between the vasopressin and placebo-treated groups.

We report that lysine vasopressin failed to enhance memory or learning in human subjects with Alzheimer's disease, while it did improve reaction time. The fixed-interval reaction time test indicates either an enhancement of motor response or attention or both. Our results suggest a nonspecific activating effect of vasopressin. This effect, similar to that expected with other central nervous system stimulants, like amphetamine, may well enhance learning and/or memory in noncognitively impaired individuals. The basal organic impairment of this patient group may account for their failure to respond to vasopressin.

Effects of Phenytoin Withdrawal on Matching to Sample and Workshop Performance of Mentally Retarded Individuals—A Brief Report[1]

Vicky J. Davis, M.A.[2]

Phenytoin is used with about 40% of institutionalized and non-institutionalized mentally retarded individuals and has been the medication of choice for the control of seizures with all types of populations. Despite its widespread use, only recently have studies begun to examine the effects of phenytoin on measures of learning, performance, and adaptive behavior with the mentally retarded. The present investigation was designed to examine the behavioral effects of phenytoin withdrawal on two procedural tasks with institutionalized mentally retarded individuals: a matching to sample (MTS) color discrimination task and a workshop bicycle brake assembly (Bendix RB-2) task.

The subjects were two female (D & L) and one male (E) institutionalized mentally retarded individuals who had each been receiving phenytoin for at least three consecutive years. Criteria for phenytoin withdrawal was the absence of observed seizures during this 3-year period. None of the subjects were receiving any other antiepileptic or neuroleptic medications. Subjects D, L, and E were 27, 23, and 16 years old, respectively. Subject D was receiving 100 mg oral dose of phenytoin, while Subjects L and E were each receiving 300 mg (100 t.i.d.) oral doses at the beginning of the study. Baseline phenytoin/serum levels for D, L, and E were 3.0 μg/ml, 4.1 μg/ml, and 3.5 μg/ml, respectively.

Method

Matching to Sample

The zero delay matching to sample (MTS) procedure involved a simple discrimination procedure using color stimuli. Each subject was seated in front of the intelligence panel where the center response window was illuminated with one of three colors (sample stimulus). Pressing the center window terminated its illumination and simultaneously resulted in the illumination of the two side windows (comparison stimuli). One of the side windows was illuminated with the same color (matching stimulus) as the center window (sample stimulus) and the other was illuminated with a different color (non-matching stimulus). Randomization of color assignments for each window occurred, with each color appearing equally often as sample, matching, and non-matching stimuli.

A matching response resulted in the delivery of one consumable reinforcer, and an 0.5 sec, 1000 hz tone. A non-matching response or no response within 30 sec terminated the side window illuminations for a 10-sec timeout prior to the onset of the next trial (i.e., illumination of the center window). The failure to emit a response within 30 sec was counted as an error. Five sec after reinforcement delivery or 10 sec after an incorrect reponse (error), the center window was illuminated to begin the next trial. Each incorrect response resulted in the stimulus being repeated until a correct response was emitted. The dependent variable was the percentage of correct responses per session. Each subject participated in two or three sessions per week with each session consisting of 30 trials. The first three sessions were pretraining sessions where the matching-to-sample procedure was followed and the subjects were given vocal and physical prompts that were gradually faded out until the subjects were able to respond independently. The fourth session began the experiment proper, in which phenytoin doses were systematically reduced following a multiple-baseline-across-subjects design (Baer, Wolf, & Risley, 1968). Subject D received one dose reduction (100 mg to 0 mg) while Subjects L and E received two reductions (300 mg to 150 mg to 0 mg). The number of daily phenytoin administrations remained consistent as dose reductions oc-

A complete version of this paper appears in the *Journal of Nervous and Mental Disease* (Davis, V.J., Poling, A.D., Wysocki, T., and Breuning, S.E. Effects of phenytoin withdrawal on matching to sample and workshop performance of mentally retarded persons 169(11): 718-729, 1981).

[2] Substance Abuse Clinic, Western Psychiatric Institute and Clinic, University of Pittsburgh School of Medicine, Pittsburgh, PA 15261.

curred, and an inactive placebo was administered once 0 mg was reached.

Workshop

A retrospective analysis of Subjects D and L's performance on a workshop assembly task was performed once the matching to sample sessions were completed. The workshop task involved the assembly of a 15-part coaster bicycle brake assembly (Bendix RB-2) (Gold, 1972, 1973). Each brake was assembled individually by each subject utilizing a 15-compartment tray for sequential assembly. The three response measures recorded were percentage of time on task, number of assemblies completed, and number and type of prompts required from teacher or aides. Interobserver agreement checks by the workshop supervisor were completed on 15% of the teachers' and aides' ratings. The mean percentage of agreement was 89.6% with a range of 79.4% to 98.6% across sessions.

Serum Levels—EEG Assesments

Both phenytoin serum levels (gas liquid chromatography) and electroencephalogram (EEG) assessments were completed prior to baseline (within 5 days of Session 1) and the final reduction (10 to 14 days after matching to sample Sessions 13, 42, and 55 for Subjects D, L, and E; and workshop Sessions 19 and 54 for Subjects D and L, respectively). An additional phenytoin/serum level EEG was completed 4 days after the onset of the 150 mg dose for Subjects L and E (MTS Sessions 22 and 30, respectively, for L and E, and workshop Session 33 for L). Seizure monitoring procedures were in effect throughout the study. Double-blind procedures were implemented throughout; neither ward staff, workshop staff, nor subjects were aware of the phenytoin dose reductions or placebo administrations.

Results

The results of the study empirically demonstrate that doses of phenytoin considerably lower than the suggested optimum therapeutic level of 10-20 μg/ml (Rall & Schleifer, 1980) can impair the performance of mentally retarded individuals on both matching to sample and work assembly tasks. As the doses were reduced for each of the three subjects, there were increases in matching to sample task, with the highest percentage correct being obtained after, and only after, the 0 mg dose was reached. The greatest number of brake assemblies completed and lowest numbers brake assemblies completed and lowest numbers of prompts required in the workshop setting occurred only after the 0 mg dose was reached. There was no substantial change in the percentage of time-on-task for either subject in the workshop setting. Also, there were no EEG changes across withdrawal, and the results correlated with serum level changes.

Conclusion

The findings from this study have serious implications for the mentally retarded who receive phenytoin. While the subjects in the study are perhaps not typical of most epileptics receiving phenytoin, there are a great number of mentally retarded individuals receiving phenytoin of whom they are representative. It is not unreasonable to generalize the present findings to other mentally retarded individuals who are receiving phenytoin and have been seizure free for extended periods of time. For example, recent estimates suggest that about 28% of all the mentally retarded receiving phenytoin have not had observed seizures (Davis, Cullari, & Breuning, in press). This suggests that large numbers of the mentally retarded are experiencing an unnecessary drug-induced impairment in performance. However, it is important to mention that even though none of the subjects showed evidence of a clinical seizure while receiving phenytoin or following withdrawal, this certainly does not indicate that all mentally retarded individuals receiving phenytoin, but remaining seizure free for an extended period of time could be successfully titrated off of the drug. Probably some could not. However, given the possibility of behavior and impairment, conservative use of phenytoin is warranted.

Effects of Neuroleptic Drugs on the Intellectual and Habilitative Behaviors of Mentally Retarded Persons[1]

Donald G. Ferguson, Ph.D.[2]

There has been a paucity of studies examining behavioral alternatives to neuroleptic drug control of inappropriate behaviors with institutionalized mentally retarded persons. Furthermore, only a few of these studies have assessed the effects of these drugs on IQ scores or performance in habilitative programs. The following studies were conducted to determine the effects of neuroleptic drugs in these areas.

Method

A total of 162 mentally retarded persons participated in four studies (i.e., Breuning & Davidson, 1981; Breuning, Davis, Matson, & Ferguson, under review; Breuning, Ferguson, Davidson, & Poling under review; Breuning, O'Neill, & Ferguson, 1980). The 79 males and 83 females ranged in age from 11-71, had IQs between 19 and 64, and were receiving one neuroleptic drug for time periods ranging from 0.1-3.7 years. In Experiments 1 and 2, participants were on thioridazine, chlorpromazine (CPZ), mesoridazine, lithium carbonate, or haloperidol in dosages ranging from 200-1,500 mg daily (CPZ equivalent). In Experiments 3 and 4, participants were receiving only thioridazine in daily mg dosages ranging from 100-800. In all four studies, when drugs were withdrawn, placebo/double-blind procedures were used.

Experiment 1

This experiment compared the effectiveness of neuroleptic drug (D), response-cost (RC), and D + RC procedures for controlling aggressive and psychotic behaviors. Prior to the beginning of this study, all participants received tokens for engaging in a variety of appropriate/adaptive behaviors. When the experiment proper began, the token economy did not include an RC contingency (loss of tokens for engaging in target behaviors). All participants were receiving neuroleptic drugs for behaviors such as physical aggression, property destruction/disruption, and yelling/screaming. The two treatment sequences were: D (base-line), D + RC, and RC for Sequence 1 and D, placebo (P), and RC for Sequence 2. In the first sequence, drugs were withdrawn during the first 3 weeks of the RC condition. In the second sequence they were withdrawn during the first 3 weeks of the P condition. The mean frequencies of inappropriate behaviors during the last week of each condition of Sequence 1 were 50.2, 49.6, and 5.2 for the D, D + RC, and RC conditions, respectively. In Sequence 2, the mean frequencies for the D, D + RC, and RC conditions were 46.3, 51.3, and 3.7.

It is apparent from the data that the behavioral procedure alone was more effective than the drug alone or in combination with the behavioral procedure. Also, the results from Sequence 2 illustrate that the combination of drug and behavioral procedure was not necessary as a transition stage from drug alone to using the behavioral procedure alone. The results of this study suggest that neuroleptic drugs can interfere with responding to external reinforcement contingencies. This issue was examined further in a different situation in Experiment 2.

Experiment 2

In this experiment, the effect of neuroleptic drugs on IQ scores was assessed when residents were tested under standard (i.e., following procedures in test manual) and reinforcement (an edible reinforcement given for each correct response) conditions. IQ tests were administered on three occasions, each separated by 60 days. The participants were divided into four groups and assigned to one of four condition sequences. During the first two test administrations all participants were receiving drugs. Test 1 was given under standard conditions for all groups. Test 2 was given under standard conditions for Groups 1 and 3 and reinforcement conditions for Groups 2 and 4. During the third test, the groups were tested under the same conditions as Test 2. However, Groups 1 and 2 were taken off medication during the first 3 weeks following the second test. Groups 3 and 4 remained on drug.

[2] Developmental Disabilities Program Division, Brainerd State Hospital, Box 349, Brainerd, MN 56401.

While all four groups were on drugs there were no differences in IQ scores, regardless of whether tests were administered under standard or reinforcement conditions. The mean IQ scores for the four groups on the first and second test were 24.8, 27.6, 24.2, 26.3 and 25.7, 24.5, 24.0, and 26.9, respectively. On the third test the mean IQ scores for the four groups were 32.6, 54.7, 24.2, and 25.4, respectively. The two groups tested off drug showed mean increases of 6.9 IQ points (standard conditions) and 30.2 IQ points (reinforcement conditions). But the other two groups tested on drugs showed only slight changes. The results of this study support and extend the findings of Experiment 1.

In the first two studies, all participants had been previously selected for drug discontinuation because they displayed a high frequency of inappropriate behavior while on drug. Therefore it could be argued that the results are specific to those individuals who do not respond to neuroleptic drug treatment. This possibility was examined in a third study.

Experiment 3

There were two equal divisions (20 responders and 20 nonresponders) of participants formed on the basis of data gathered in a prestudy drug trial. The 20 responders were individuals showing decreased frequencies of inappropriate behaviors (at least 60%) while on thioridazine and 20 nonresponders were individuals showing no change (less than 10%) or increased frequencies of inappropriate behaviors while on drug. The prestudy drug trial used an ABA design (on-drug, off-drug, on-drug). Both the responders and nonresponders were each divided into four groups and exposed to the same condition sequences as described for Experiment 2. However, the time periods between test administrations were not equal. Tests 1 and 2 were separated by 8 weeks and Tests 2 and 3 were separated by 12 weeks. Drugs were titrated over a 3-week period from Week 10 to Week 13 of the study.

The frequency of inappropriate behaviors (e.g., physical aggression) were recorded throughout the study. There was little difference in scores for any of the groups on the first two tests. On the third test, Groups 1 and 2 of both the responders and nonresponders had been off drugs for 9 weeks while Groups 3 and 4 remained on drugs. For both responders and nonresponders, the only substantial score changes on Test 3 occurred in the groups tested under the off-drug/reinforcement condition. The mean increase in IQ score for these groups was 26.5 and 24.4 IQ points for responders and nonresponders, respectively. Mean test score changes for all other groups ranged from *−2.9* to *+4.1* points. There was little change in the frequency of inappropriate behaviors while all the groups were receiving thioridazine. However, when the drug was withdrawn from the two groups in each division of responders and nonresponders, the responders showed a significant increase in inappropriate behaviors, and the nonresponders frequencies significantly decreased. There is one disparate finding between Experiment 2 and 3. In the former study, increases in test scores were found under both standard and reinforcement conditions when drugs were withdrawn, while in Experiment 3 significant increases were found only under reinforcement conditions off-drug. The basis for this discrepancy is unclear. However, it is apparent that in both studies reinforcement procedures in the absence of neuroleptic drugs resulted in large increases in IQ scores for both responders and nonresponders.

Experiment 4

The final experiment was designed to assess the effect of thioridazine on the performance of a workshop task (assembly of a 15-part bicycle coaster brake). In addition, the effect of gradual vs. abrupt drug withdrawal and drug initiation was assessed. The study was conducted over a 29-week period. The conditions were abbreviated as follows: D-drug; ND-no drug; A-abrupt; withdrawal (end of Week 10); G-drug discontinued gradually over a 3-week period (Weeks 20-22). The groups were designated D-D, D-NDA, D-NDG, ND-D, and ND-ND where the letters before the hyphen refer to the first 10 weeks of the study and the letters after the hyphen refer to Weeks 11-29. Although three response measures were taken (time-on-task, number of prompts, and number of completions), the clearest drug effects were observed on the last measure and only they will be discussed.

Analyses showed that by the tenth week the two groups not receiving drugs (ND-D and ND-ND) were completing more assemblies than the others. On Weeks 12-15 the two groups not receiving drug (ND-ND, D-NDA performed significantly different than the other groups. Group ND-ND continued to improve while group D-NDA's performance deteriorated. The same was true of group ND-D. Throughout the remainder of the study, group ND-ND performed significantly better than all the other groups. The performance of group D-NDA gradually improved over a period of about 10 weeks and eventually surpassed their performance during the first 10 weeks of the study. Group D-NDG showed a decrease in performance during drug withdrawal, but the level of performance recovered much faster than was observed in group D-NDA. Group ND-D's performance, after an initial decrease, rapidly recovered to a level comparable to that observed during the first 10 weeks. Group D-D's performance remained fairly constant throughout the entire study and in the final weeks of the study was lower than the performance of all the other groups.

Both drug discontinuation and initiation disrupted performance. The most severe and longest lasting deficits were produced by abrupt withdrawal. The group that did not receive drugs at any time during the study (ND-ND) performed superior to all of the other groups.

The results of these four studies taken collectively indicate that neuroleptic drugs administered to institutionalized mentally retarded individuals 1) in many instances do not reduce inappropriate behaviors; 2) interfere with responding to reinforcement contingencies; and 3) interfere with the performance of workshop tasks. These effects are observed in both responders and nonresponders. Given the results of the above studies and other published reports (e.g., Breuning, Ferguson, & Cullari, 1980), it is apparent that the possible deleterious effects of neuroleptic drugs must be carefully assessed before they are administered to mentally retarded individuals. Finally, the results of these studies have possible legal ramifications. It is stated in the *Minimum Constitutional Standards for Adequate Habilitation of the Mentally Retarded* that neuroleptic drugs will not be used "...in quantities that interfere with a residents, habilitative *program*..." The interpretation of these standards with regard to drug responders is complex; since inappropriate behaviors are being effectively controlled there is no problem concerning excessive doses, but it is obvious that even with these individuals drugs interfere with habilitative processes. The case against the use of these drugs with nonresponders is very clear. When there is no evidence of a therapeutic effect and habilitative processes are clearly interfered with, neuroleptic drug use should be considered excessive and unnecessary.

An Applied Dose-Response Curve of Thioridazine with the Mentally Retarded: Aggrssive, Self-Stimulatory, Intellectual, and Workshop Behaviors—A Preliminary Report[1]

Stephen E. Breuning, Ph.D.[2]

Neuroleptic drugs are frequently prescribed for the mentally retarded in an attempt to suppress a plethora of unwanted behaviors. Surveys spanning the past decade have consistently shown that 40-50% of the institutionalized mentally retarded receive such drugs (*see* Breuning & Poling, in press, for a review). Most recently it has been found that similar use of neuroleptic drugs occurs in community foster homes and group homes for the mentally retarded (i.e., Davis, Cullari, & Breuning, in press). In both institutional and community settings thioridazine is by far the most prescribed neuroleptic with this population, as it accounts for 60-70% of all neuroleptic drug prescriptions.

Despite its wide use, little is known about the therapeutic and contratherapeutic effects of thioridazine. In three recent reviews it was concluded that thioridazine *may* be useful in reducing aggression, general motor activity, and self-stimulation with the mentally retarded (Aman, in press; Breuning & Poling, in press; Ferguson & Breuning, in press). However, these reviews also point out that evidence of therapeutic effect is the exception, not the rule, with thioridazine and the mentally retarded. The issue of therapeutic effect is further confounded by data from several recent reports which suggest that even when there is a reduction in symptomatology, there may well be a concomitant reduction or disruption (increased variability) in adaptive/habilitative behaviors (e.g., Breuning & Davidson, 1981; Breuning, O'Neill, & Ferguson, 1980; Singh & Aman, 1981).

While these findings have consistently been replicated in methodologically sound studies, only one study (Singh & Aman, 1981) has attempted to examine thioridazine effects in a dose-dependent manner. It was found that a low dose of thioridazine was as effective as a much larger dose in controlling self-stimulatory behaviors. The present report represents the initial findings of a study designed to further the findings of Singh and Aman (1981) by assessing the dose-response properties of thioridazine with mentally retarded individuals across four response measures, nine dose levels, and a placebo condition.

Method

Subjects

The subjects were 84 non-autistic, institutionalized, mentally retarded individuals between the ages of 13 and 27 and with IQs ranging between 34 and 59. Informed consent was obtained for each subject and there were approximately equal numbers of males and females. In total, there were 14 responders and 14 nonresponders assessed for aggressive behaviors, and 16 responders and 16 nonresponders assessed for self-stimulatory behaviors. For the intellectual and workshop behaviors there were 14-14 and 15-15 responders and nonresponders, respectively. Most of the individuals being assessed for the aggressive or self-stimulatory behaviors were also individuals receiving either the intellectual or workshop tasks. There were no individuals assessed on both adaptive measures, and those assessed for aggressive behaviors were not emiting self-stimulatory behaviors and vice versa.

Procedure

Each dose and placebo condition lasted for 8 weeks with half of each group (e.g., 7 of 14 responders) receiving conditions in an ascending order and half in a descending order (8-7 or 7-8 for workshop). Because of the clinical nature of the study, these subject assignments were not prepared randomly. Rather, half of the subjects had reached the highest dose as part of clinical treatment and were now withdrawn. The remaining half were determined clinically appropriate for initiation of neuroleptic treatment because of the above-mentioned symptomatology. Double-blind conditions were in effect throughout, as neither

---

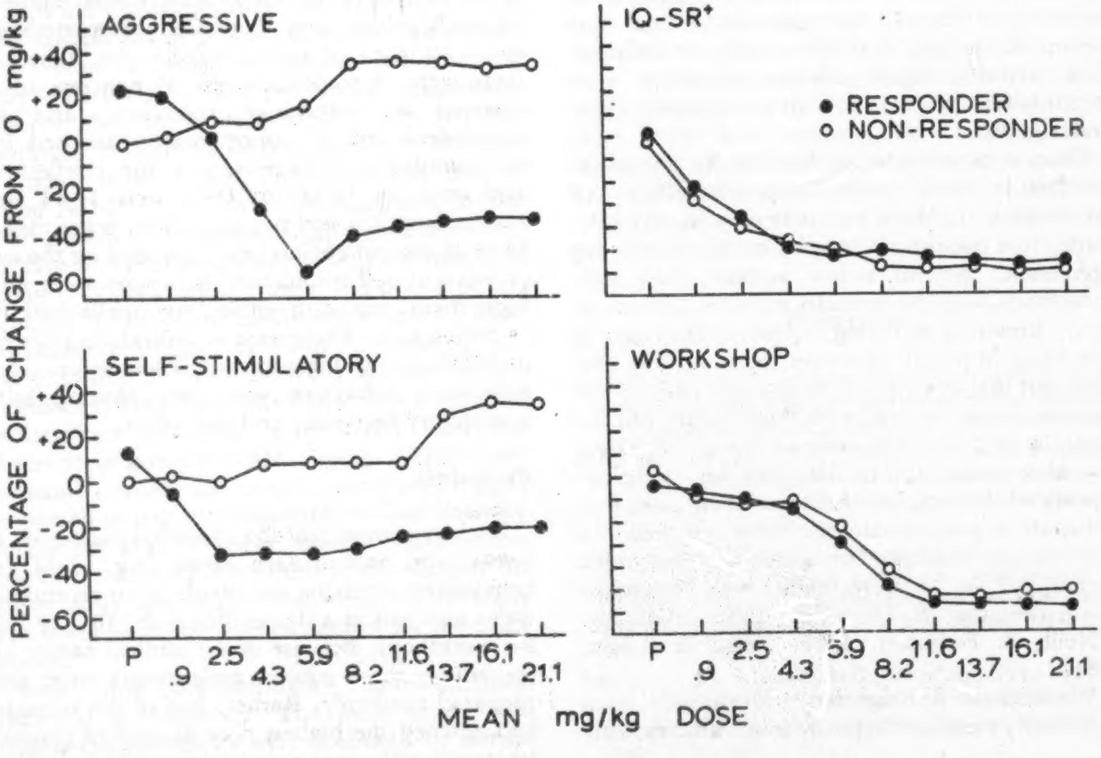
[2] Department of Psychiatry, Western Psychiatric Institute and Clinic, University of Pittsburgh School of Medicine, Pittsburgh, PA 15261.

staff nor subjects were aware of conditions or dose. There were two equal dose administrations daily.

Definitions of aggression and self-stimulation were in observable and measurable terms and recorded by staff in 30-minute intervals, 24 hours per day (*see* Breuning, O'Neill, & Ferguson, 1980). Reliability checks were made by independent observers on a random selection of four 30-minute intervals per day. Mean reliability was 87.4% with a range of 76.3% to 92.4% across days. Intellectual behaviors were assessed using the procedure described by Breuning and Davidson (1981). Briefly, subjects received intellectual testing (Stanford-Binet, Form LM) under conditions where correct responses were reinforced with edible reinforcers selected on an individual basis. Workshop behaviors were assessed using procedures described by Davis, Poling, Wysocki, and Breuning (1981). In short, the number of 15-part coaster bicycle brakes (Bendix RB-2) assembled on an individual basis were counted. Completion of 0-7 of the 15 parts counted as 0 completion, 8-14 of the parts as one-half completion, and 15 parts as one completion.

Results and Discussion

The Figure shows the results from each response measure separately for responders and nonresponders. Data were analyzed using split-plot analyses of variance (one per response measure) with repeated measures and *post hoc* comparisons following Tukey's honestly significant difference (HSD) method (*see* Kirk, 1968).



FIGURE

Percentage of change from the off-drug condition (0 mg) plotted separately for responders and nonresponders and each response measure across the placebo condition (P) and nine doses.

Data in the Figure are plotted as percentage of change from the off-drug condition (0 mg) across the placebo (P) condition and nine doses. Data for the aggressive and self-stimulatory behaviors reflect daily frequencies; intellectual behaviors (IQ-SR+) reflect intelligence test scores; and workshop behaviors reflect the number of parts completed per session. Dose levels are plotted as means with no subject having more than a + or − 4% deviation from the mean.

For the responders, a dose of 5.9 mg/kg/day was optimal for reducing aggressive behaviors and a dose of 2.5 mg/kg/day was optimal for reducing self-stimulatory behaviors ($p < .01$). Higher doses had little additional effect except for a loss of behavioral control; i.e., increased frequencies of target behaviors ($p < .01$). For the nonresponders, the frequencies of aggressive and self-stimulatory behaviors showed no substantial changes at the lower doses ($p > .05$) but began to worsen as thioridazine doses increased ($p < .01$). For both responders and nonresponders, there were significant decreases in intellectual and workshop behaviors at even low doses ($p < .01$) and a continued worsening as the dose was increased ($p < .01$). Performance in the IQ-SR+ task was substantially more sensitive to dose changes than with the workshop task. For all response measures and both responders and nonresponders, identical dose effects were obtained regardless of ascending or descending order of conditions ($p > .05$).

The results from this study are clear. Mentally retarded individuals showing a beneficial response to thioridazine treatment (responders) will likely have the greatest suppression of aggressive behaviors occur at a moderate dose (about 6.0 mg/kg/day) and the greatest suppression of self-stimulatory behaviors occur at a fairly low dose (about 2.5 mg/kg/day). Regardless, it is also likely that there will be a concomitant decrease in adaptive/habilitative behaviors. For nonresponders, there may not only be a failure to show suppressed inappropriate behaviors but also a worsening of these behaviors (behavioral toxicity) along with a decrease in adaptive/habilitative behaviors.

There are two additional points worth making. First, preliminary correlational and discriminant function analyses show no significant relationship between psychiatric diagnosis or other possible predictor variables and whether or not an individual was a responder or nonresponder. Second, the equal numbers of responders and nonresponders in this study should not be interpreted to mean that 50% of the mentally retarded receiving neuroleptics will be responders. The reviews cited earlier suggest that only 10-15% of the mentally retarded receiving a neuroleptic will show a beneficial response.

An Analysis of Institutionalized Retarded Residents Using DIS-CO[1]

Robert L. Sprague, Ph.D.[2]

It is likely that tardive dyskinesia is as common among institutionalized populations of mentallyretarded peoples, due to extensive use of neuroleptic drugs (Davis, Cullari, & Breuning, in press; Sprague, 1977), as it is in psychiatric populations of patients. No systematic assessment using standardized instruments of such a population has been conducted, although surveys have been made (Baldessarini, 1979; Paulson, Rizvi, & Crane, 1975). In addition to the usual complications that persistent tardive dyskinesia causes any person, recent research has shown that even mild to moderate dyskinesia can interfere with performance on sheltered workshop tasks in which a large percentage of retarded residents participate as a therapeutic program (Breuning, Davis, Matson, & Ferguson, in press). When the fact that a serious side effect also actively interferes with ongoing programs is brought to the attention of a court, the court usually issues orders restricting use of such drugs (Sprague, in press).

Considering these two issues solely, the time for a systematic investigation of tardive dyskinesia in institutionalized populations of mentally retarded residents is long overdue. With these aims in mind, a project was undertaken to systematically assess the populations of two state-operated institutions for the mentally retarded in the midwest. In one institution it was possible to assess each resident, but in the other institution numerous problems such as budget cuts reducing staff and resignations prevented assessing the entire population. Consequently, emphasis is given in this report to the first institution in which the entire population of 519 residents participated in the study with less emphasis on the second facility where 67 residents were studied for a total of 586 residents.

A survey of the literature on rating scales of dyskinesia revealed that only one instrument, the Abnormal Involuntary Movement Scale (AIMS), had some reliability and validity data (Smith, Kucharski, Eblen, et al. 1979; Smith, Kucharski, Oswald, & Waterman, 1979), but it was felt that the items were of such a global nature that one might not be able to distinguish between tardive dyskinesia and the numerous movement disorders due to neurological disease, brain damage, and long-term social isolation, problems which can be readily found in institutionalized populations. Thus, a new scale was developed which contained 34 items subdivided into 10 body areas. Because the scale is too long to publish in this journal, copies are available from the author. Preliminary pilot studies were conducted on the wording of items which were changed to be readily understandable to nurses and licensed practical nurses. The scale was given the name Dyskinesia Identification System-Coldwater (DIS-CO).

After intensive inservice training and pilot ratings on some residents, nurses at one institution were asked to personally examine and rate every resident in the institution. Where possible, i.e., two nurses familiar with the residents in a ward, two independent assessments of the same residents were made to obtain interrater reliability correlations. Also, when possible, two different assessments about 1 month apart by the same nurse for the same resident were made to obtain stability correlations.

Each item was rated on a five-point scale: not present - 0, minimal - 1, mild - 2, moderate - 3, and severe - 4 with NA (not assessed) used when it was not possible to rate that particular item.

In the Table are listed the means and standard deviations for each of the 10 body areas with the number of items per body area in parentheses, the reliability correlation between two independent raters, and the stability correlations over about a 1-month period of time. Totals for each body area were summed over the number of items for that area to obtain the data included in the Table. In a similar fashion, the overall total was obtained. The overall mean rating was 8.8 (possible range 0 to 132) with a standard deviation of 6.8. All of the reliability and stability correlations are highly significantly different from zero.

It should be obvious that this reported data represents only the first step of a project if tardive dyskinesia is to be accurately and reliably assessed repeatedly in retarded populations and its relationship to neuroleptic drug administration determined. The DIS-CO instrument will be refined on the basis of this data; the refined instrument related to 4 years of drug history now available on the residents and, finally, a withdrawal of neuroleptic drugs study is underway to ascertain the effects of withdrawal on the ratings of abnormal movement as shown by this scale. Clearly, much remains to be done, but the issues are crucial to the welfare of mentally retarded people.

Acknowledgment: The author wishes to thank his colleagues Stephen E. Breuning, Vicky J. Davis, Donald Ferguson, John E. Kalachnik, and Rina Ullmann for their help in this study.

Tardive Dyskinesia in Mentally Retarded Children, Adolescents, and Young Adults: North Carolina and Michigan Studies

C. Thomas Gualtieri, M.D.,[1] Stephen E. Breuning, Ph.D.,[2] Steven R. Schroeder, Ph.D.,[2] and Dana Quade, Ph.D.[2]

Although neuroleptic drugs are frequently prescribed for behavior control and alleviation of psychiatric symptoms in mentally retarded children, adolescents, and young adults (Lipman, DiMascio, Reatig, & Kirson, 1978; Davis, Cullari, & Breuning, 1982), no systematic or methodologically acceptable studies of the occurrence of tardive dyskinesia (TD) in mentally retarded patients have appeared in the literature (Gualtieri & Hawk, 1980). Two parallel studies of TD and other problems associated with neuroleptic withdrawal were conducted: the North Carolina study (Gualtieri and Schroeder) was primarily concerned with clinical factors associated with TD; the Michigan study (Breuning) was primarily concerned with the course of TD symptoms after neuroleptic withdrawal.

Method

Subjects

Subjects were referred by treating physicians who felt that a trial neuroleptic withdrawal should be a routine part of each patient's clinical management. Inclusion criteria were: a) IQ less than 75, functional diagnosis of mental retardation (American Association of Mental Deficiency criteria); b) stable living environment; c) appropriate educational or workshop placement; d) good general health, with no active neurologic disease, or history of neurologic disorder which might be associated with dyskinesia; and e) continuous neuroleptic treatment of at least 6 months' duration.

North Carolina Study. Thirty-eight subjects (age 5 to 47, mean = 19.4 ± 1.7 [SEM]) were studied at four clinical sites: a psychiatric hospital, a pediatric psychopharmacology clinic, and two residential facilities for the mentally retarded. The mean age at which subjects began neuroleptic treatment was 10.9 (± 1.0) years. The mean duration of treatment was 8.3 (± 6) years, and total lifetime exposure to neuroleptics, expressed in chlorpromazine (CPZ) equivalents (Davis, 1976) ranged from 13.5 to 11,188 grams (mean = 1,046.7 ± 344.3).

Michigan Study. Fifty-seven subjects were studied at the Coldwater Regional Center. Subjects in the Michigan study were older than the North Carolina group ($p < .02$), had higher IQ scores ($p < .001$), and were treated with higher neuroleptic doses immediately prior to withdrawal ($p < .001$) (*see* Table). Because so many subjects in the Michigan group had been treated with neuroleptics for substantial periods of time as outpatients, comprehensive neuroleptic drug histories are not available for this group. All subjects, however, had been treated continuously with neuroleptics for at least 1.3 years prior to entry into this study.

Procedure

Subjects received comprehensive neurologic and developmental assessments prior to neuroleptic withdrawal. Special attention was given to neurologic or developmental problems (e.g., cerebral palsy, autism) which might be associated with dyskinetic movements, stereotypies, or psychotic mannerisms which may have anteceded neuroleptic treatment. After baseline evaluation, subjects were withdrawn from neuroleptic drugs, with serial examinations for dyskinesia, behavior change, or nondyskinetic withdrawal symptoms.

North Carolina Study. Subjects were assessed at weekly or biweekly intervals at baseline, during and after withdrawal, and until 8 weeks after complete discontinuance of neuroleptics. The Abnormal Involuntary Movement Scale (AIMS) exam and rating scale were used (Guy, 1976). Subjects who continued to manifest dyskinesia at 8 weeks were subsequently reexamined at monthly intervals. Mean interrater reliability among three physician raters on the AIMS rating scale was 0.83 (0.74-1.00) (Cohen's Kappa).

Michigan Study. Dyskinetic movements were assessed at weekly intervals at baseline, during withdrawal, and for 80 weeks thereafter. The Withdrawal Emergent Symptom Checklist (WESC) rating scale and examination were used (Engelhardt, 1974), and interrater reliability was 0.79 (Cohen's Kappa).

Results

Four outcome categories were considered according to diagnostic criteria that have been described elsewhere (Gualtieri, Sprague, Breuning, & Campbell, 1981): 1) no problems associated with neuroleptic withdrawal; 2) transient withdrawal problems, that is, withdrawal dyskinesia, nondyskinetic withdrawal symptoms, or acute behavior deterioration; beginning during neuroleptic withdrawal or immediately thereafter, and lasting less than 16 weeks after complete withdrawal; 3) mild TD; and 4) moderate or severe TD. In spite of the clinical differences between the two groups, the outcome of both studies are remarkably similar (*see* Table).

One-third of the total group ($N = 95$) experienced no problems prior to, during, or for at least 8 weeks after neuroleptic withdrawal; one-third experienced only transient withdrawal-related problems; and one-third had TD. Most of the cases of TD were characterized by moderate or severe movements. Of 31 cases of TD, only 7 were apparent while patients were on maintenance doses of neuroleptics. Six of the 7 cases of maintenance onset TD were characterized by dyskinesia that was rated as moderate or severe.

Thioridazine (THD) was the neuroleptic most commonly prescribed in both locations (58% of subjects). There was no association between the use of THD or any other particular neuroleptic and the development of TD.

North Carolina Study

The following were considered in a stepwise regression analysis of variables which might be associated with the development of moderate to severe tardive dyskinesia: location, age, race, sex, age at which neuroleptic treatment was begun, IQ, duration of treatment, total lifetime neuroleptic exposure, mean daily dose, and use of THD as the primary neuroleptic. The single variable that was most highly correlated with the development of moderate or severe TD was total lifetime exposure (analyzed as log of the total lifetime dose, $R^2 = 0.38$ for a one-variable regression). The regression analysis selected three independent variables, total lifetime exposure (log dose), IQ, and the age at which neuroleptic treatment began that were most highly correlated with moderate or severe TD ($R^2 = 0.65$, $F = 18.82$, 3 and 31 *df*), and each independent variable contributed significantly to the regression. Since treatment duration was highly correlated with total lifetime exposure ($r = +0.69$) adding it to the analysis did not increase R^2. None of the other variables contributed significantly to the equation. Nonparametric correlations (Goodman-Kruskal) also showed total lifetime exposure to be the variable most highly correlated with TD ($G = .531 \pm .120$, $p < .0001$).

Michigan Study

Dyskinetic movements were maximal at 4 weeks after neuroleptic withdrawal, when 36 of 57 patients (63%) exhibited symptoms. Dyskinetic movements were noted in 30 patients (53%) at 16 weeks, and in 18 patients (32%) at 52 and 80 weeks. This remission pattern was similar for movements of the tongue, lips and face, and head, limbs, and trunk. Facial dyskinesias which were rated as mild at 4 weeks were more likely to remit, and those which were rated as moderate or severe at 4 weeks were more likely to persist at 80 weeks (chi-square analysis, $p \leq .05$ and $\leq .025$, respectively). Dyskinetic movements which were apparent prior to neuroleptic withdrawal were invariably persistent.

Discussion

Moderate to severe, persistent TD is a cause for concern and a serious problem in mentally retarded children, adolescents, and young adults treated with neuroleptic drugs, a finding that must stand in sharp contrast to the dearth of empirical data to support the clinical use of neuroleptics in this group. The occurrence of TD is, not surprisingly, related to the patient's total lifetime exposure to neuroleptics. Dyskinetic movements that "break through," i.e., that are manifest on maintenance neuroleptic doses, predict a particularly severe and persistent course. However, the large majority of cases of TD — even severe and persistent TD — may not be apparent while patients continue to receive neuroleptic drugs. One may surmise, then, that epidemiologic surveys of TD that do not include trial neuroleptic withdrawal periods will necessarily underestimate the frequency of TD. On the other hand, a substantial number of the dyskinetic movements which arise within 4 weeks of neuroleptic withdrawal will remit spontaneously; such cases are better classified as "withdrawal dyskinesias."

Clearly, although advanced age may increase the risk of TD (Smith & Baldessarini, 1980), youth, at least in combination with mental retardation, does not confer protection from TD. In light of this serious risk, it is noteworthy that very few of the patients in these two samples actually needed to be on neuroleptic medication. In the North Carolina group, only 11 of 38 patients had to return to neuroleptic treatment; in the Michigan group, none returned. When behavior problems following neuroleptic withdrawal did arise, they were usually time limited, or readily controlled using behavioral or programmatic approaches. Many of these behavior problems appeared to be concentrated in the immediate postwithdrawal period, suggesting that a period of behavioral instability occurs following withdrawal. Physicians who withdrew mentally retarded patients from neuroleptic drugs should not take this postwithdrawal behavior deterioration as a mandate to immediately resume treatment with neuroleptics.

Neuroleptic Serum Levels in Mentally Retarded Boys

James C. Harris, M.D.,[1] Larry E. Tune, M.D.,[1] Michael Kurtz, M.D.[2] and Joseph T. Coyle, M.D.[1]

This is a preliminary report on the measurement of serum neuroleptic levels in mentally retarded children and adolescents. The investigators have measured neuroleptic levels in 60 patients on a variety of neuroleptics (haloperidol, chlorpromazine, trifluoperazine, molindone, thioridazine). However, a summary of neuroleptic blood levels in 9-15 year-old boys taking thioridazine for behavior management is the subject of this report.

Until recently there had been no simple procedure for the measurement of neuroleptic serum activity levels. However, a radioreceptor assay described by Snyder and Creese (1977) based on competition of neuroleptics in plasma or serum for the binding of [^{3}H]-spiroperidol to dopamine receptors may serve this function. The assay measures dopamine receptor blockade and, therefore, detects active metabolites as well as parent drug activity. This is a distinct advantage for thioridazine which has several active metabolites.

Previous reports by Tune, Creese, Depaulo, Slavney, Coyle, and Snyder (1980) and Cohen, Lipinski, Pope, Harris, and Altesman (1980) have demonstrated a correlation between serum levels of neuroleptics and therapeutic response in acutely psychotic patients during an acute episode. Both studies showed poor correlations between oral dosage and serum level.

Myers, Tune, and Coyle (1980) have used this assay to manage schizophrenia in childhood at Johns Hopkins. The current investigators are now studying the use of the radioreceptor assay in the retarded where both thioridazine and haloperidol are approved for use in the management of behavior disorders.

Method

Sixteen moderately to severely retarded 9-15 year-old boys taking thioridazine as a single treatment participated in the study. All are residents in a well-staffed and well-supervised behaviorally oriented institutional setting and are considered to be patients who are the most difficult to manage. Each subject had been on the same dosage of medication for at least 2 weeks.

Five milliliters of blood were drawn from each member of the study population 2 hours after supervised oral administration of the medication to obtain peak blood levels. Specimens were cooled and allowed to clot over a 2-hour period, centrifuged, and the serum frozen at 70° C in glass tubes. Assays were performed in triplicate.

On the day before the blood specimen was obtained, the Sprague Resident Behavior Checklist was completed by the case manager.

Results

The serum drug levels were looked at as total dosage and as mg/kg/day. Drug levels were recorded as haloperidol equivalents (ng/ml). In each instance, when a resident was on a given daily dosage of drug there was variability in blood level at that dosage. Thus, for the four residents on a total daily dosage of 50 mg, levels ranged from 13-102 ng/ml haloperidol equivalents and for the four residents on 75 mg/day the range was from 37-199 ng/ml haloperidol equivalents. In two residents on 100 mg/day, the range was from 65-122 ng/ml haloperidol equivalents. So, on a given dose there was up to an eightfold variation in drug level.

If the dosage is looked at as mg/kg of thioridazine, when the dosage reached 2.0 mg/kg considerable variability in level was evident. For example, at a dosage range of 2.0-2.3 mg/kg the level varied from 20-199 ng/ml haloperidol equivalents, a tenfold difference in level. The four residents on higher dosages from 3.2-14.8 mg/kg had levels over 95 ng/ml haloperidol equivalents.

The Sprague Resident Behavior Rating Scale was completed on each resident. No specific correlations were demonstrated between drug level and total score or individual scores on specific behavioral items. Since intense aggression and assaultive behavior is a common indication for drug treatment, global ratings of aggression were reviewed carefully. There was no correlation between drug level and severity of aggressive behavior, although the most physically aggressive boys were on the highest dosages of neuroleptics, 4.8 and 8.8 mg/kg, respectively.

Conclusions

In this group of retarded boys we have demonstrated variability in the neuroleptic level of thioridazine 2 hours after oral administration, as was previously reported in adults by Tune et al. (1980) and Cohen et al. (1980). Further work will need to be done to demonstrate the usefulness of the assay in patient management and to determine whether there is a threshhold neuroleptic level in the management of target symptoms in the retarded, especially in aggressive behavior. However, current findings may be pertinent to the possible relationship of high neuroleptic levels and long-term complications such as dyskinesias and for thioridazine, retinopathy.

The assay may provide a useful tool for future monitoring of drug therapy in the retarded and be of use in the treatment of medication nonresponders.

Efficacy of Mianserin in Mildly Depressed Patients

Jonathan W. Stewart, M.D.,[1] Frederic M. Quitkin, M.D.,[1] Patrick J. McGrath, M.D.,[1] Michael R. Liebowitz, M.D.,[1] and Donald F. Klein, M.D.,[1]

Mianserin is a tetracyclic antidepressant with demonstrated efficacy (Brogden, Heel, Speight, & Avery, 1978). Since mianserin appears to have a different mechanism of action from the tricyclic antidepressants (TCAs)(Brogden et al., 1978), it seemed useful to investigate the efficacy of mianserin in patients with relatively mild depression, a population similar to that previously studied using desipramine (DMI) (Stewart, Quitkin, Liebowitz, et al., 1981.)

The study design was identical to that previously utilized for DMI (Stewart et al., 1981). Basically, patients aged 18-65 with Hamilton Depression Scores (HAM-D) less than 19 who met Research Diagnostic Criteria (RDC) (Spitzer, Endicott, & Robbins, 1978) for depression were placed on placebo for 10 days single-blind. Patients who responded were removed from further study. Those who maintained their level of depression were randomized to double-blind treatment with mianserin or placebo for 6 weeks. At reevaluation after 10 days of placebo and after 6 weeks' double-blind treatment, response was defined as a Clinical Global Impression (CGI) score of 1 or 2 ("very much improved" or "much improved"). Nonresponse was a CGI score of 3 or higher ("minimally improved," "unchanged," or "worse").

Initial mianserin dose was 30 mg/d, increased twice weekly to 150 mg/d unless side effects prevented such regular increases. Previous studies had used 60-90 mg/d as a maximal dose of mianserin (Coppen, Ghose, et al., 1977; Wheatley, 1977). As this dose of mianserin had been compared with 150 mg/d of amitriptyline, it was felt that a higher dose of mianserin might be more comparable to 300 mg of a TCA. In addition, a pilot study (McGrath, Quitkin, Stewart, et al., 1981) had suggested additional benefit as dose was raised to 150 mg/d. Hence, the latter was selected as a maximal dose to attempt to maximize likelihood of response. Statistical analysis included the chi-square test without Yates correction to 2 × 2 tables using two-tailed tests.

The mean age of 127 patients entering the study was 43 ± 12 (range, 21-65). There were 72 men and 55 women. Twenty-seven patients dropped out and 17 responded during the initial 10 days of placebo. Of the 83 patients completing the randomization trial, 54% (21/39) responded to mianserin, 27% (12/44) to placebo ($X^2=6.64$, $p<.02$). According to RDC diagnoses, patients with definite diagnosis for major depressive disorder demonstrated a 50% (10/20) response to mianserin, 14% (3/22) to placebo, a statistically significant difference ($X^2=6.48$, $p<.02$). Patients with intermittent depressive disorder did not demonstrate this difference, 64% (7/11) responding to mianserin, 40% (4/10) to placebo

---

[1] New York State Psychiatric Institute, New York, NY 10032.

($X^2 = 1.17$, n.s.). There were not enough patients with minor depressive disorder ($N = 6$) to test for significance.

Differential response among RDC major depressives was entirely accounted for by those with endogenous subtype. Thus, patients with endogenous subtype had a 77% (10/13) response to mianserin, 9% (1/11) to placebo ($X^2 = 11.50$, $p < .001$). By contrast, major depressives without endogenous depression had an 18% (2/11) response to mianserin, 31% (5/16) to placebo ($X^2 = 0.58$, n.s.). Major depressives with endogenous depression were significantly more likely to respond to mianserin than major depressives without endogenous subtype ($X^2 = 8.22$, $p < .01$).

Most of the subtypes of major depressive disorder which had appreciable numbers demonstrated at least a trend for significant drug-placebo response differences. In each case, however, this difference seemed entirely accounted for by those who also had endogenous subtype. For example, among major depressives with simple subtype, 50% (9/18) improved on mianserin, 14% (3/21) on placebo ($X^2 = 5.80$, $p < .02$). However, patients with simple subtype who also had endogenous subtype had an 82% (9/11) response rate to mianserin, 9% (1/11) to placebo ($X^2 = 11.73$, $p < .001$). Patients with simple subtype who did not meet criteria for endogenous had a 0% (0/7) response to mianserin, 20% (2/10) response to placebo ($X^2 = 1.59$, n.s.). Response to mianserin was significantly more likely among the simple subtype if they were also endogenous than if not ($X^2 = 11.45$, $p < .001$).

Among patients with situational subtype of major depression, 30% (6/20) improved on placebo. While this was not significantly greater than placebo response of major depressives without situational subtype (13%, 1/8, $X^2 = 0.9$, n.s.), this had been the group in the previous study (Stewart et al., 1981) which demonstrated increased response. Combining placebo responses from the two studies yielded a significantly increased placebo response among major depressives with situational subtype when compared to those without situational subtype ($X^2 = 7.13$, $p < .05$, $df = 2$).

Regardless of diagnosis, differential response occurred among patients with more severe illness. That is, patients at or above the median Day 10 HAM-D score of 13 had a 60% (12/20) response to mianserin, 27% (7/27) to placebo ($X^2 = 5.54$, $p < .02$). Patients with Day 10 HAM-D score below 13 had a 47% (9/19) response to mianserin, 29% (5/17) to placebo ($X^2 = 1.22$, n.s.).

These results demonstrate the efficacy of mianserin in this population of mild- to moderately depressed outpatients. In particular, patients with endogenous subtype of major depressive disorder seemed to account for the mianserin-placebo response difference found. Major depressives without endogenous subtype may do poorly on mianserin. No group was found to have increased placebo response. These differential responses according to RDC subtype partially validate this system as being useful for the treatment of affective illness.

Differential response according to presence or absence of endogenous subtype suggests that RDC major depression defines a heterogeneous population, some of whom improve due to specific mianserin effects, some who are unresponsive to this medication, and a few of whom improve due to nonspecific factors. For both research and clinical purposes, RDC major depression with endogenous subtype may define a fairly homogeneous population in which to use mianserin.

Although placebo response of major depressives with situational subtype was not significantly greater than those without situational subtype, combining these results with those from the previous study (Stewart et al., 1981) did suggest increased placebo response among situational depressives. This again suggests that some patients with clear-cut psychosocial precipitants may improve without the need for medication.

While many of these results were similar to those found previously with DMI, mianserin may not have the same spectrum of action as DMI. In the present study, 65% (7/11) of patients with intermittent depressive disorder responded to mianserin. While this was not significantly greater than the placebo response in this group, it does compare favorably with the 13% (1/8) response rate of this group to DMI in the earlier study. Since placebo response in this group was little different in the two studies (4/11 vs. 2/8), this suggests that mianserin might be beneficial for some intermittent depressives, while DMI is not.

As in the DMI study (Stewart et al., 1981) it

TABLE

Response by Diagnosis and Severity of Illness

Research Diagnostic Criteria**	% Response to Mianserin	% Response to Placebo	χ^2	Significance
Major Depressive Disorder	50 (12/24)*	23 (7/31)	4.50	$p<.05$
with endogenous subtype	77 (10/13)[a]	13 (2/15)	11.50	$p<.001$
without endogenous subtype	18 (2/11)[a]	31 (5/16)	0.58	n.s.

Within Mianserin Contrasts:

a = Major Depressive Disorder with Endogenous Subtype vs. without Endogeneus Subtype, $\chi^2 = 8.22$, $p<.01$.

b = Major Depressive Disorder Simple Subtype with Endogenous Subtype vs. without Endogenous Subtype, $\chi^2 = 11.45$, $p<.001$.

Within Placebo Contrasts:

c = Major Depressive Disorder with Situational Subtype vs. without Situational Subtype, $\chi^2 = 0.93$, n.s.

was patients above the median of pre-randomization HAM-D scores who demonstrated specific medication response. This was true, however, only for Day 10 HAM-D, not for initial HAM-D (results not shown). Thus, patients who maintain their depression at a certain level for 10 days may be good candidates for either mianserin or DMI. Conversely, few patients with Day 10 HAM-D below 13 may be expected not to respond to either DMI or mianserin. Such patients may require other antidepressants, such as monoamine oxidase inhibitors, or psychotherapy in order to improve.

The Effect of Mianserin on Cardiac Conduction: A Controlled Study

Patrick J. McGrath, M.D.,[1] Frederic M. Quitkin, M.D.,[1] David Blood, M.D.,[2] Michael R. Liebowitz, M.D.,[1] Jonathan W. Stewart, M.D.,[1] Abby Fyer, M.D.,[1] and Donald F. Klein, M.D.[1]

A variety of studies have shown that tricyclic antidepressants (TCAs) can affect the heart and particularly cardiac conduction at toxic dosages. The typical electrocardiographic (ECG) changes seen include tachycardia, prolongation of the PR interval, and widening of the QRS complex (Bigger, Kantor, Glassman, & Perel, 1978). These are associated with a variety of arrhythmias. The PR prolongation is thought to represent inhibition of conduction in the ventricular specialized conducting system, especially in the Bundle of His (Vohra, Burrow, Hunt, & Sloman, 1978). There is less clarity about how much effect the TCAs have on cardiac conduction when used at therapeutic dosage in the normal heart. In patients with preexisting conduction defects, there appears to be general agreement in the literature that the TCAs can aggravate these disturbances and cause significant cardiac toxicity (Kantor, Bigger, Glassman, et al. 1975). One of the features of interest of newer antidepressant compounds is the possibility of less cardiac toxicity. This is clinically important both because of the contribution this makes to the drugs' lethality in overdose as well as drug safety in patients with heart disease.

This investigation was undertaken to explore the cardiac effects of mianserin, a tetracyclic antidepressant. Crome and Newman (1977) reported a series of cases of poisoning with either maprotiline (Ludiomil) or mianserin (Bolvidon). In 20 cases of mianserin overdose, no arrhythmias similar to those seen in TCA overdose were observed. Kopera and Schenk (1977) monitored the clinical ECG of 54 patients who had preexisting "gravely disturbed" ECGs who were treated with 30 to 60 mg daily of mianserin. These studies suggested that mianserin had little or no cardiac toxicity.

Method

Depressed patients between the ages of 18 and 65 with no significant medical illness were recruited from ongoing studies at the New York State Psychiatric Institute. All 48 patients had normal routine clinical ECGs. Each patient had a high-speed, high-fidelity ECG done while drug free. A second high-speed ECG was done after each patient was stabilized on drug or placebo treatment. These were recorded after 4 to 6 weeks of treatment after at least 1 week on the maximum dose of medication they received during the drug trial. Electrocardiograms were interpreted by an experienced cardiologist (D.B.) who was blind to treatment status of the patients. Statistical analysis was done using analysis of covariance with baseline scores as the covariate. Treatments were then compared by *t*-test.

Results

The mean daily drug dosages (mg/day) were 142 ± 16.9 for mianserin, 222 ± 71.2 for amitriptyline (AMI), and 225 ± 65.5 for imipramine (IMI)(*see* Table). Both AMI and IMI produced a significant increase in heart rate over baseline compared to placebo, while mianserin did not. The PR interval during drug treatment was significantly prolonged compared to placebo IMI but not for AMI, although there was a trend for the latter. Mianserin treatment did not

Table

Corrected ECG Variables by Treatment Compared to Placebo (Pre/Post Treatment Score)

	Placebo ($N = 12$)	Mianserin ($N = 19$)	Amitriptyline ($N = 9$)	Imipramine ($N = 8$)
Heart Rate (Beats/min)	70.9/72.5 -	77.8/79.8 N.S.	68.0/89.7 $p = .0003$	71.3/89.4 $p = .002$
PR Interval (msec)	148.3/144.4 -	147.8/149.5 N.S.	154.9/150.8 $p = .08$	145.3/161.9 $p = .0007$
QRS Interval (msec)	90.9/92.8 -	89.8/87.2 N.S.	83.7/91.7 $p = .04$	89.9/99.3 $p = .11$
QT Interval (msec)	418.3/427.0 -	427.8/430.3 N.S.	408.2/435.4 $p = .04$	431.2/445.9 $p = .06$

significantly change the PR interval. There was a trend for IMI to prolong the QRS interval, while mianserin and AMI did not. Prolongation of the QT_c interval was seen with AMI and IMI but not with mianserin treatment.

Conclusion

In a sample of medically healthy depressed patients with normal pretreatment ECGs treated with mianserin, no changes in cardiac conduction could be detected using high-speed, high-resolution ECG, compared to patients randomly assigned to placebo. Patients treated with IMI or AMI showed significant increase in heart rate as well as prolongation of the PR and QT_c intervals. The conduction changes, though clearly significant, would not have been demonstrated using routine clinical ECGs. The investigators conclude that mianserin, even when used in a dosage which is higher than has previously been employed clinically, shows little effect on cardiac conduction. If this is confirmed in further studies, trials of mianserin in depressed patients with disease of the cardiac conducting system would be warranted. If shown to be as effective an antidepressant as the tricyclics, it may be a drug of choice for patients with cardiovascular disease. Additionally, the method of high-speed ECG was suggested as being a sensitive screening technique to get evidence of the effects of new drugs on cardiac conduction in patients. This can be studied easily and evidence of the drug's effect shown, even though there are no clinically significant changes in the routine clinical ECG.

Double-Blind Comparison of Bupropion vs. Amitriptyline in Depressed Out-patients

Nancy Harto-Truax, B.S.,[1] Judith Van Wyck Fleet, B.A.,[1] and Warren C. Stern, Ph.D.[1]

Bupropion HCl (Wellbutrin®) is a novel antidepressant with a structure shown in Figure 1. Potential antidepressant properties of bupropion were first suggested by its antagonism of tetrabenazine-induced ptosis and sedation in the mouse (Soroko, Mehta, Maxwell, et al. 1977). Bupropion's neurochemical and pharmacological profile is distinct from that of tricyclic and monoamine oxidase (MAO) inhibitor antidepressants. Bupropion has minimal effects on blocking neuronal reuptake of norepinephrine or serotonin, and does not inhibit MAO (Ferris, Maxwell, Cooper, & Soroko, 1981). Although bupropion weakly inhibits the reuptake of dopamine (Ferris et al., 1981), the neurochemical mode of the antidepressant action of bupropion must still be elucidated. In animals, bupropion does not possess anticholinergic, antihistaminergic, antiserotonergic, or cardiotoxic properties (Soroko et al., 1977; Wang, Parker, & Maxwell, 1981).

The antidepressant properties of bupropion were previously demonstrated in two double-blind, placebo-controlled inpatient trials (Stern & Harto-Truax, 1980). Bupropion produced significantly greater improvement than placebo starting at 8 days in one study (using doses of 300-750 mg/d) and at 3 weeks in the other study (doses of 300-450 mg/d). The side-effect profile of bupropion in both studies was similar to that of placebo with a notable absence of anticholinergic, cardiotoxic, or sedating side effects. In view of these initial efficacy findings and a low side-effect profile, it was appropriate to further assess the efficacy and safety of bupropion relative to a tricylic antidepressant.

In the present interim report, the antidepressant activity and safety of bupropion were compared to that of amitriptyline in a six-center out-

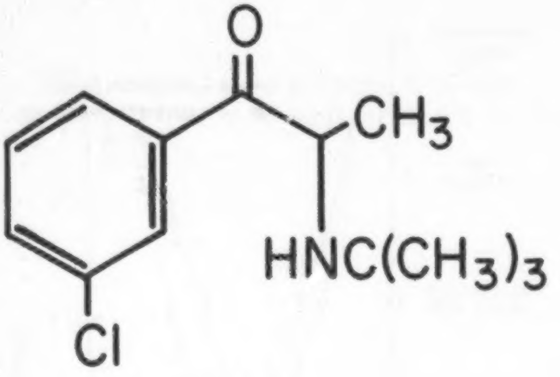

FIGURE 1. Structure of bupropion.

patient investigation (*see* Acknowledgments). A double-blind, randomized, parallel treatment design study with a 2:1 ratio of bupropion ($N=$ 81) to amitriptyline ($N=$ 42) treated patients was conducted. Treatment was scheduled for up to 15 weeks, the first week consisting of a single-blind placebo period. Responders to placebo during the initial week, as judged by an improvement of more than 10 points on the Hamilton Depression Scale or a Hamilton Depression rating of less than 18 on Day 7, were dropped from the study. Patients were then treated for up to 13 weeks with an ascending dosage regimen of either bupropion (300-450 mg/d, administered t.i.d.) or amitriptyline (75-150 mg/d, administered q.h.s.). The final week of the study consisted of a drug-free, posttreatment, followup period to assess possible withdrawal effects.

Entrance criteria required that each patient satisfy the diagnostic criteria for major affective disorder as defined by the FDA guidelines (1977); be 18-65 years old; have a current depressive episode duration of 4 weeks to 2 years; have a minimum Hamilton Depression total score of 18; have at least a moderate rating on the Clinical Global Severity Scale; have acceptable baseline values on vital signs, EKG, physical, and clinical laboratory examinations; and be withdrawn from other psychoactive medication. Patients who had a history or evidence of a seizure disorder, intestinal obstruction, glaucoma, significant cardiovascular disease, or thyroid dysfunction; alcoholism, alcohol abuse, or drug abuse within the past 2 years; or intolerance to amitriptyline were excluded from the study. Patients who were currently suicidal; schizophrenic or schizoaffective; receiving guanethidine or an other agent whose effects are known to be blocked or enhanced by tricyclic antidepressants; or who were pregnant, lactating, or did not agree to employ contraception to avoid pregnancy during the study were also excluded.

Comparison of the bupropion and amitriptyline groups with respect to demographic characteristics indicated that the majority of the patients were females (70% and 62%, respectively), and caucasian (94% and 98%). The average age was 39.7 years for the bupropion group and 36.0 years for the amitriptyline group. Of the 98 patients included in the efficacy analyses, the majority were diagnosed as either manic-depressive, depressed (70%), or with depressive neurosis (23%) according to the Diagnostic and Statistical Manual-II (American Psychiatric Association, 1968). None of the patients had received prior hospitalization for a depressive episode, and the mean duration for the current episode of depression was 6.0 and 7.2 months for the bupropion and amitriptyline patients, respectively.

The efficacy of bupropion was compared to amitriptyline using the Clinical Global Severity of Illness and Improvement Scales (Figure 2), and the Hamilton Depression and Anxiety Scales (Figure 3). Both bupropion and amitriptyline patients showed a significant ($p < 0.05$) improvement from baseline in their severity of illness and Hamilton Depression scores starting on Day 7 of active drug treatment (Study Day 14). Significant improvement from baseline in the Hamilton Anxiety scores occurred starting on Day 14 of bupropion treatment and Day 7 of amitriptyline treatment. For both treatment groups, all subsequent assessments on each scale differed significantly from baseline. Similar equivalency of results were obtained with the Zung Self-Rating Depression and Anxiety Scales. Except for Treatment Day 7 (Study Day 14) on the Hamilton Depression Scale, there were no significant differences in efficacy at any of the nine assessment points for each rating scale between the bupropion and amitriptyline groups. At termination of treatment, 85% of the bupropion and 81% of the amitriptyline patients were rated much or very much improved on the Clinical Global Improvement Scale.

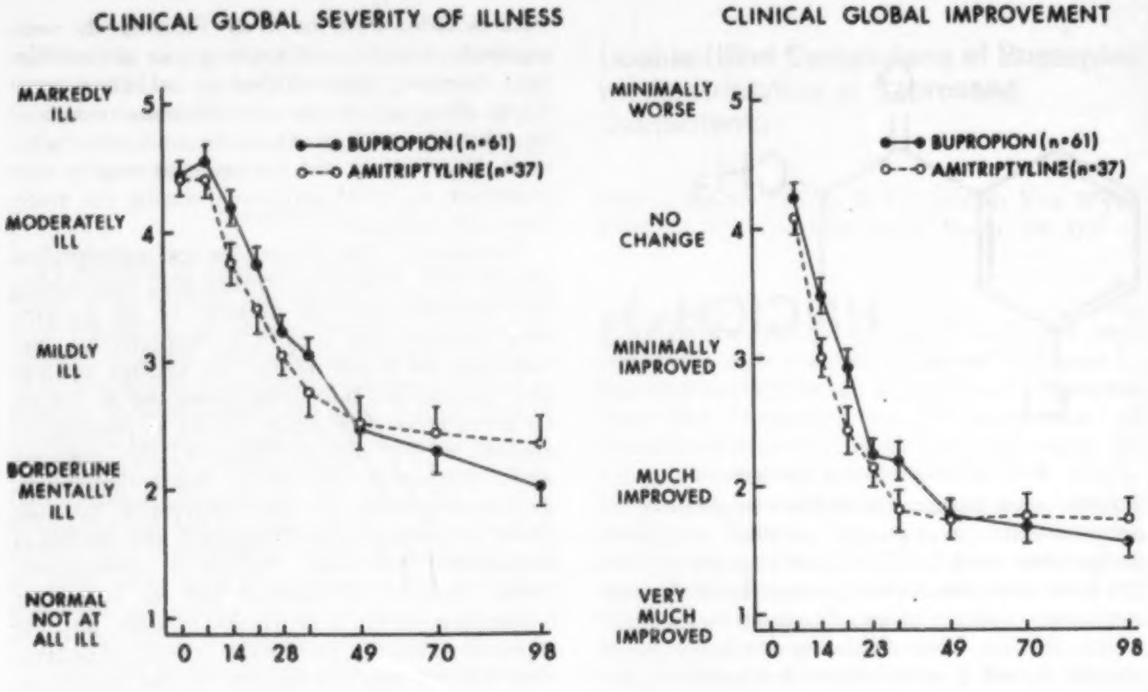

FIGURE 2. Comparison of bupropion vs. amitriptyline on the Clinical Global Severity of Illness and Improvement Scales. (Improvement is judged relative to baseline.)

With respect to safety, bupropion treatment was associated with fewer drug-related side effects than amitriptyline treatment. Side effects were recorded at each assessment day using a modified Treatment Emergent Symptom Scale format (Guy, 1976). Two of the 81 bupropion patients were discontinued due to adverse events (rash) as was one of the 42 amitriptyline patients (disturbed concentration, confusion, and agitation). During treatment, there were five adverse experiences whose relative frequencies, both in terms of percent patient and report incidence, were differentially associated with either amitriptyline or bupropion. Blurred vision, dry mouth, dizziness, and nightmares occurred more often in amitriptyline patients (in 11-27% more patients); whereas, only decreased appetite occurred more frequently in bupropion patients (in 15% more patients). During the posttreatment week, no withdrawal effects were noted in either group. Analyses of mean change in body weights between baseline and termination of treatment showed a mild weight loss (2.1 pounds) by bupropion patients in contrast to a mild weight gain (2.4 pounds) by amitriptyline patients. With respect to vital signs, bupropion treatment resulted in no clinically significant cardiovascular changes, whereas amitriptyline produced significant ($p < 0.05$) increases in supine and standing pulse rates (5 and 6 beats/min, respectively), and a number of reports of orthostatic hypotension.

In conclusion, during a six-center, double-blind outpatient investigation, bupropion (300-450 mg/d) produced antidepressant activity comparable to amitriptyline (75-150 mg/d) with both groups showing significant improvements in their depression scores after 7 days of treatment. Bupropion treatment was associated with fewer drug-related side effects, particularly fewer sedative, anticholinergic, and cardiovascular-related adverse events than those observed with amitriptyline.

Wellbatrin Studies

Baron Shopsin, M.D.,[1] and Gregor Laakmann, M.D.[2]

Among the 30 or more newer "second generation" antidepressant molecules reviewed by us in recent years, bupropion is one of the few discovered in the United States and one of the more unique in profile of clinical activity (Shopsin, Cassano, & Conti, 1981).

Bupropion HCl (Wellbatrin) is an antidepressant of the propiophenone class, with a structure shown in the Figure. Demonstrating an antidepressant potential in animals in the learned helplessness and tetrabenazine models, its neurochemical profile remains distinct from other standard/marketed antidepressants of the tricyclic-monoamine oxidase (MAO) inhibitor classes. Included in the pharmacological profile of bupropion is an absence of anticholinergic, antihistaminergic, and antiserotonergic properties. At the time of writing, its central chemical mode of antidepressant action awaits clarification (Maxwell, Mehta, Tucker, et al. 1981; Stern, Harto-Truax, Rogers, & Miller, 1981).

This paper is an abstract of data presented at the 1981 NCDEU meeting which focused on three separate studies: a single-blind comparison of Wellbatrin vs. imipramine in depressed outpatients; long-term maintenance or prophylactic effects in both unipolar as well as bipolar manic-depressives; and neuroendocrine studies carried out to help clarify its potential mechanism of action.

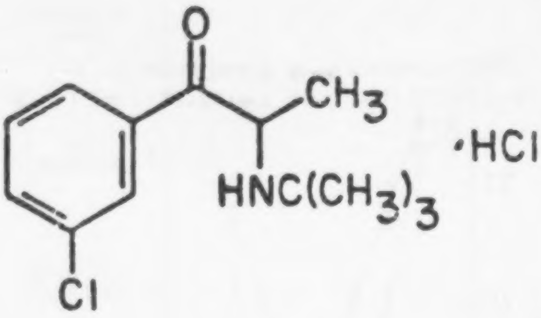

FIGURE. Bupropion HCl (Wellbatrin™)

Wellbatrin-Imipramine Study

The efficacy and safety of three Wellbatrin regimens (150 mg/d, 300-450 mg/d, and 300-900 mg/d) and one imipramine regimen (up to 300 mg/d) were compared in a single-blind, randomized, parallel trial with 40 depressed outpatients. The study was carried out at the Affective Disorder-Lithium Clinic, NYU-Bellevue Hospital Center under conditions of written informed consent. The number of patients examined was limited (10 patients in each drug group), so that conclusions from a biometric standpoint must be circumspect. Within these methodological constraints, it may be concluded that:

1) Both high-dose Wellbatrin and imipramine showed a comparable and statistically significant antidepressant action in endogenously depressed outpatients. These findings were documented using a battery of standard National Institute of Mental Health-Pharmacologic and Somatic Treatments Research Branch (NIMH-PST) objective rating devices including patient self-rating scales. Most patients in the low and mid-dose range groups required switching to high dose medication (i.e., 300-900 mg/d range) after 2 weeks.
2) The speed/onset of action was similar for both compounds and reached statistical significance by the end of the second week.

---

[1] New York University School of Medicine, New York, NY 10016,
[2] Psychiatrische Klinik und Poliklinik, Universität München, West Germany.

3) Wellbatrin was well tolerated. There were virtually no side effects recorded for these drug groups irrespective of dosage. There were no anticholinergic side effects; the drug was nonsoporific and did not cause fatigue or drowsiness. Imipromine was accompanied by a high incidence of anticholinergic and central nervous system effects.
4) Vital signs and laboratory tests remained essentially unchanged for both drugs.

Prophylactic Trials

Those patients responding to Wellbatrin, who also had a documented history of illness recurrence at least once yearly during the 2 years immediately prior to Wellbatrin treatment, were continued in an open trial for 1 year. All unipolar and bipolar patients remaining on medication showed no illness relapse and were able to sustain a reduction in dosage and an absence of any side effects (Shopsin, Cassano, & Conti, 1981).

None of the unipolar or bipolar patients showed a swing to mania and none needed the addition of lithium carbonate to prevent or stabilize any such behavioral toxicity.

Three bipolar patients who had never before responded to antidepressant drugs without a swing into a manic state, also did well for a 1-year period on Wellbatrin alone. All three cases were known to us in the clinic for many years. Prior psychoactive treatment responses of these patients were either poor or unsustained, and lithium was unable to prevent or satisfactorily attenuate continued recurrences of high or low mood states. This, then, was the first occasion that any of the three bipolar patients showed any prophylactic response for a 1-year period. There were no attendant side effects.

All patients, unipolar as well as bipolar, relapsed into depression (all unipolar and two bipolar) or mania (one bipolar) within 6 months of discontinuing Wellbatrin; all patients were placed on other medication when Wellbatrin was discontinued because of their history of recurrences, except for the bipolar patient who became manic.

Neuroendocrine Studies

The effect of bupropion on the secretion of growth hormone (GH) and prolactin (PRL) was studied in six healthy male subjects and another six male hyperprolactinemic patients, using a randomized double-blind paradigm. The collaborative study was carried out in Germany at the Outpatient Pscyhiatric Clinic, University of Munich. The six "normal" subjects and six psychiatric patients each received placebo (one dose) and 200 mg bupropion (one oral dose) under conditions of written informed consent. The patient group was pretreated with a neuroleptic drug, haloperidol. The studies with both healthy volunteers and psychiatric patients occurred at an interval of 1 week. After administration of the test substances (i.e., either placebo or bupropion), blood was drawn to measure GH or PRL up to 240 minutes (i.e., 4 hours) thereafter. The data presented clearly indicate that bupropion, in the dose administered, leads to no change in the secretion of GH or PRL in humans. The findings hold both in the normal volunteers and with psychiatric patients pretreated with haloperidol (i.e., rendered hyperprolactinemic). There was no change in the thyroid-releasing hormone (TRH)-induced stimulation of PRL in either the normal volunteers or psychiatric patients (Laakmann, Hoffmann, & Hofschuster, in press).

Conclusion

The present single-blind study data support open trails and double-blind comparisons to the effect that Wellbatrin is an effective antidepressant drug whose clinical response in psychiatric patients is not accompanied by anticholinergic or CNS effects. (Stern, Harto-Truax, Rogers, & Miller, in press). It appears particularly suited for patients with psychomotor retardation. Preliminary data in both unipolar as well as bipolar patients suggest a prophylactic effect for bupropion against acute recurrences of either mania or depression. Finally, in efforts to clarify its potential mechanism of action, we carried out neuroendocrine studies to examine the potential effects of bupropion on central noradrenergic and dopaminergic mechanisms. Our negative findings fail to enhance our understanding of the possible mechanism of action of this new and exciting antidepressant drug.

Atypical Depressives: A Prelminary Report of Antidepressant Response and Sleep Patterns

Frederic M. Quitkin, M.D.,[1] David Schwartz, Ph.D.,[1] Michael R. Liebowitz, M.D.,[1] Jonathan R. Stewart, M.D.,[1] Patrick J. McGrath, M.D.,[1] Frieda Halpern, M.A.,[1] Joaquim Puig-Antich, M.D.,[1] Elaine Tricamo, R.N.,[1] Edward J. Sachar, M.D.,[1] and Donald F. Klein, M.D.[1]

Although tricyclic treatment for severe depressive disorder was adopted as a standard by 1970, there was still no agreement on the best method of treating the large number of mildy or moderately depressed patients seen in outpatient settings.

In an effort to render antidepressant drug treatment more uniformly effective, investigators began to reconsider two aspects of the problem: refinement of diagnostic classification and alternative treatment strategies. Accumulating evidence now suggests that meaningful subtypes may differentially respond to alternative treatment. It was in this context that we have formulated the present investigation.

Subtypes of Depressive Disorder

It has been recognized that some depressed patients, especially among outpatients and those failing to respond to standard tricyclic treatment, show symptoms opposite to the traditional endogenous constellation. These nonendogenous symptoms include overeating and weight gain, initial insomnia without intermittent or early morning awakenings, and mood worsening in the evening. In addition, such patients are responsive to their social surroundings and can be temporarily cheered, although their dysphoric mood returns. This symptomatic picture is referred to as atypical depression (Klein, Gittelman-Klein, Quitkin, & Rifkin, 1980). We wished to test the hypothesis that atypical depressives are more likely to respond to monoamine oxidase inhibitors (MAOI) than tricyclic antidepressants.

Sleep polysomnography has been demonstrated to be altered in some depressive subgroups (Kupfer & Foster, 1978). To further understand the atypical syndrome, sleep studies of this patient group were initiated. All of this work is in the preliminary phase. Data from a treatment study and sleep polysomnography are presented.

Method

This is a 7-week drug study of atypical depressives comparing placebo, a tricyclic antidepressant (imipramine), and a MAO inhibitor (phenelzine). All patients received placebo single-blind for 10 days. Patients who were much improved during the initial placebo phase were removed from the study. Treatment and evaluation of progress after the initial placebo phase was done in a double-blind manner.

Subjects

To be eligible, subjects must meet the Research Diagnostic Criteria for major, minor, or intermittent depression (Spitzer, Endicott, & Robins, 1978). To be diagnosed as having an atypical depressive disorder, subjects must have the essential feature of reactivity of mood. They must also be rated as moderate to severe for at least two of four associated features, which include hypersomnia, overeating, fatigue and lethargy, and rejec-

---

tion sensitivity. Subjects are excluded if they meet Research Diagnostic Criteria for schizophrenia, schizoaffective disorder, unspecified functional psychoses, or criteria for endogenomorphic depression (Klein et al., 1980). Patients are excluded if they have been treated in the current episode with tricyclics (greater than 150 mg of imipramine/d or its equivalent) or MAOI (45 mg/d or more of phenelzine or its equivalent).

Medication

Each patient receives two bottles of medication. One bottle contains 15 mg phenelzine or matching placebo, and the other contains 50 mg imipramine or matching placebo. The patient will take the phenelzine or its matching placebo in the morning and the imipramine or its matching placebo at bedtime In no case will the patient receive both active medications. Thus, the dosage schedule is fixed up to 4 tablets/day of each medicine or its placebo. This schedule will be delayed, stopped,or reversed in the event of adverse reactions. The patients who have had a complete remission of symptoms will not have their dose increased beyond 4 tablets/day of each medicine or its placebo. However, for patients who have not responded, every attempt will be made to increase the dose to five or six pills of each medication (that is 75-90 mg phenelzine or 250-300 mg imipramine for patients on an active medication).

Results

This is a preliminary report of an ongoing study. To date, 44 patients have been entered into the study. During the initial 10-day single-blind placebo period, 6 were judged significantly improved and removed from the study; 12 patients were randomized to imipramine, 2 were judged significantly improved, 9 were unimproved, and 1 patient dropped out. Twelve patients were randomized to phenelzine, 7 were judged significantly improved, 3 were judged unimproved, and 2 patients dropped out. Thirteen patients were randomized to placebo, 3 were judged significantly improved, and 10 were judged not improved. This data is summarized in the Table.

Table

Sleep Indexes of Atypical Depressives: A Preliminary Examination

Recent work suggests that the EEG sleep indexes of primary depressives differentiate them from other patients as well as normal controls.

Also reported is a preliminary examination of a pilot study of 10 nonbipolar, atypical depressives studied in our sleep laboratory. Data from Williams, Karacan, and Hursch (1974) as well as that from Kupfer, Foster, Coble, McPartland, and Ulrich (1978) were used to serve as a standard for comparing the sleep indexes of the atypical depressive. The use of data recorded in other laboratories for this purpose is viewed as a methodological shortcoming to be corrected in future studies.

The mean age of the 10 patients with atypical depression is 30.6. Their REMP latency on Night 1 is 69.61 min, SD 31.07; on Night 2, 53.05 min, SD 21.96; and on Night 3, 57.87 min, SD 39.60. Williams et al. (1974) reported normative data in the 30-40 age group, where the REMP latency is 82 minutes, SD 24.77. Kupfer et al. (1978) reported that the REMP latency for 47 patients (mean age 45.7 ± 1.9) with primary depression was 38.6, SEM 3.2 and for 47 patients with secondary depression (mean age 45.7 ± 1.9) it was 72.3, SEM 4.3. This would suggest that patients with atypical depression are different from "normals" and that their REMP latency may differentiate them from secondary as well as primary endogenous depressives.

We also examined other sleep measures in this study of atypical depressives. Total sleep time for atypical depressives was close to 400 min (range is 395-406 min on three nights). This is similar to Williams' et al. normals of 423 min and appears to be different from Kupfer's findings of approximately 304 to 336 min in primary and secondary depressives, respectively.

Summary and Conclusions

These preliminary results support the hypothesis that patients referred to as atypical depressives have a greater likelihood of responding to MAOI than to TCA or placebo. If this preliminary trend persists, it would have important clinical and heuristic implications.

It would suggest that MAOI is the treatment of choice for this patient group. Differential responsivity of MAOI supports the validity of the phenomenologic depressive subtype and suggests that the pathophysiology of this patient subgroup differs from endogenous depressives. It would also be relevant to determine if this response of atypical depressives is specific for hydrazine derivatives such as phenelzine, or whether it also occurs with nonhydrazine derivatives such as tranylcypromine, or specific MAOI such as deprenyl or clorgyline.

The shortened REM latency of atypical depressives suggests that they do share some of the characteristics of other depressive disorders. It might be concluded that this is a mild form of depressive illness. If that were the case, they should respond to TCA as well as MAOI. Since that does not appear to be the case, we think this may be a form of affective disorder whose treatment response and pathophysiology is distinctly different from patients with endogenous forms of the illness.

Biological and Clinical Studies of Tardive Dyskinesia

Robert C. Smith, M.D., Ph.D.,[1] Richard Allen, D.P.H.,[1] Jack Gordon, M.D.,[1] Chandra Misra, Ph.D.,[1] Joseph Schoolar, M.D., Ph.D.,[1] Judith Wolff, R.N.,[1] and Beng T. Ho, Ph.D.[1]

A series of surveys, small treatment trials, and biological studies have been conducted on patients with tardive dyskinesia (TD). In all studies, TD was rated using the Smith-TRIMS TD scale which evaluates multiple symptom areas of dyskinetic and extra pyramidal type symptoms.

A prevalence study of TD was done in eight hospitals in the state of Texas using an age-stratified random sampling procedure (about 50% of the sample below and 50% above the age of 50). Most patients with at least minimal symptoms of TD on initial rating were evaluated for more definite dyskinesia with TD ratings on at least two occasions. On a selected sample of patients, a blood sample was drawn to measure plasma neuroleptics, measured by radio-receptor (RR) assay techniques, during an additional TD rating. For the diagnosis of a positive case of TD, a subject had to have a total TD score of at least 5 on the Smith-TRIMS TD scale on two occasions.

Using these rating procedures and criteria, 35.8% of patients in the sample had definite TD, with the rate about twice as high in patients over the age of 50 (47.1% positive cases) as in cases under the age of 50 (22% positive cases). The percent of patients with definite TD increased in a montonic fashion between the ages of 50 and 60 or 70 but did not increase further in the oldest age groups (Figure 1). Females had higher dyskinesia scores than males in the younger and middle age groups, but did not show a consistent trend for higher TD scores in patients above 60 or 70 years of age.

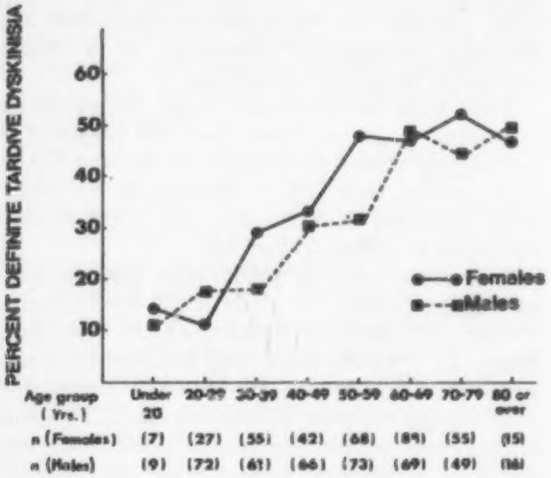

FIGURE 1. Effects of age and sex on the prevalence of tardive dyskinesia

Table

Lower Neuroleptic Plasma Levels in Patients with Definite Tardive Dyskinesia

	Mean Neuroleptic Plasma Level* (RR Assay)		
	Definite TD	No TD	TD Percent Decrease
All Patients	263 ± 35** (101)†	438 ± 98 (52)	−40%
Patients over 50 years	248 ± 42 (65)	450 ± 157 (22)	−45%
Patients 50 years or under	293 ± 65 (36)	430 ± 127 (30)	−32%

* Radio-receptor assay ng/ml chlorpromazine equivalence
**Each number is mean ± s.e.m.
† Number of patients

Radio-receptor plasma levels of neuroleptic drugs that the patients were receiving correlated significantly but negatively with TD scores. Patients who met criteria for a positive case of TD had about 40% lower plasma neuroleptic levels than patients without TD (*see* Table). A similar trend was found in patients under the age of 50 than in patients over the age of 50.

In a small sample of patients treated with lecithin (35 gm/d of 53% phosphatidylcholine) in a double-blind crossover design, lecithin did not have consistent or statistically significant effect in ameliorating TD severity scores; one or two patients showed improvement and one or two patients had a worsening of TD symptoms (Figure 2).

Patients with TD had significantly higher plasma pseudocholinesterase levels than controls (Figure 3), but they showed no significant difference in platelet monoamine oxidase compared to schizophrenic controls.

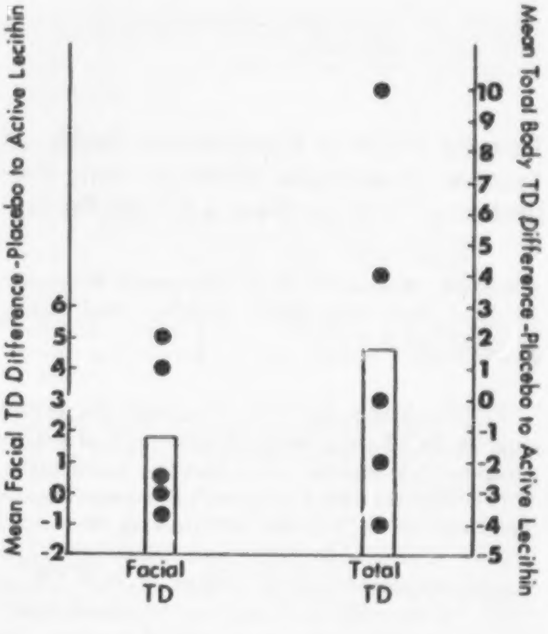

FIGURE 2. Effects of lecithin on tardive dyskinesia. Each point represents the mean difference of placebo minus lecithin scores; a higher score indicates improvement.

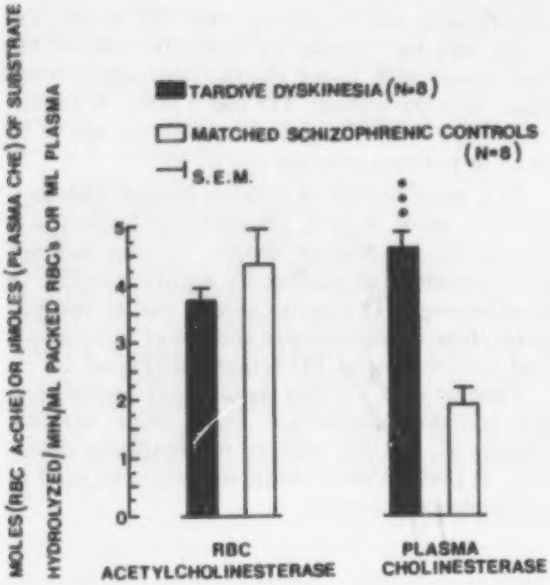

FIGURE 3. Plasma pseudocholinesterase values in patients with TD and control.

Results From a Prospective Study of Tardive Dyskinesia Development: Preliminary Findings Over a 2-Year Period[1]

John M. Kane, M.D.,[2] Margaret Woerner, Ph.D.,[2] Paul Weinhold, Ph.D.,[2] and James Wegner, M.A.[2]

Tardive dyskinesia (TD) remains a major concern in the pharmacological treatment of schizophrenia (American Psychiatric Association, 1979). The lack of a proven, safe, and effective treatment for TD makes attempts at prevention urgent. A review by Kane and Smith (1981) revealed prevalence rates ranging from 0.5% to 56% (mean = 20.1%) among 56 neuroleptic-treated samples. Among untreated samples, the prevalence of abnormal movements ranged from 0 to 36.7% (mean = 5.1%). Since these samples may have differed on many variables other than neuroleptic exposure, contrasting them is not ideal. Despite this, the epidemiological data implicating neuroleptic treatment as a major etiological factor are compelling.

Even with the enormous range in prevalence estimates, it seems clear that the majority of neuroleptic-treated patients do not develop TD. It is important, therefore, to identify factors which might increase vulnerability and then develop strategies to minimize the risk.

This report presents preliminary findings from an ongoing prospective study of TD development. To date, 777 psychiatric patients have entered the study; the majority have been followed for 1 to 3 years. Patients are examined every 3 months and rated on the Simpson Dyskinesia Scale, Simpson Angus Scale (for extrapyramidal side effects), and the Brief Psychiatric Rating Scale. Electroencephalograms and psychometric testing are done at baseline, and detailed histories of psychotropic medications are obtained. Ratings are made blind to treatment history.

Patients who develop "questionable" signs (defined globally) are seen monthly. Diagnosis of presumptive TD requires ratings of at least mild TD by three raters following separate examinations. TD cases are videotaped, discontinued from antipsychotic drugs if possible, and rated biweekly for at least 3 months.

The demographic characteristics of the first 328 patients who were at risk (neuroleptic-treated) include: mean age = 27 (*SD* 9); 59% male; 59% schizophrenic, 17% affective disorder, 12% schizoaffective on the Diagnostic and Statistical Manual-II (DSM-II). The majority had less than 1 year total cumulative neuroleptic exposure prior to study entry (mean exposure 21 months, median 10 months).

To date, 44 cases of presumptive TD have developed during the study. Their characteristics include: 50% male; mean age = 33 (*SD* 12); mean cumulative neuroleptic exposure 30 months (*SD* 31); 34% schizophrenic; 36% major affective disorder; 20% schizoaffective. These patients were classified according to the Research Diagnoses for Tardive Dyskinesia (RD-TD) (Schooler & Kane, 1981) as follows: 30 persistent TD (18 neuroleptic-free and 12 with concurrent neuroleptics);

[2] Long Island Jewish-Hillside Medical Center, P.O. Box 38, Glen Oaks, NY 11004.

8 transient TD, 3 probable, and 3 withdrawal TD.

A life-table analysis employing the first 328 at risk subjects indicated a cumulative incidence of TD of 12% (95% confidence interval 6%-18%) at the end of 4 years of total cumulative neuroleptic exposure. Our effective sample size beyond 4 years is still too small to determine incidence beyond this point.

The patients who developed TD had a mean cumulative neuroleptic exposure prior to TD diagnosis of 158 weeks (*SD* 134) compared with 122 weeks (*SD* 122) for those without TD when last examined (two-tailed p value = .12).

Additional analyses of risk factors eliminated those who had shown any "questionable" signs of TD to provide a sharper distinction between those who developed TD and those who remained "clear" up to the most recent observation. In addition, to explore factors which might indicate those most vulnerable to TD development (Kane, Struve, Weinhold, & Woerner, 1980), TD cases were divided into two groups: those developing TD after less than 2 years of neuroleptic exposure (early TD) and those developing TD after more than 2 years (late TD).

The results indicated that TD cases had longer exposure to neuroleptic and antiparkinsonian drugs prior to study entry than did patients without TD. TD cases compared with non-TD patients were older at study entry, had had a longer psychiatric history, and had more often been treated with electroconvulsive therapy (ECT). Early and late TD cases did not differ significantly on these variables. Early TD cases had significantly lower maximum doses of neuroleptics than late TD cases, suggesting that early TD onset is not related to the use of higher doses of medication. The TD group as a whole, however, did receive significantly higher maximum doses than the non-TD group. Late TD cases had had more neuroleptic-free intervals of at least 1 month and were more likely to have taken combined neuroleptics than both the early TD and clear groups. However, the effects of the latter three variables may be mediated by length of neuroleptic treatment with which they are correlated.

Interestingly, the history of extrapyramidal side effects and the number of months of exposure to lithium prior to study entry were significantly related to the "early" onset of TD. The former has been suggested as a risk factor in the literature (Crane, 1972) and will be explored in more detail in subsequent analyses. The lithium finding may reflect a possible increased risk among patients with affective illness (Rosenberg, Niven, & Hanson, 1977; Davis, Berger, & Hollister, 1976) or may involve unknown long-term neurochemical effects of lithium.

The ECT finding also suggests that diagnosis may be a factor. We found no relationship between DSM II-diagnosis and TD development; however, further exploration using Research Diagnostic Criteria (RDC) diagnoses for matched TD and non-TD cases may prove more fruitful.

Other variables showing no relationship to TD development were: sex, psychometric test scores, history of CNS injury or dysfunction, medication at study entry, potency of predominant neuroleptic, total exposure to tricyclic antidepressants, monoamine oxidase inhibitors, minor tranquilizers, and anticonvulsants.

It is important to emphasize the preliminary nature of these findings. Many risk factors are intercorrelated, and a larger number of TD cases will be necessary in order to carry out more meaningful analyses.

Impairment of Swallowing, Tardive Dyskinesia, and Anticholinergic Drug Use

Thomas J. Craig, M.D., M.P.H.,[1,2] Mary Ann Richardson, M.A.,[1] Nigel M. Bark, M.D.,[1,3] and Roman Klebanov, M.D.[4]

The influence of psychotropic medication on the swallowing mechanism has been a source of controversy since the mid-1950s when case reports of choking deaths among medicated psychiatric patients began to appear (Feldman, 1957; Hollister, 1957; Plachta, 1965; Wardell, 1957). A recent case-control study of choking deaths revealed that patients who choked to death were twice as likely to be receiving two or more drugs with significant anticholinergic effects than matched controls (Craig, 1980). An unpublished report (Moore & Book, 1970) claimed that 40% of an unselected sample of psychiatric patients were found to have an impairment of the gag reflex in contrast to only 9% of "normals." Case studies of two patients with tardive dyskinesia indicated a difficulty in swallowing (Brandon, McClelland, & Protheroe, 1971; Gilbert, 1969.) These findings plus experimental evidence (Bieger, Giles, & Hockman, 1977) implicating dopaminergic mechanisms in the pharyngeal phase of swallowing led to the present study.

Method

The present study was conducted using a nonrandom sample of long-term psychiatric patients in a large state hospital. All but one patient were diagnosed schizophrenic by the treating clinician using Diagnostic and Statistical Manual-II criteria. A research scientist with extensive experience carried out ratings of tardive dyskinesia using the Abnormal Involuntary Movement Scale (AIMS) (Guy, 1976), and the Simpson Abbreviated Rating Scale (ADS) (Simpson, Lee, & Zouback, 1979), and of parkinson-like symptoms using the Neurological Rating Scale (NRS) (Simpson & Angus, 1970). The scoring of the NRS and the ADS were adapted to conform with the AIMS ratings of 0 = absent, 1 = minimal or questionable, 2 = mild, 3 = moderate, and 4 = severe. Separate from this examination but within the same time period, two research psychiatrists independently assessed each patient's gag reflex. The technique and ratings described were developed after a study of the literature and consultation with local experts in neurology and otorhinolaryngology plus a pilot test in patients not included in the study. Inter-rater agreement for this gag reflex rating was acceptably high (Kappa = 0.76, $Z = 7.05$). After both clinical procedures were completed on all patients, a history of current medication usage was obtained from each patient's clinical chart by the research scientist. Data analysis was carried out using the chi-square statistic (Fleiss, 1973) and the log-linear model technique (Fienberg, 1978).

Results

A total of 56 patients were studied of whom 34 (60.7%) were men, 21 (36.2%) were less than 50 years old, and 43 (76.8%) were continuously hospitalized for more than 10 years. Thirty-three (58.9%) of the patients were rated normal on gag reflex with 8 (14.3%) rated variable, and 15 (26.8%) impaired. Initial analyses were carried out with the three dependent variable groups (Normal, Variable, Impaired). However, since the Variable and Impaired groups were virtually identical in their characteristics, these groups were combined in later analyses. There were no significant differences among the groups on the variables of age, sex, length of stay, extrapyramidal symptoms, or neuroleptic use as measured in chlorpromazine equivalents.

The Table shows the prevalence of gag reflex impairment among patients classified according to both presence or absence of tardive dyskinesia (using the ADS and AIMS) and use of anticholinergic medication. As indicated, the proportion of patients with gag reflex impairment is roughly

similar for patients with one or neither of these conditions, ranging from 12.5-33.3%. In striking contrast, almost three-fourths of those patients with tardive dyskinesia and using anticholinergic drugs showed gag reflex impairment, suggesting an interaction effect among these factors.

Discussion

Due to the highly selective nature of the patient population studied (long-stay schizophrenics exposed to long-term medication use), the generalizability of the present findings to more acute patient populations with heterogeneous drug use and diagnoses requires further replication. However, the prevalence of impaired gag reflex in these patients (41.4%) is remarkably similar to the figure found in the only previous report addressing this issue (Moore & Book, 1970).

The present findings suggest an interrelationship among tardive dyskinesia, the use of anticholinergic drugs, and impairment of the gag reflex. It is generally accepted that the use of anticholinergic agents aggravates the signs of tardive dyskinesia once the latter have been established (Gerlach, Reisby, & Randrup, 1974; Klawans, Goetz, & Perlik, 1980). The association of both these variables with impairment of the gag reflex is not as well defined.

Neurotransmitters involved in the gag reflex arc include glutamic acid (afferent impulses), dopamine (centrally), and nicotinic acetylcholine receptors at the afferent striated muscle motor end plate (DeJong, 1950; Kaelle, 1975). Dopamine has been shown in animal studies to both facilitate and inhibit swallowing under varying circumstances (Bieger, Giles, & Hockman, 1977). Thus, one possible explanation for the observed association among these three variables could be the hypothesis that the mechanism of impairment of the gag reflex is analogous to that of tardive dyskinesia, being a supersensitivity phenomenon related to prolonged block of dopamine receptors. The fact that the reflex is inhibited rather than exaggerated, which is the case in tardive dyskinesia, could suggest that there is a relative predominance in supersensitivity of inhibitory dopamine receptors over facilitating receptors which might be further enhanced by a central hypocholinergic effect induced by anticholinergic drugs. This hypothesis would be consistent with recent

Table

Tardive Dyskinesia, Anticholinergic Drug Use, and Pharyngeal Reflex

	Pharyngeal Reflex

*Significant at .02 level.

†Significant at .05 level.

evidence showing the existence of both inhibitory and facilitating dopamine receptors in various parts of the brain (Klawans et al., 1980).

Alternative hypotheses invoking a primary role for anticholinergic drugs in this mechanism seem less likely, in view of their relatively weak and inconsistent impact on the swallowing mechanism (Bieger et al., 1977), and the fact that they exert their influence only on muscarinic acetylcholine receptors, and thus should have no influence on the nicotinic receptors at the motor endplate (Richelson & Divinetz-Romero, 1977). The present data suggesting an interaction between tardive dyskinesia and anticholinergic drug use support this conclusion.

Whatever the underlying mechanism, the present study strongly suggests that patients with tardive dyskinesia receiving anticholinergic drugs are at extremely high risk of also having an impaired gag reflex. This finding reinforces the recommendation that anticholinergic agents be avoided in the treatment of patients with tardive dyskinesia although, as has been noted (Klawans et al., 1980), tardive dyskinesia and extrapyramidal symptoms can coexist and thus pose a therapeutic dilemma. It remains for further study to determine whether the discontinuation of these agents might result in a restoration of the gag reflex.

Lecithin Treatment of Tardive Dyskinesia—A Progress Report

Brian G. Anderson, M.B., Ch.B.,[1] Dean Reker, R.N.,[1] Miodrag Ristich, M.D.,[1] Eitan Friedman, Ph.D.,[2] Miriam Banay-Schwartz, Ph.D.,[3] and Jan Volavka, M.D., Ph.D.[1]

Tardive dyskinesia (TD) is thought to be related to an imbalance between the dopaminergic and cholinergic systems in the striatum (1). It is believed that there may be a relative deficiency of acetylcholine (Ach) neurotransmission in this area. Some studies have reported beneficial effects in TD using Ach precursors or agonists such as choline, lecithin or physostigmine (2,3,5,6). Lecithin contains phosphatidylcholine (PC) which is metabolized to choline. Oral administration of lecithin elevates plasma choline levels (7) and may increase brain choline and Ach levels (4). Different commercial lecithins contain varying concentrations of PC and impurities, e.g., fatty acids and phosphatidylethanolamine. The authors report progress in a study attempting to replicate beneficial effects of lecithin in TD.

Method

Subjects

Nine female inpatients who gave informed consent served as subjects. Prerequisites to enter the study were: 1) a history of neuroleptic treatment and 2) moderate to severe TD on the Abnormal Involuntary Movement Scale (AIMS) as judged independently by two experienced raters. Age range was 32-77 years (mean 62 yrs), diagnosis by Diagnostic and Statistical Manual-III (DSM-III) criteria was chronic schizophrenia, and three patients also had mild dementia. Duration of neuroleptic treatment was 2-21 years (mean 6 yrs); patients receiving neuroleptics at the beginning of the study had been on the same dosage for 4-12 months (mean 6 mos) and were maintained on this dosage throughout the study. Three patients had been on no medication for 6, 7, and 24 months. TD was assessed using AIMS for 2-8 months before entering the study. The state of dentition was as follows: two subjects were edentulous, four were pre-edentulous (i.e., only 1 or 2 teeth present), and three had poor dentition (i.e., 4-26 teeth missing).

Procedure

This is a crossover, placebo-controlled, double-blind study. The treatment and placebo periods lasted 4 weeks with pretreatment, washout, and posttreatment periods of 2,4, and 2 weeks, respectively. Lecithin or placebo was given in a milk shake at 8 a.m. and 4 p.m. TD was assessed weekly at the same time of day using AIMS, by two blind raters who had an interrater correlation coefficient of 0.93; videotapes of the examinations and polygraph recordings of facial movements were also taken. Weekly plasma choline levels were assayed, using the Jendin-Handin gas liquid chromatography (GLC) method, from blood samples drawn before the 8 a.m. dose. Other parameters measured weekly were the Brief Psychiatric Rating Scale, the Hamilton Depression Rating Scale, and weight.

Results

The first trial involving seven subjects and using Phospholipon-100 (American Lecithin Co., soyabean extract) at a dose of 31.5 gm/70 kg/d showed no change in TD ratings in the presence of consistently elevated plasma choline levels while taking lecithin (Table). Phospholipon-100 was initially chosen because it has one of the highest concentrations (93.5%) of PC. There were no side effects. An attempt was then made to replicate the findings of Jackson, Nuttall, Ibe, and Perez-Cruet (1979), who reported improvement in TD using Type IXE lecithin (Sigma Chemicals, egg-yolk extract) which has 54% PC. The dosage of 50 gms/70 kg/d used by Jackson et al. (1979) was given to five subjects in the present study for 3

weeks. Again, no improvement in TD was noted in the presence of consistently elevated plasma choline levels while receiving lecithin (Table). Because there were no adverse side effects from Phospholipon-100, a trial has been completed in three subjects using a higher dose of this lecithin, i.e., 50 gm/70 kg/d. These subjects all showed a reduction in AIMS scores during the second week of treatment, but this was not sustained throughout the 4-week treatment period (Table).

Table

AIMS Scores* and Plasma Choline Levels†

	Baseline 2 Wks Mean	Lecithin Treatment (Wks) 1	2	3	4	Placebo 4 Wks Mean
		Phospholipon-100 31.5 gm/70 kg/d				
AIMS ($N=7$)	15.6	15.8	16.6	16.8	16.4	15.7
Plasma Choline ($N=5$)	6.0	20.4	18.6	20.7	-	-
		Sigma IXE 50 gm/70 kg/d				
AIMS ($N=5$)	17.8	16.8	18.2	17.6	-	19.3
Plasma Choline ($N=2$)	8.6	20.9	27.8	31.6	-	8.6
		Phospholipon-100 50 gm/70 kg/d				
AIMS ($N=3$)	15.5	15.8	11.0	12.8	14.8	15.5
Plasma Choline ($N=3$)	8.4	32.9	33.3	-	28.8	-

*AIMS scores are the sums of items 1-7 on the AIMS scale and are shown as the average for *N*, the no. of subjects.

†Plasma choline levels are in *n* moles/ml. and are the averages for *N* subjects.

Discussion

The investigators were unable to show improvement in TD using two different lecithins. The patient group described here is similar to that of Jackson et al. in terms of diagnosis, age, and sex. However, there may be various subtypes of TD which are biochemically different but clinically indistinguishable from each other; such differences in patient selection may account for the failure to replicate Jackson's results. Furthermore, it is possible that patients vary in their permeability of the blood-brain barrier for choline and, therefore, raising plasma choline may have quite different effects on choline levels in the brain in different patients. Finally, the number of patients in the reported study, as well as in other reports, is still far too small for a conclusive statement; the investigators are studying additional patients.

Effects of AMPT on Tardive Dyskinesia and Psychosis

Henry A. Nasrallah, M.D.,[1] Robert E. Smith, M.D.,[1] Frederick J. Dunner, M.D.,[1] and Mona McCalley-Whitters, B.S.N.,[1]

Dopamine (DA) receptor supersensitivity in the striatum after chronic neuroleptic intake is believed to be the basic pathophysiology of tardive dyskinesia (Klawans, 1973). In addition, DA receptor supersensitivity in the mesolimbic and mesocortical tracts has been suggested as possibly associated with psychosis (Davis & Rosenberg, 1979). DA antagonists such as receptor blockers (neuroleptics), stores depletors (reserpine), and synthesis inhibitors (alpha methyl paratyrosine) (AMPT) are known to mask tardive dyskinesia (Baldessarini & Tarsy, 1978).

AMPT has been shown to potentiate the antipsychotic effect of neuroleptics (Carlsson, Persson, Roos, & Walinder, 1972) but not in neuroleptic-resistant schizophrenic patients (Nasrallah, Donnelly, Bigelow,et al. 1977). AMPT has also been reported to improve the symptoms of tardive dyskinesia in about 50% of patients receiving 4 g/day for 3 days (Gerlach, Reisby, & Randrup, 1974; Gerlach & Thorsen, 1976).

In this study, the effects of AMPT on tardive dyskinesia and psychosis are described.

Method

Six patients with chronic schizophrenia or schizoaffective psychosis and persistent tardive dyskinesia of over 2 years' duration, consented to participate in the study. Their ages ranged from 26 to 71 years. Three patients were drug-free at the time of the study, while three others were receiving maintenance neuroleptic medication. Identical capsules of AMPT and placebo were given in a double-blind, crossover (placebo-active-placebo) design. Depending on body weight, patients received 1.5 to 3.0 g/d of AMPT for 4 weeks, with 2-3 weeks of placebo before and after. Weekly videotapes of the Abnormal Involuntary Movement Scale (AIMS) were randomized and rated blindly by two psychiatrists. Psychosis was rated weekly using the Brief Psychiatric Rating Scale (BPRS).

Results

The results are summarized on the Table. Five out of six patients had a reduction in their tardive dyskinesia AIMS scores after 2 weeks of AMPT. However, after 2 more weeks of treatment with AMPT, four patients showed worsening of tardive dyskinesia while two patients had sustained improvement.

As for the psychosis ratings, after 2 weeks of AMPT treatment the BPRS scores improved for one patient, worsened for two others, and were essentially unchanged for three patients. After 4 weeks of AMPT treatment, all three patients who were receiving maintenance neuroleptic medication showed improvement in the BPRS scores, while all three neuroleptic-free patients showed worsening of their psychosis ratings.

Discussion

The data suggest that AMPT improves tardive dyskinesia initially, probably by inhibiting DA synthesis and decreasing the availability of DA to supersensitive postsynaptic DA receptors. However, continued treatment with AMPT appears to cause a rebound increase in postsynaptic DA receptor supersensitivity (Nasrallah et al., 1977) associated with a reappearance of the dyskinetic symptoms. This suggests that AMPT may not be useful in the long-term treatment of tardive dyskinesia, and that inhibition of DA synthesis probably would not correct the underlying pathophysiology of tardive dyskinesia.

The effect of AMPT on psychosis in this study suggests that AMPT, given alone, may exacerbate psychosis, but if the patient is already on a regimen of antipsychotic medication, then the addition of AMPT seems to produce further improvement in psychosis ratings.

It is possible to postulate that prolonged treatment with AMPT alone in schizophrenic patients may induce DA receptor supersensitivity in both the nigrostriatal as well as mesolimbic DA tracts, which would clinically manifest as tardive dyskinesia and psychotic relapse, respectively.

Receptor Sensitivity Modification in the Treatment of Tardive Dyskinesia[1]

Murray Alpert, Ph.D.,[2] Florence Diamond, M.S.,[2] and Arnold J. Friedhoff, M.D.[2]

Increase in dopamine receptor sensitivity is widely thought to underlie tardive dyskinesia (TD) (American Psychiatric Association, 1979). The increased sensitivity is postulated to be a compensatory reaction to the decreased access of dopamine to the postsynaptic receptors through the blocking action of neuroleptic drugs. This study explores a novel treatment approach to TD (Friedhoff & Alpert, 1978); testing the hypothesis that dopamine sensitivity can be down-regulated by temporarily increasing dopamine levels. To accomplish this, increasing doses of L-DOPA are gradually administered, waiting at each dose increment for evidence of adaptation. Following adaptation to a 1-month course of treatment at the target dose, the L-DOPA is discontinued. It is expected that improvement will persist if normal receptor sensitivity is reestablished, and transmitter levels are permitted to return to their usual levels.

Method

Subjects

Subjects were patients in state hospitals who met the following inclusion criteria: 1) a history of at least 2-years' neuroleptic medication; 2) no evidence of abnormal movements prior to receiving neuroleptic drugs; and 3) at least three ratings of mild or one rating of moderate severity of movements on Items 2 (lips), 3 (jaw), and 4 (tongue) of the Abnormal Involuntary Movement Scale (AIMS) (Guy, 1976). Initially only drug-free patients were included, but the study was extended to include patients requiring maintenance neuroleptics. Patients were followed for a period of at least 6 weeks prior to baseline during which they remained drug free or their neuroleptic medication remained unchanged. Anticholinergic drugs were not permitted. Inclusion Item 3 had to

[2] Department of Psychiatry, New York University Medical Center, New York, NY 10016.

be satisfied at the baseline rating just prior to initiation of L-DOPA treatment.

Procedure

Patients were randomly assigned by a nonblind medicating psychiatrist to one of three target doses of carbidopa/L-DOPA as Sinemet: 30/300 mg/d, 50/500 mg/d, and 75/750 mg/d, which was administered orally in divided doses with meals. There was a dose-finding period of 4 weeks during which the dosage was increased as frequently as once a week, and the target dose was maintained for an additional 4 weeks. Increments in dosage were skipped and the dose-finding phase extended if the patient showed evidence of hypotension or significant activation of movement or behavior. In some cases, the target dose was continued to synchronize with the blind evaluators, visit. Patients were treated for an average of 72 days with a range of 56-126 days and received between 11.8 and 54 g of L-DOPA. Six patients received less than 21.9 g and nine patients received more than 33.9 g. These two groups will be reported as low-dose and high-dose groups.

The AIMS was administered as recommended by the Psychopharmacology Research Branch* of the National Institute of Mental Health (NIMH) (Guy, 1976) at baseline, weekly during L-DOPA treatment, and 4 weeks following termination of L-DOPA, which served as an outcome measure. Evaluators were blind as to dose and to where the patient was in the course of treatment. Sedatives were permitted throughout the trial but not within 12 hours of an AIMS rating.

The authors found that summing the AIMS scores is a less satisfactory reflection of pathology, and the data presented here have been derived by squaring the item score before summing. The rationale for squaring and the psychometric properties of the squared scores will be described separately (Alpert, Diamond, & Taleporos, Unpublished data). Intuitively, it may be seen that a patient with three scores of 1 should not be seen as showing equal pathology as a patient showing one score of 3. Squaring the scores, then summing, is a more adequate reflection of pathology.

Abnormal Movements of L-Dopa Treated (N=15) and Comparison Group of Equivalent Baseline Pathology (N=10). Second Rating Is Four Months After Baseline.

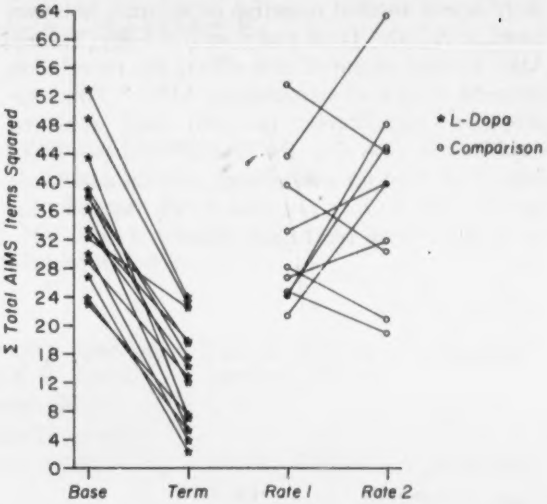

FIGURE 1

Results

Baseline and termination AIMS² Total for 15 patients treated with L-DOPA were compared with 10 patients who met the inclusion criteria but who were not treated with L-DOPA and were evaluated using the AIMS on two occasions approximately 12 weeks apart. The comparison group was matched with the experimental group for age, sex, and baseline AIMS score, but did not receive placebo. (Figure 1). Patients treated with L-DOPA uniformly showed some improvement at termination ratings and for about half the patients the change was clinically significant. Such changes were not apparent in the comparison group. One-way analysis of covariance for AIMS² Total, covarying baseline score, showed a reliable effect for L-DOPA treatment ($F = 25.90$, $p < .001$, *df* 2,22).

A comparison of low-dose ($N = 6$) and high-dose ($N = 9$) L-DOPA groups at baseline and termination AIMS² Total demonstrated relatively similar slopes, but the high-dose group showed more frequent "good" outcomes (Figure 2). It can be seen that the six lowest scores at termination were obtained by the high-dose group. Through randomization, the low-dose group may have had slightly higher baseline scores; in a multiple regression analysis examining the effect of dose, there was a modest negative correlation between baseline AIMS^2 Total and dose ($r = -.28$) (Table). After having removed this effect, the correlation between dose and termination AIMS^2 Total approached significance ($p = .08$) and achieved significance ($p = .05$) for Facial^2 scores. Since there was random assignment to dose and blind ratings, this finding provides further support for the suggestion of treatment efficacy.

Comparison of Outcome for Low and High Dose L-Dopa Treatment

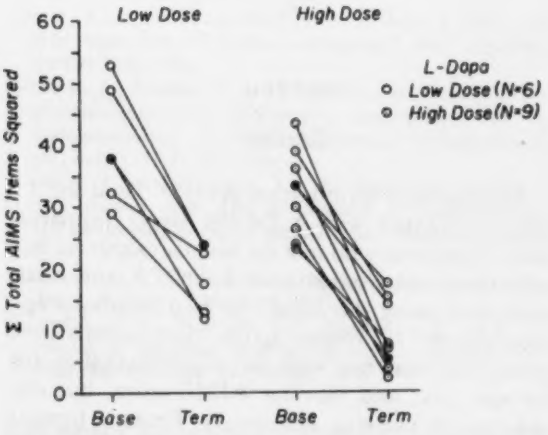

FIGURE 2

Discussion

This report describes a dose ranging study of a novel treatment approach to TD based on the assumption that the TD is related to an underlying pathogenic dopamine receptor supersensitivity, and that this supersensitivity may be reversed if dopamine levels are increased. In these trials it was found that dopamine levels may be safely increased in psychotic dyskinetic patients if incremental steps are carefully controlled. When this is done, there is some evidence that dyskinetic movements may be modestly exacerbated initially, especially for patients who are not receiving neuroleptic medication. With adaptation to the L-DOPA, the movements are reduced while the medication is continued. When the medication is stopped and the patients evaluated 4 weeks later, a reduction in dyskinetic movements was observed and about half the patients showed a marked improvement. Greater improvement was more likely in patients treated at higher doses. The level of improvement appears to be independent of whether the patient is also receiving a neuroleptic drug.

Combination Choline/Piracetam Treatment of Senile Dementia[1]

Steven H. Ferris, Ph.D.,[2] Barry Reisberg, M.D.,[2] Eitan Friedman, Ph.D.,[2] Michael K. Schneck, M.D.,[2] Kathleen A. Sherman, Ph.D.,[2] Pervez Mir, M.A.,[2] and Raymond T. Bartus, Ph.D.[2]

Despite the compelling rationale for precursor therapy of Primary Degenerative Dementia (PDD, also known as Alzheimer's disease) a large number of clinical trials have failed to demonstrate a consistent pattern of clinically significant effects for either choline or lecithin (Ferris, Sathananthan, Reisberg, & Gershon, 1979; Pomara, Reisberg, Ferris, & Gershon, 1981). Similarly, treatment with the "metabolic enhancer" Piracetam alone also does not appear to improve the cognitive symptoms of senile dementia (Reisberg, Ferris, Schneck, et al., 1981). However, the possibility exists that drugs which enhance brain metabolism might potentiate the effects of cholinergic precursors (Ferris, 1981; Gibson, Shimada, & Blass, 1978). Bartus, Dean, Sherman, & Friedman (1980) treated aged rats with both choline and Piracetam, and demonstrated a synergistic effect on memory retention. Since brain metabolism is reduced in aging and dementia (Ferris, de Leon, Wolf, et al., 1980; Smith, Goochee, Rapoport, & Sokoloff, 1980; Sokoloff, 1979), it may be that a general increase in metabolism improves the possibility of increasing acetylcholine synthesis. Piracetam may also have more direct cholinergic effects, since it increases the incorporation of ^{32}P into phosphatidyl choline (Woelk, 1979) thus suggesting an increase in phosphatidyl choline turnover. We therefore conducted an initial clinical trial in dementia with combination choline/Piracetam treatment.

Method

Subjects

A total of 15 outpatients, aged 60-85, with a Diagnostic and Statistical Manual-III (DSM-III) diagnosis of PDD completed the study. The patients all showed objective evidence of very mild to moderate cognitive impairment secondary to PDD. The diagnostic evaluation was based on DSM-III criteria and included a medical history,

Development and Prediction of Postpsychotic Depression in Neuroleptic-Treated Schizophrenic Patients

Joanne B. Severe, M.S.,[1] Michel R. Mandel, M.D.,[2] and Nina R. Schooler, Ph.D.[1]

This paper concerns the emergence of depressive symptomatology in schizophrenic patients who were treated in the community with maintenance neuroleptic drugs. It has been reported by several investigators that schizophrenic patients demonstrate depressive symptoms at various times during their illness (Stern, Pillsbury, & Sonnenberg, 1972; McGlashan & Carpenter, 1976). However, there are problems in defining and describing these symptoms. Some investigators claim that such symptoms are part of the natural course of the disorder (Roth, 1970), others that they are side effects (akinesia) of neuroleptic drugs (Rifkin, Quitkin, & Klein, 1975), and still others feel that such symptoms call the diagnosis of schizophrenia into question (Goplerud & Depue, 1978).

Because of reports of postpsychotic depression (PPD) in the literature, data were examined which were available from a National Institute of Mental Health (NIMH) multicenter collaborative trial which specifically compared injectable fluphenazine (FPZ) decanoate with oral FPZ hydrochloride (HCl) in outpatient schizophrenics being maintained in the community for up to 1 year (Schooler, Levine, Severe, Brauzer, DiMascio, Klerman, & Tuason, 1980). This study was not designed to specifically address the question of PPD and therefore lacks the placebo control necessary to determine whether the emergence of depressive symptoms is a result of neuroleptic therapy or is a part of the natural course of the disorder. However, the data can address the following questions: What is the rate of emergence of depression in FPZ-treated schizophrenic outpatients over the course of 1 year? Is this rate higher in patients treated with FPZ decanoate than in those treated with oral FPZ HCl? Are patients who develop depressive symptomatology more likely to relapse? Can development of depression be predicted from presenting psychopathological symptoms at the time patients were acutely ill or from social, family, psychiatric, and treatment histories?

Depressive symptomatology was measured using the 22-item version of the Hamilton Depression Scale (HDS). The scale was completed at intake, at start of community maintenance treatment, and at 4-month intervals. Depression was defined as an HDS Total Score of 16 or greater. Therefore, depression, here, is not the equivalent of a clinical diagnosis of depressive disorder.

Two-hundred eleven patients who were discharged from the hospital depression free and had subsequent HDS ratings were included in these analyses. Forty-seven (22%) attained an HDS Total Score of 16 or greater (25% FPZ HCl and 22% FPZ decanoate, N.S.). As shown in the Figure, 73% of these patients remained depression free and most of the depression that did occur developed by about the fifth to sixth month post discharge. In addition, the Figure demonstrates that there were no differences in development of depressive symptomatology between the drug treatment groups.

PROPORTION OF PATIENTS REMAINING DEPRESSION-FREE OVER TIME USING HDS CRITERION (FOR ALL CASES AND SEPARATELY BY TREATMENT)

FIGURE

Comparison between the depressed and nondepressed patient groups revealed that the depressed patients were significantly more likely to relapse (64%) than were the nondepressed patients (19%). In one-third of the depressed patients who relapsed, depressive symptoms and the need to treat them were mentioned as part of the reason for the termination. Therefore, development of depression is a clinically important factor in the failure of the study treatments for these patients.

Further comparisons between the depressed and nondepressed patient groups with regard to baseline symptomatology revealed that when there were differences between the groups, depressed patients had less florid psychotic symptomatology as measured by grandiosity, uncooperativeness, and excitement on the Brief Psychiatric Rating Scale, but not greater despondency of mood. In addition, depressed patients exhibited more somatic symptoms as measured by the HDS at baseline. With regard to computerized tomography scan, medical and neurological examinations, clinical laboratory tests, psychiatric evaluations, and objective cognitive tests which included the Guild Memory Scale (Crook, Gilbert, & Ferris, 1980). Patients with a Hamilton Depression Scale score greater than 18 were excluded. The patients selected had Global Deterioration Scale scores of 2-4 (Reisberg, Ferris, de Leon, & Crook, in press).

Procedure

This was an open study designed to verify the safety and tolerance of combined choline/Piracetam treatment, and to obtain preliminary evidence as to possible efficacy. Patients received 9 g/d of choline chloride and 4.8 g/d of Piracetam for a period of 7 days. A short cognitive test battery (Buschke task, First-Last Names, facial recognition, Digit Symbol Substitution Test and tapping speed) and behavioral rating scales (IPSC-E psychiatrist's scale and MS-E self-rated mood scale) were administered at baseline and following the treatment period. Plasma and red blood cell (RBC) choline levels were also determined for 10 of the 15 subjects.

Results and Discussion

No side effects were reported. For the entire group, most cognitive measures showed small, nonsignificant improvements. Some subjects showed no changes, but none were worse. Since the study psychiatrist independently rated four patients as clinically improved, the cognitive measures for these patients were analyzed separately. The results for the Buschke Selective Reminding Task are shown in Figure 1. Each patient showed marked improvement in memory storage and retrieval. These "responders" were all subjects with moderate rather than very mild cognitive impairment. We have not previously observed such marked clinical improvements with choline treatment alone (Ferris et al., 1979; Ferris et al., 1981) or Piracetam treatment alone (Reisberg et al., 1981).

The results for the blood choline assays are shown in Figure 2. Of the 10 subjects for whom data were available, all showed marked increases

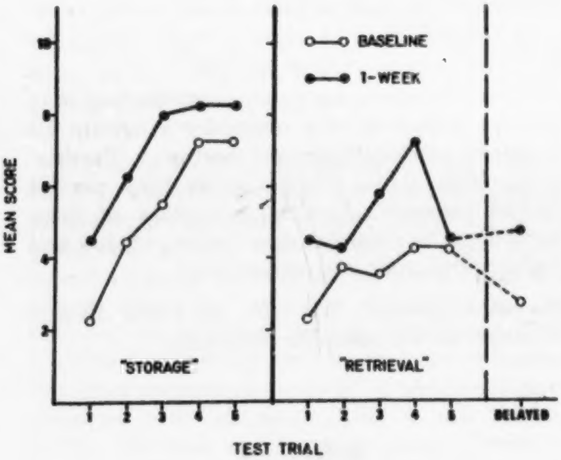

FIGURE 1. Mean scores for "storage" and "retrieval" on the Buschke Selective Reminding Task for the treatment "responders" ($N=4$) before and after treatment for 1 week with choline + Piracetam.

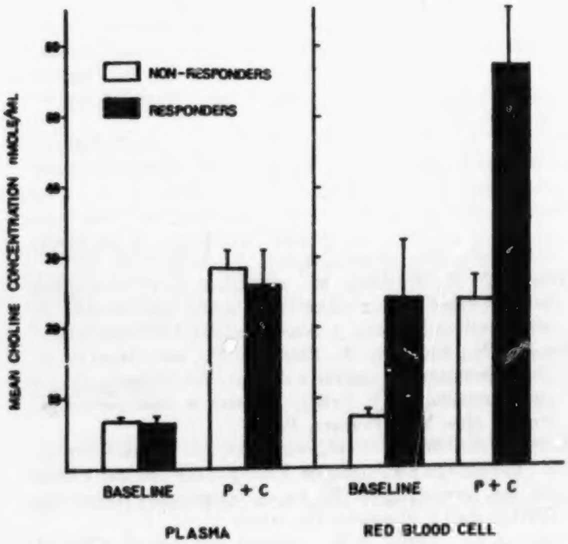

FIGURE 2. Mean (± SEM) plasma and red blood cell choline concentrations for the responders ($N=3$) and nonresponders ($N=7$), before and after 1 week of treatment with choline + Piracetam.

in both plasma and RBC choline levels during treatment. However, the responders showed much higher RBC choline levels than the nonresponders, both at baseline and during treatment (p's $< .025$). The plasma choline levels for the two groups were quite similar.

These interesting but preliminary findings suggest the possibility of a responder subgroup for combined choline/Piracetam treatment. Furthermore, high RBC choline levels may predict clinical response. Further evaluation of these possibilities by means of dose-finding studies and double-blind trials is recommended.

Acknowledgment: We wish to thank Denise Hernaize for her valuable assistance.

life history characteristics, depressed patients were more likely to have a history of antidepressant and/or stimulant use, have been hospitalized for psychiatric illness in the past more often, and have had the truth about their illness told to family and friends.

The combination of the measures of somatic symptoms, grandiosity, prior use of stimulants, and the veracity of the explanation of the patient's hospitalization accounted for 19% of the variance in the prediction of depression status. Using the jackknife procedure (Mosteller & Tukey, 1977), a technique for replication which provides a more reliable estimate, 13% of the variance in depression status was accounted for. Despite the shrinkage, this is still significant. Thus, these data are able to provide some clues for prospective identification of those schizophrenic patients who will develop depressive symptomatology.

It is clear that depressive symptomatology in schizophrenic patients is a real problem and that more research is needed to better understand the phenomenon. The relationship of depression and relapse highlights the more pressing need for research into treatments for these symptoms.

Plasma Levels of Thiothixene by Radioreceptor Assay and Clinical Outcome[1]

Theodore van Putten, M.D.,[2] Philip R.A. May, M.D.,[2] Stephen R. Marder, M.D.,[2] and Jeffrey N. Wilkins, M.D.[2]

If plasma levels of antipsychotic drug were to relate to clinical outcome, the pharmacotherapy of schizophrenia might become less of a frontier profession. So far, research on the relationship between plasma levels of antipsychotic drugs and clinical outcome has been disappointing. On balance, few relationships have been found. This could be due to design deficiencies such as flexible dosage or contamination by other treatments or to problems with the assay (May & van Putten, 1978). The new radioreceptor assay (Creese & Snyder, 1977) appears simple to perform, sensitive, and suitable for routine clinical use.

The obvious question is whether the radioreceptor assay is clinically useful: specifically, does the assay correlate with clinical outcome or side effects?

Method

Thirty-four newly admitted schizophrenic patients who had not taken antipsychotic medication for at least 2 weeks (the majority not for several months) were treated with a fixed dose of thiothixene for 4 weeks. In general, these patients were admitted voluntarily (92%); in young middle age (mean age 32.7 years, SD 9.9); never married (50%); with a chronic disorder (mean duration of 5.2 years, SD 5.6).

Treatment

A fixed thiothixene dosage was given daily for 4 weeks at bedtime (0.44 mg/kg or 0.2 mg/lb). If there had been a serious toxic reaction to the first dose, the dosage was fixed at a lower level. Antiparkinson drugs were given if extrapyramidal side effects were troublesome.

Thiothixene Assay

Thiothixene and its active metabolites were measured in plasma by Creese and Snyder's radioreceptor technique in which the added drug competes with [^{3}H]-spiperone for binding to dopamine receptors in calf caudate membranes (Lader, 1980).

Dopamine receptor-blocking activity of drug in the plasma samples was expressed as neuroleptic units (n.u.). One n.u. is defined as the amount of displacement of tritiated spiperone produced by 1 nmole of haloperidol.

The lower limit of sensitivity is 15 n.u.

Outcome Measures

Clinical outcome was measured before and after treatment on the Brief Psychiatric Rating Scale (BPRS) (completed by the psychiatrist) and by a Clinical Global Improvement Scale (CGI) and the Nurses' Observation Scale for Inpatient Evaluation (NOSIE) taking change in total score from baseline to the end of treatment as the criterion. The raters were blind to the plasma measurements.

Results

Relation to Outcome

Figure 1 shows the relationship between the nurses' global improvement ratings and plasma level. Improvement occurred over the entire range of recorded plasma levels, but the chances of substantial improvement appear greater above 40 n.u. If the sample is dichotomized to compare (very much + much improved) vs. (minimally improved + no change) with 40 n.u. as the criterion, chi square = 6.05, $p < .01$. The results with physician's global improvement ratings showed a similar trend, but the chi-square missed statistical significance.

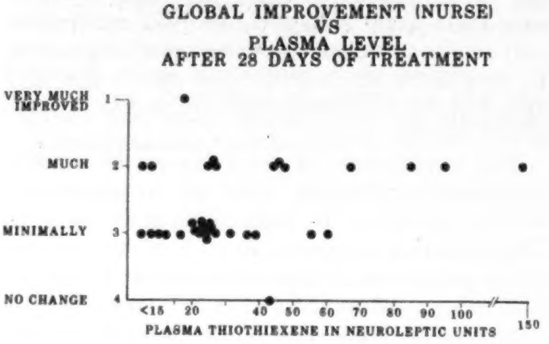

FIGURE 1

Figures 2 and 3 show the relationship between the NOSIE and BPRS change scores and plasma level. The trend is the same: improvement occurs over the entire recorded range of plasma levels, but the chances of substantial improvement appear greater above 40 n.u. It is clear, however, that many patients improved at lower neuroleptic levels; the relationship is far from substantial.

Correlations between plasma levels and outcome (both at 28 days) appear in the Table. Correlations for the doctor's CGI and NOSIE were significant at the .025 level.

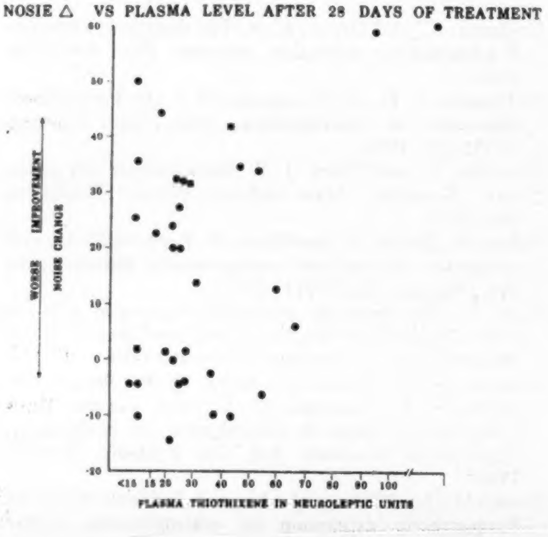

FIGURE 2

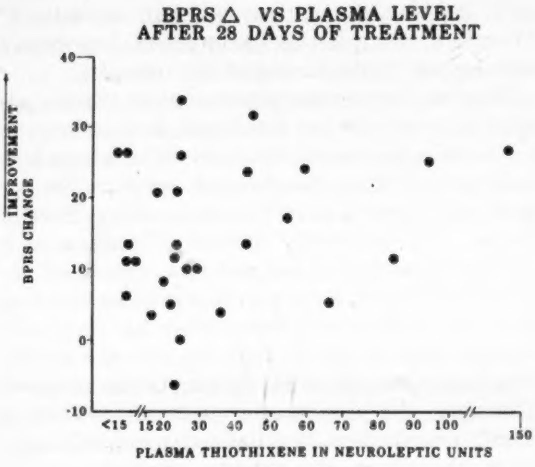

FIGURE 3

Relation to Side Effects

There was no consistent relationship between side effects after 4 weeks of treatment and plasma level. Some of the highest drowsiness ratings occurred in those with very low plasma levels. Similarly, there was no consistent relationship between akathisia or akinesia and plasma level.

Dosage and Outcome

There was no relationship between dosage (either mg or mg/kg) and any of the four outcome measures.

Discussion

The findings indicate that improvement is more likely at higher plasma levels (>40 n.u.) of thiothixene. Many, however, improved at very low plasma levels. Indeed, two of the six who improved at plasma levels < 15 n.u., had an illness which, in the past, responded only to an antipsychotic drug.

The data do not support the notion of a "therapeutic window" in that higher plasma levels were not associated with side effects or clinical deterioration (although at extreme plasma levels this must of course be so). In fact, an additional four patients who improved markedly only on very high doses (60, 120, 120, and 160 mg of thiothixene) had high plasma levels (65, 78, 170, and 140 n.u., respectively). Again, higher plasma levels appear associated with improvement, as long as the patient can tolerate them!

In 11 of 20 nonresponders, dosage could not be increased because of akathisia, drowsiness, or akinesia, either singly or in combinations. A plasma level of thiothixene may be particularly useful in the nonresponder with troublesome side effects. If such a nonresponder has a low plasma level (<40 n.u.), it would seem prudent to switch to another antipsychotic drug.

The Effects of Psychotropic Drugs on Informed Consent[1]

Barbara Stanley, Ph.D.,[2] Michael Stanley, Ph.D.,[2] Eric Peselow, M.D.,[3] Adam Wolkin, M.D.,[3] Steven Deutsch, M.D.,[3] Laura Platt, M.S.W.,[3] Julie Speicher, M.D.,[3] Lynn Golash,[3] and Michael Kaufman, M.D.[4]

Acutely psychotic patients are frequent candidates for research projects which attempt to find more efficacious pharmacologic treatments for their conditions. These patients are often the only appropriate group for the final stage of testing the treatments. However, there is a good deal of concern about the abilities of hospitalized psychiatric patients to give consent. This concern is reflected by their status as a vulnerable population in the proposed regulations for the institutionalized mentally disabled (*Federal Register*, 1978). This classification deems them as needy of special protection. While there are many different opinions about the extent of their vulnerability, there are little empirical data which confirm the need for this proposed special protection.

Earlier research investigating this issue found that severely ill psychiatric patients perform as wellin the consent process as hospitalized medical patients (Stanley, Stanley, Schwartz, 1980; Stanley, Stanley, Lautin, Kane, & Schwartz, 1981). These findings indicated that it was important to look more closely at consent with the mentally ill.

Issues such as the differential effects of diagnosis, mood, and length of hospitalization on competency are in need of investigation. Further, there remains a question about the effect of psychotropic medication on patients' competency. Some have argued that patients would alter their opinions about participation in research or become more competent following stabilization on psychotropic drugs. On the other hand, it has also been argued that a consent obtained under the influence of psychotropic drugs can never be valid because the patient is "mind-controlled." Therefore, this question has practical importance with respect to the timing of the consent.

Does an investigator obtain consent while a patient is acutely ill, or should he first attempt to bring the symptoms under control with standard treatments, obtain the consent, washout the patient, and then conduct the experiment? This, of course, is procedurally difficult. However, if it can be demonstrated that patients make more rational decisions about research participation when they are medicated, then the procedural difficulties might be justified for the sake of a significant improvement in the quality of the consent. Therefore, the present study was undertaken to determine whether hospitalized psychiatric patients' abilities to give consent, change over the course of treatment—prior to a drug regimen and after stabilization on psychotropic medication.

In this preliminary study, the following questions were addressed: 1) do severely ill psychiatric patients alter their opinions with respect to their willingness to participate in a series of research projects with varying risk/benefit ratios prior to drug treatment and after becoming stabilized? 2) does comprehension of consent information increase following drug treatment? 3) does rationality or reasoning about their decision to participate or not participate improve after drug treatment? and 4) for those patients who changed their minds, did they become more reasonable in their decisions?

Method

In order to assess the effects of psychotropic medication on ability to give valid consent, a series of four hypothetical vignettes were administered to psychiatric patients prior to drug treatment and following treatment. Two of the vignettes were alternate forms of one high-risk/low-benefit vignette and one low-risk/high-benefit vignette. The other two vignettes were both administered twice. Patients' competency to give consent was assessed on four separate dimensions which represent common notions of competency (Sullivan, 1974; Friedman, 1975; Roth, Meisel, & Lidz, 1977): evidencing a choice;

reaching a reasonable decision; comprehending the consent information; and reasoning in a rational manner about the decision.

In order to determine whether the patients' psychiatric conditions improved, a psychiatrist independently assessed the patients on admission and again at the time of the second competency interview. The Brief Psychiatric Rating Scale (BPRS) was utilized for the psychopathology assessments.

The sample was comprised of 39 psychiatric inpatients on a locked unit at Bellevue Psychiatric Hospital. All were interviewed within 72 hours after admission and again just prior to discharge. In most cases, patients were discharged within a day after the final assessment. When patients were not immediately discharged, it was usually as a result of disposition problems. Twenty-seven patients received psychotropic medication and 12 patients were unmedicated and served as a comparison group to control for the effects of hospitalization.

Table 1 shows the diagnostic categories into which the medicated patients fell. All but one—the personality disorder—fell into the range of very severe psychiatric illness. Table 2 shows that the medications these patients were taking at the time of discharge were the standard psychotropic drugs. The length of time patients were medicated coincides with the length of hospitalization ($\overline{X}$ = 27 days; *SD* = 12.6).

All medicated patients were judged by the treating psychiatrist to be stabilized on medication by the final competency assessment.

Results

To determine the effect of drugs on decisions about research participation, patients' responses to the hypothetical studies were analyzed. Responses prior to drug treatment and following treatment were compared. The percentage of patients who did not alter their opinions and those who did are presented in Table 3.

For the high-risk/low-benefit studies, about 15% of the patients agreed to participate both before and after treatment, while 37% refused both times. In this case, refusal would be the reasonable decision, because of the unfavorable risk/benefit ratio. Twenty-six percent changed from agreeing to refusing and about an equal percentage (22%) changed in the opposite direction from a reasonable or "good" decision to a poor choice. A statistical test of the difference in proportions for the four possible comparisons shows no significant differences among the proportions (HR/LB Study – $z = .39$, $N = 27$, NS). Thus, for the first study, patients do not become more or less reasonable in their decisions as a result of treatment.

This was also true for the other three vignettes (LR/HB Study $z = .27$, $N = 27$, NS; HR/HB Study $z = .14$, $N = 18$, NS; MR/HB Study $z = .85$, $N = 18$, NS). There was no significant directional change following any treatment. When patients change their minds, about an equal percentage moves in either direction. It is particularly striking to note about the last three vignettes that two-thirds of the patients do not change their minds at all. This suggests that drug treatment does not alter patients' decisions about research.

In comparing the drug-treated group with the group of patients who received no medication during their hospitalization, no significant differences emerged in willingness to participate in hypothetical studies. (Final Interview - HR/LB Study $x^2 = <1$, $N = 39$, NS; LR/HB Study $x^2 = <1$, $N = 39$, NS; HR/HB Study $x^2 = <1$, $N = 27$; MR/HB Study $x^2 = <1$, $N = 27$, NS).

Differences in comprehension of the consent information prior to and following drug treatment were also examined. Comprehension did not improve significantly ($t = 1.81$, $df = 17$,NS). An additional analysis of the patients' stated reasons for participation or refusal, revealed that the quality of reasoning about the consent decisions showed no significant improvement following treatment ($t = 1.57$, $df = 17$, NS). These findings are noteworthy because psychopathology decreased significantly (Initial BPRS scores $\overline{X} = 43.5$, S.D. $= 9.1$; final BPRS scores $\overline{X} = 38.3$, $SD = 7.9$; $t = 3.52$, $N = 27$, $p < .01$). Thus, although patients' conditions improved, their competency did not. This is consistent with previous findings which suggest that psychopathology does not correlate with ability to give consent (Stanley et al., 1981).

In conclusion, these preliminary results seem to indicate that the quality of consent does not improve following drug treatment. These data do not lend support to the notion that patients should be stabilized on standard drugs prior to enlisting them as subjects. Additional data are now being collected to determine whether these preliminary results will remain the same with a large sample.

Research Use of the Early Clinical Drug Evaluation Unit Data Bank

John E. Overall, Ph.D.,[1] and Howard M. Rhoades, M.A.[1]

The purpose of this brief report is to indicate one way in which the research potential of the Biometrics Laboratory Early Clinical Drug Evaluation Unit (ECDEU) data bank has been used for general methodological investigations. The Biometrics Laboratory at George Washington University provided a statistical data-analysis service for investigators in the ECDEU and New Clinical Drug Evaluation Unit (NCDEU) programs for almost a decade. During that time, a valuable data bank consisting of rating scales and other descriptive information on large numbers of patients was acquired. As far as the present report is concerned, it is important to emphasize that the data bank pertains specifically to patients who were subjects in clinical psychopharmacology research.

A problem in dealing with a data bank of this magnitude is that different studies use different rating scales and have differing protocols. In order to effectively manage this amount of data, an extraction was made so that each subject would have comparable data in a standard format. Patients included in this extraction were required to have at least the demographic information, a pretest rating on the Brief Psychiatric Rating Scale (BPRS), and a rating on the BPRS that fell 6 to 12 weeks after the onset of the clinical trial. The data to be presented refer to those patients and to studies that included a minimum sample size of at least six per group. Studies in which the BPRS was not used and studies with very small sample sizes were not included.

The first question that was asked of the derived data file concerned how many different drug treatment *populations* are represented. For this purpose a "drug treatment population" was defined as the population from which subjects for a particular study were drawn, and two studies were considered to involve the same drug treatment population if the mean symptom profiles for patients in the studies were similar. A multidimensional scaling of mean pretreatment BPRS profiles revealed two major clusters, one including studies of antipsychotic drugs and the other including studies of antidepressant/antianxiety drugs.

The fact that the data bank consists of two major treatment populations does not imply that individual patients within those treatment populations are phenomenologically homogeneous. An iterative profile analysis method was used to define BPRS profile patterns that are maximally representative of four phenomenological subtypes of depressive disorders within the one treatment population and maximally representative of four phenomenological subtypes of thinking disorder psychoses within the other treatment population. Depressive disorders are characterized as anxious, hostile, retarded, or agitated; and thinking disorder psychoses are characterized as florid, withdrawn-disorganized, hostile-suspicious, or agitation-excitement types. Although this typology of major psychiatric disorders is not new, its refinement to be maximally representative of patients in the ECDEU data bank is considered pertinent to further clinical psychopharmacology research.

Classification functions, which are simple weighted combinations of BPRS symptom ratings (scored 0 to 6), can be used to assign individuals among the eight phenomenological types. The weighting coefficients derived from the ECDEU data bank are presented in the Table. To classify an individual patient, one simply calculates the eight different weighted sums of his/her BPRS symptom ratings and assigns the individual to the group for which the weighted sum is greatest. This is one of several ways that phenomenological classification can be objectively achieved from analysis of BPRS profiles. It is a very simple matter to write a computer program that will calculate the weighted sums, given the classification function coefficients presented in the Table.

Given the ability to assign individual patients among the eight phenomenological types, several issues related to clinical drug trials were investigated. The percentages of good response to placebo were examined across 6 controlled trials of presumed antidepressant drugs and 17 placebo-controlled trials of presumed antipsychotic drugs.

The placebo response rate for anxious and hostile depression subtypes was approximately two-thirds, whereas the placebo response rates for retarded and agitated depressions was only about one-third. Across a larger pool of studies, the response rate for all four depressive subtypes to active medications was approximately two-thirds. Although the placebo patients were not concurrent controls in most of the same studies from which the drug-treated patients came, the pattern of response across depressive subtypes does seem to suggest that it may be more difficult to show a true treatment effect in the anxious and hostile subtypes of depressive disorder because of the good placebo response of such patients.

The same comparisons of response rates were made for placebo and active drug groups in the pool of antipsychotic drug trials from the ECDEU data bank. Placebo response rates ranged from 6 to 29% for the four thinking disorder syndromes. The response rates for florid thinking disorder, agitation-excitement, and hostile-suspiciousness syndromes were two to four times greater in the active medication pool than in the placebo pool. By way of contrast, the response rate for the withdrawn-disorganized type was approximately 9% in both the placebo and active drug pools. Again, the placebo patients were not concurrent controls for most of the active medication patients in the pooled data; however, comparison of response rates across phenomenological subtypes suggests that withdrawn-disorganized thinking disorder may not be a good type of patient for demonstrating clinical efficacy of antipsychotic medications because of the low rate of favorable response to both drug and placebo.

Many other and perhaps more interesting uses can be made of the ECDEU data bank. The main intent of this brief report is to emphasize the advantage that can derive from large accumulations of similar data from many small clinical trials. Individual trials usually do not involve sample sizes adequate to examine many issues of both methododological and clinical importance. Centralized facilities that provide statistical support services are in a particularly strategic position to develop meaningfully large data banks in a variety of research domains, as the ECDEU data bank exemplifies in clinical psychopharmacology.

Diagnostic and Statistical Manual-III and the Children's Psychiatric Rating Scale[1]

Betty Pfefferbaum, M.D.,[2] and John E. Overall, Ph.D.[2]

The purpose of this investigation was to identify primary dimensions of manifest psychopathology that distinguish among different emotional and behavioral disorders of childhood and to identify the Diagnostic and Statistical Manual-III (DSM-III) diagnoses for which each of the primary dimensions is particularly relevant. The Children's Psychiatric Rating Scale (CPRS) provides for assessment of a broad range of symptoms and behaviors related to childhood psychopathology (Guy, 1976). It consists of 63 symptom and behavior constructs which are rated on seven-point scales of severity. It was used in this investigation because it preceded the development of DSM-III and provides a description of the major emotional and behavioral components of childhood diagnoses using terms other than the specific criteria listed in DSM-III. The methodology of factor analysis was used to identify clusters of correlated symptom and behavior variables that define major dimensions of difference among diagnostic groups in the CPRS measurement space.

Five child and adolescent psychiatrists were asked to provide descriptions of what they considered, from their clinical experience, to be typical patients belonging to each of 18 DSM-III diagnostic categories. The descriptions were recorded as ratings of symptom severity on the 63 scales of the CPRS. The psychiatrists were asked to describe levels of severity for all associated symptoms as well as for primary target symptoms of each disorder.

A cluster-oriented multiple-group method of factor analysis was used to identify subsets of variables that tend to represent independent aspects of the symptom domain. Seven independent dimensions were identified. The factors were

---

[1] This research was supported in part by USPHS Grant MH-32457.

[2] Department of Psychiatry, The University of Texas Medical School, Houston, TX 77025.

then rotated to an oblique simple structure in which each CPRS variable tended to relate clearly to one and only one of the seven references axes (Overall, 1974). The seven factors were interpreted as representing behavioral problems, depression, thought disturbance, psychomotor excitation, psychomotor retardation, nervousness/tension, and organicity.

A single CPRS profile to represent each of the 18 diagnostic concepts was calculated by averaging across the five raters. A transposed (Q-type) factor analysis of the 18 diagnostic profiles resulted in identification of six distinct clusters which are presented in Table 1. This analysis provided a basis for grouping together the DSM-III diagnoses that tend to share predominant features of the total symptom and behavior profile pattern, while disregarding specific distinctions that contribute little to the overall differences in symptom profile patterns. The diagnosis oppositional disorder did not clearly relate to only one cluster but related to the cluster including the conduct disorders and the cluster including the anxiety disorders. It was, therefore, not included in any one cluster.

Table 1

Cluster	DSM-III Diagnosis and Code
I	Conduct Disorder, Undersocialized, Aggressive (312.00) Conduct Disorder, Undersocialized, Nonaggressive (312.10) Conduct Disorder, Socialized, Aggressive (312.23) Conduct Disorder, Socialized, Nonaggressive, (312.21)
II	Infantile Autism (299.0x) Childhood Onset Pervasive Development Disorder (299.9x) Schizophrenic Disorder (undifferentiated) (295.9x)
III	Separation Anxiety Disorder (309.21) Overanxious Disorder (313.00) Identity Disorder (313.82) Anorexia Nervosa (307.10)
IV	Attention Deficit Disorder with Hyperactivity (314.01) Attention Deficit Disorder without Hyperactivity (314.00)
V	Avoidant Disorder (313.21) Schizoid Disorder (313.22) Elective Mutism (313.23)
VI	Major Depression (296.2x)
	[Oppositional Disorder (313.81)]

The empirical clustering of symptom rating scale profiles produced a classification of disorders that generally corresponds to the major diagnostic groupings in DSM-III. The diagnostic clusters share enough of the total range of symptom manifestations to have highly similar factor score profiles and can be considered on empirical grounds to represent the major syndromes of childhood psychopathology. From the point of view of treatment evaluation, the clusters of specific diagnoses share enough common symptomatology to be evaluated along the same major dimensions.

The one or two discrepancies between the DSM-III classification of childhood diagnoses and the empirical grouping based on similarities of CPRS symptom and behavior rating profiles highlight the distinction between underlying dynamics and descriptions of behavior. For example, the diagnosis avoidant disorder is classified with the anxiety syndromes in DSM-III. The overt behavioral manifestations, however, primarily involve diminished social interaction. Elective mutism represents an extreme example of such behavioral manifestations. The CPRS profile places avoidant disorder with elective mutism and schizoid disorder in recognition of the manifest social withdrawal rather than with the anxiety disorders, even though anxiety may indeed by the underlying basis for the manifest behavior. Regardless of the DSM-III classification, it is apparent that the manifest psychopathology associated with avoidant disorder was considered by these psychiatrists to be represented in rating scale terms along the same primary dimensions that are useful in characterizing other forms of social and behavioral withdrawal. Another interesting difference between the DSM-III classification and this one is that anorexia nervosa and identity disorders are included in the category of anxiety disorders in this grouping. In all other respects the empirical classification based on complete CPRS profile patterns appears consistent with the DSM-III grouping of specific diagnoses into broader categories.

Based on examination of the mean factor score profiles for diagnostic groups in each of the six major clusters, as well as on clinical experience with the syndromes, specific factors are proposed as relevant for evaluation of psychopathology and measurement of treatment response in different diagnostic groups. These are presented in Table 2. For some clusters, one or two factors appear more relevant than the others and are indicated by an asterisk.

*Greater relevance

The purpose of the cluster analysis was not to encourage use of the rating scale for diagnostic purposes. Results from the cluster analysis provide a guide to the CPRS symptom factors that are relevant for evaluation of levels of severity and treatment response in various DSM-III diagnostic groups. One can expect to measure significant improvement only on those major dimensions of psychopathology that are relevant to the particular diagnostic entities being treated.

In summary, factor analysis of the CPRS has been used to identify clinically meaningful factors and cluster analysis to identify six major clusters of DSM-III diagnostic groups. Examination of the results has led to an identification of the factors that are most relevant for characterizing the patients in each of these six diagnostic clusters. It is suggested that a modification of the CPRS based on this factor analysis could facilitate investigating and documenting psychopathology and treatment response in a more efficient manner.

Haloperidol in Autistic Children: Effects on Learning, Behavior, and Abnormal Involuntary Movements[1]

Magda Campbell, M.D.,[2] Lowell T. Anderson, Ph.D.,[2] Ira L. Cohen, Ph.D.,[2] Richard Perry, M.D.,[2] Arthur M. Small, M.D.,[2] Wayne H. Green, M.D.,[2] Lillian Anderson, R.N.,[2] and William H. McCandless, Jr., M.A.[2]

The efficacy of haloperidol as one treatment modality for young autistic children has been supported by the results of our two recently published studies (Campbell, Anderson, & Meier, 1978; Cohen, Campbell, & Posner, 1980). Both trials were double-blind and placebo-controlled, and patients were randomly assigned to treatments.

However, the following questions remained unanswered: 1) how does haloperidol facilitate learning—by directly affecting attentional mechanisms or by reducing withdrawal and stereotypies? 2) what are the long-term therapeutic effects of haloperidol? and 3) what are the possible long-term untoward effects, specifically the effects on neuroleptic-induced abnormal movements?

To answer these questions, a double-blind, placebo-controlled trial of haloperidol in 40 autistic children who met the Diagnostic and Statistical Manual-III (DSM-III) criteria was conducted. A total of 33 subjects ages 2.3 to 7.9 years (mean, 4.7 years) have thus far completed the study.

The children were maintained for 2 weeks on placebo for baseline evaluations. Those suitable were randomly assigned to one of two treatment sequences: haloperidol-placebo-haloperidol or placebo-haloperidol-placebo. Each treatment period lasted 4 weeks.

Discrimination learning, behavioral symptoms, and untoward effects were rated. The ratings of the two child psychiatrists using the Children's Psychiatric Rating Scale (CPRS), Clinical Global Impressions (CGI), Abnormal Involuntary Movement Scale (AIMS), and the Abbreviated Dyskinesia Rating Scale (Simpson, Lee, Zoubok, & Gardos, 1979) were videotaped. The results videotaped were as follows.

The optimal doses of haloperidol ranged from 0.5 mg/day to 3.0 mg/day (mean, 1.12 mg/day). At these doses, serum levels of haloperidol ranged from ND* or 1.30 to 8.30 ng/ml (collaborative study with Drs. Robert Rubin and Russell Poland, Torrance, California).

On these doses, haloperidol was found to be significantly superior to placebo in reducing behavioral symptoms on the CGI and the CPRS; specifically, stereotypies, withdrawal, hyperactivity, abnormal object relations, and fidgetiness were lower on drug ($p < .001$) (Figure 1). The placebo scores were significantly higher than haloperidol scores on the Conners' Parent Teacher Questionnaire (PTQ) ($p < .01$). The Timed Behavioral Rating Sheet revealed that the effects on stereotypies were a function of the structure of the rating conditions; in the unstructured rating, mean stereotypy scores remained high across treatment, while in the structured situation stereotypies decreased on haloperidol relative to placebo.

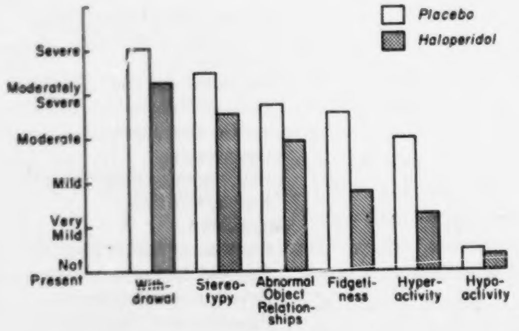

FIGURE 1. Comparison of 33 autistic children receiving placebo vs. haloperidol in terms of their average scores on the Children's Psychiatric Rating Scale. There was a significant difference between groups ($p < .001$) as determined by a matched-pairs signed ranks test, on all items except hypoactivity: children receiving haloperidol were rated to have less severe behavioral symptoms.

***ND = < .05 ng/ml.**

Administration of haloperidol at these doses not only resulted in reduction of behavioral symptoms, but also facilitated learning in the laboratory situation. There, a computer-controlled operant conditioning apparatus was used to present stimuli, record responses, present reinforcers according to a specified schedule, and record durations of stereotypic behavior; motor activity levels were also recorded from pressure sensors mounted under carpeting.

Children were required to learn that reinforcement was available if the lever was pressed during the presentation of an auditory-visual stimulus pattern (S+) and was not available when the stimulus pattern was off (S−). Discrimination indices were computed for each child and the mean across children plotted as a function of sessions and treatments.

The results indicate that children receiving haloperidol learned the discrimination while those on placebo did not (Figure 2). This was by virtue of the haloperidol group displaying fewer responses when the auditory-visual stimulus pattern was off (S−). Children who acquired the discrimination on haloperidol retained it when placed on placebo. Children shifted from placebo to haloperidol showed continued improvements in performance and decelerations in inappropriate responding which were comparable to the children who acquired the discrimination on haloperidol. Developmental level, *per se,* did not interact with drug to determine performance.

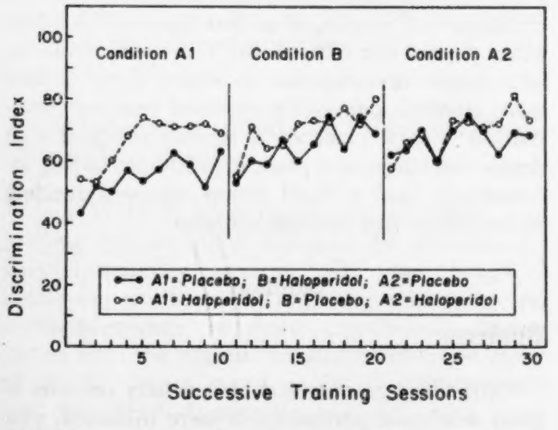

FIGURE 2. Discrimination learning in 22 autistic children during two treatment sequences.

There was no significant effect of medication on stereotypies between the two groups in the laboratory; this suggests that reduction in this symptom is not responsible for the improvement in learning.

The second part of the study was an investigation of long-term effects of haloperidol. If the child responded well to haloperidol during the 12-week trial, he was placed on this drug for an additional 6 months. Children were randomly assigned to one of the two conditions: 5 days of haloperidol and 2 days of placebo (discontinuous treatment), or haloperidol every day of the week (continuous treatment). Every 6 months, haloperidol was discontinued and the child was placed on placebo for 4 weeks. Behavioral ratings on the CPRS and CGI, and ratings on the AIMS and abridged Simpson Scale (Simpson et al., 1979) with videotaping were done at fixed intervals. At the present time, 22 children have been on haloperidol for 6 months, and 11 children for 1 year or more, on doses ranging from 0.5 to 3.0 mg/d.

As for behavioral symptoms, their reduction was maintained at the 6-month followup rating. One week after the discontinuation of haloperidol, ratings of fidgetiness, hyperactivity, stereotypies, withdrawal, and abnormal object relations on the CPRS as well as CGI ratings showed significant increases ($p<.05$, Matched-Pairs Signed Ranks Test).

As for movements, to date four children developed drug-related abnormal movements in this prospective study, as shown in the Table.

In summary, in young children diagnosed as having infantile autism according to DSM-III criteria (axis I), haloperidol, at conservative doses of 0.5 to 3.0 mg/day, yields both clinically and statistically decreases of behavioral symptoms and facilitates learning in our discrimination tasks. This occurs with a bioavailability of ND* or 1.30 to 8.30 ng/ml in serum. On the same dosage, in about 12% of these patients studied prospectively, haloperidol yields worsening of preexisting voluntary abnormal movements or involuntary abnormal movements *de novo;* this occurs while the patient is on drug maintenance (from 3 to 11 months), or as a withdrawal phenomenon. These data were obtained under careful clinical monitoring; drug compliance was excellent.

*ND = <.05 ng/ml

A Controlled Study of Methylphenidate in Combination with Academic Instruction

Rachel Gittelman, Ph.D.[1]

The issue whether stimulants are effective in altering children's learning deficits has been, and continues to be, the subject of much controversy (Dykman, 1980). Gittelman-Klein and Klein (1976) compared methylphenidate with a placebo in 61 children of average intelligence who had significant reading lags and no behavior problems. Methylphenidate was found to improve performance on many psychometric tests, but did not affect performance on standardized reading tests. The pattern of results indicated that performance on tasks which require speed of mental processing was improved by the drug, whereas performance on untimed, complex verbal tasks was not. In a further report (Gittelman, 1980), none of the patient characteristics investigated predicted drug effect, as defined by significant improvement in reading performance.

The results of Gittelman-Klein and Klein (1976) might be interpreted to indicate that attention and learning capacity had been enhanced by methylphenidate, but that, in the absence of concurrent special remedial efforts, the children were unable to profit from their better attentional capacity. These results prompted the investigation of the hypothesis that methylphenidate *in combination* with a program of reading instruction would be superior to reading remediation alone in children with reading disorders uncomplicated by other psychiatric difficulties. This study was part of a larger investigation in which three groups were studied: one group received reading remediation with a placebo; a second received academic tutoring and a placebo (without reading instruction); and a third group received reading remediation and methylphenidate.

Method

Subjects

Only children referred by teachers because of poor academic performance were included, provided they were not judged to have current behavior disorders. All children received reading remediation which which emphasized the teaching of phonic decoding and encoding skills. In addition, children were randomly assigned to either placebo or methylphenidate, and treated in double-blind fashion.

---

[1] New York State Psychiatric Institute New York, NY 10032.

Results

At the end of the 18-week period, the children were receiving an average of 44.19 mg/d of methylphenidate. The range of daily dosage was from 10 to 60 mg. The children's weight ranged from 24.5 to 78.8 kg, and the mean daily dose was 1.19 mg/kg at the end of treatment (range = .41 to 2.23 mg/kg).

Methylphenidate Effects on Reading Achievement

The scores of the Wide Range Achievement Test (WRAT) and Gray Oral at the end of treatment were not significantly different between the two groups.

On a phonetic reading test, significantly superior performance for the methylphenidate-treated children as compared to the placebo group was found on one of the reading tasks. Trends were found on the Reading Age ($p < .10$) and on the reading of Graded Phonically Complex Words ($p < .06$) in favor of the methylphenidate-treated children. Of the four reading tests of the Stanford Achievement Tests, the Language subtest showed a significant advantage for the methylphenidate group ($p < .02$).

Methylphenidate Effects on Academic Tasks Other Than Reading

The WRAT grade levels of arithmetic and spelling did not differ between the placebo and methylphenidate groups. On the Stanford Achievement Test, the children who were on methylphenidate obtained significantly higher scores than the placebo-treated children on three of the four math measures: Math Computation ($p < .04$), Math Application ($p < .005$), and Total Math ($p < .0003$). In addition, the drug-treated group performed significantly better than the placebo group on the Social Studies subtest of the Stanford Achievement Test ($p < .005$).

Long-Term Effects of Methylphenidate Treatment

The long-term effects of the 4 months of treatment with methylphenidate were examined 2 and 8 months after treatment termination. One of the children received medication or tutoring during these intervals. The two treatment groups obtained indistinguishable scores at both followup points.

Discussion

The inference may be drawn that, among children who receive individual reading assistance consisting of phonetic remediation, the addition of methylphenidate in the doses used induces significant advantages in academic tasks other than reading. The failure to find long-term advantages for the methylphenidate-treated children, when drug effects had been obtained during treatment, suggests that stimulants may not enhance learning. Rather, they may be viewed as improving performance. In contrast with other reports (Swanson & Kinsbourne, 1976), no evidence for state-dependent learning was obtained. Our results indicate that, even at relatively high doses, performance can be significantly improved by methylphenidate. High dosage does not compromise learning (Sprague & Sleator, 1977); whether more drug effects would have been obtained with less medication cannot be addressed.

Methylphenidate in Adults with Minimal Brain Dysfunction Symptomatology

Jeffrey A. Mattes, M.D.,[1] Lane Boswell, B.A., [2] and Herman Oliver, M.D.[2]

The fate of children with minimal brain dysfunction (MBD) is uncertain. Until recently, it was believed that children outgrow the symptoms of MBD around the time of puberty (Eisenberg, 1966). Recent studies, however, indicate that the outcome of children with MBD is not universally positive. Family (Cantwell, 1975) and followup (Weiss, Minde, Werry, et al., 1971) studies suggest that hyperactive children are at risk for behavioral difficulties, including alcoholism and sociopathy, past puberty; though the symptom of hyperactivity may decrease, distractibility, impulsivity, excitability, low self-esteem, poor academic achievement, and interpersonal difficulties may continue into later life. There are also preliminary data suggesting that stimulant medication may be effective in adult conditions possibly related to childhood MBD (Wood, Reimherr, Wender, & Johnson, 1976; Wender, Reimherr, & Wood, 1981). However, these studies did not include a control group, and so were not able to determine the specificity of drug effect.

The objectives of this study were to evaluate whether methylphenidate (Ritalin), a standard treatment for childhood MBD, is effective in adults with symptoms considered related to MBD, and to evaluate the specificity of drug response. The overall goal was to determine if MBD is a specific diagnostic entity in adulthood with a specific treatment, stimulant medication.

Method

All patients applying to an adult psychiatric outpatient clinic (approximately 3,000 patients during the course of this study) were screened by questionnaires and (for eligible patients) interviewed to determine eligibility. Two groups of patients were identified:

1) an experimental patient group with adult symptoms of MBD (restlessness, poor concentration, emotional lability, and impulsivity) and retrospective diagnoses of childhood MBD (more specifically, MBD with hyperactive symtomatology), and
2) a control group with similar adult symptoms but with no childhood histories of MBD (this controlled for the possibility that methylphenidate is helpful for certain adult symptoms regardless of childhood history).

It was assumed that the control group would manifest adult MBD-like symptomatology as a result of anxiety or depression; however, severe depressives (major depressive episodes of greater than mild severity), schizophrenics, and manic depressives were excluded. All patients were entered into a double-blind, crossover design, and given 3-week trials of methylphenidate (up to 60 mg/day; the actual mean dosage was 48 mg/d) and placebo.

Baseline evaluation included ratings by patients, psychiatrists, and significant others, on MBD-related and other symptomatology. In addition, old school records were obtained, and parents were asked to retrospectively rate the patient's childhood MBD symptomatology. Evaluation of drug effect included ratings by patients, psychiatrists, and significant others.

Results

Final results, with an *N* of 63 (approximately 30 in each group) are as follows:

The Diagnostic and Statistical Manual-III (DSM-III) diagnoses of the two groups did not differ significantly except, as expected, that the experimental group much more frequently met the criteria for attention deficit disorder, residual type. The most common diagnoses were major depressive disorder (mild in severity; $N = 19$), alcohol abuse ($N = 17$), drug abuse ($N = 16$), borderline personality disorder ($N = 16$), generalized anxiety disorder ($N = 7$), and antisocial personality disorder ($N = 5$).

A number of baseline measures differentiated the two groups. The experimental group (with childhood hyperactivity) began drinking heavily at an earlier age (if they drank heavily), had histories of more drug abuse, had missed more time from work, had more conflicts with others, had more childhood antisocial symptoms, and did worse on the aphasia test and the tactual perception test. These differences were in the expected direction and indicate that we were successful in identifying relatively distinct groups.

---

[1] Bronx VA Medical Center, Bronx, NY 10468.

[2] Long Island Jewish-Hillside Medical Center, Glen Oaks, NY 11004.

Unfortunately, however, the groups did not differ in response to medication (the principal analyses were 4-way analyses of variance: Drug x Group x Order x Sex). There was no evidence of overall benefit from methylphenidate in either group, and no tendency for the experimental group to respond better than the control group.

Attempts to identify predictors of drug response were generally unsuccessful. Correlations between the baseline measures and improvement on methylphenidate were, for the most part, nonsignificant; of the few significant correlations with greater improvement, some were in the expected direction (e.g., more drug abuse and more childhood vandalism), but others were in the opposite-than-expected direction (e.g., less temper outbursts and less retrospective parent-rated childhood hyperactivity). Analyses comparing "Improvers" on methylphenidate vs. "Non-Improvers" were also generally unsuccessful in identifying predictors of drug response. In particular, retrospective parent ratings of childhood hyperactivity, reported by Wender et al. (1981), to predict stimulant responsiveness did not predict response in our sample. History of drug abuse (polydrug) was the best predictor of positive methylphenidate response.

Despite these generally negative results, we were impressed that a few patients (about 10 in the total sample) did appear to obtain clinically meaningful benefit from the methylphenidate (but not from placebo); these patients were as likely to come from the control group as from the experimental group. For these patients methylphenidate was recommended clinically following this study, and several of these patients followed this recommendation and continued to benefit from methylphenidate (periodic trials off medication confirmed this benefit). The response to methylphenidate in some of these cases was as dramatic as in the case histories reported by Wood et al. (1976) and Wender et al. (1981).

Discussion

This study failed to find evidence of methylphenidate response among adults with symptomatology suggestive of MBD. No baseline measure, including history of childhood MBD, predicted methylphenidate response. The clinical evidence of response in certain patients was not evident statistically, and is therefore basically anecdotal. It appears that further work should be done to identify predictors of stimulant response among adults with MBD symptomatology.

Vol. 17, No. 1, January 1981

Page

Research Reorganization within the National Institute of Mental Health 1
International News 2
Publication Announcements 3
Evaluation of Drug Efficacy in Dementia: A Computerized Cognitive Assessment System—*Roland J. Branconnier, Donald DeVitt, and Jonathan O. Cole* 4

Eighteenth Annual Meeting of the ACNP—Abridged Proceedings—

Neuroendocrine Studies of Depressive Disorders—

Vasopressin Function in Depression and Mania—*Philip W. Gold, Frederick K. Goodwin, Robert M. Post, and Gary L. Robertson* 7
Neuroendocrinology of Depression—A Discussion—*Gregory M. Brown, Eva Grof, and Paul Grof* 10

Serotonin: Twenty-Five Years Later—

Monoamine Theories of Sleep: The Role of Serotonin—A Review—*Peter J. Morgane* 13
Studies on the Role of Serotonin in Avoidance Learning—*Sven-Ove Ögren* 17
Changes in 5-Hydroxytryptamine and its Metabolites in Neuropsychiatric Disorders—*Merton Sandler* 19

Investigational Antidepressant Drugs: Implications for Future Research and Treatment of the Affective Illnesses—

Novel Antidepressants: A Clinical Trial of Mianserin—*Patrick J. McGrath, Frederick J. Quitkin, Jonathan W. Stewart, Michael Liebowitz, Abby Fyer, Sharon Davies, and Donald F. Klein* 21
Clinical Trials with New Bicyclic and Tetracyclic Compounds: Zimelidine and Maprotiline—*James L. Claghorn and Roy J. Mathew* 23
Crossover Study of Zimelidine and Desipramine in Depression: Evidence for Amine Specificity—*William Z. Potter, Helene M. Calil, Irl Extein, Giovanni Muscettola, and Frederick K. Goodwin* 26
Methadone and Morphine in Depression—*Irl Extein, David Pickar, Mark S. Gold, Philip W. Gold, A.L.C. Pottash, Donald S. Sweeney, Richard J. Ross, Robert Rebard, David Martin, and Frederick K. Goodwin* 29
Second Generation Antidepressants: A Clinical Pharmacotherapeutic Research Strategy—*Baron Shopsin* 33

Page

Behavioral Interventions and Pharmacological Treatments in Schizophrenia: Differential Indications and Strategies for Future Research—

Natural and Therapeutic Environmental Indicators of Maintenance Dosage Requirements—*Gerard E. Hogarty* . . . 36

Assessment of Drug Scheduling—

Use of Currently Available Data Sources to Assess Drug Scheduling—*Charles W. Gorodetzky* . . . 38
Guidelines for Scheduling Drugs Under the Controlled Substances Act—*Ronald Kartzinel* . . . 40
Discussion of Presentation by Dr. Kartzinel—*Richard Dorsey* . . . 42
Impact of Drug Scheduling on Utilization—*John M. Holt* . . . 43

Aspects of Tardive Dyskinesia—

Animal Models of Tardive Dyskinesia—*Arnold B. Davidson* . . . 45
Preliminary Findings with Regard to Risk Factors in the Development of Tardive Dyskinesia—*John Kane, Frederick Struve, Margaret Woerner, and Paul Weinhold* . . . 46
Dopaminergic and GABAergic Aspects of Tardive Dyskinesia—*Daniel E. Casey, Jes Gerlach, Gerhard Magelund, and Torben Rosted Christensen* . . . 49

Supersensitivity and the Dependent State—

The Relationship Between the Acute Behavioral Effects of Narcotic Antagonists and the Narcotic-Dependent State—*Rita J. Valentino, Seymore Herling, and James H. Woods* . . . 51
Supersensitivity to the Behavioral Effects of Opiate Antagonists—*Roger D. Spealman, Roger T. Kelleher, William H. Morse, and Steven R. Goldberg* . . . 54
A Reformulation of the Dual-Action Model of Opioid Dependence: Opioid-Specific Neuronal Kindling—*Julian E. Villarreal and Antonio Castro* . . . 56

Neurochemical Correlates of Aggressive Behavior—

Drug Regimens Facilitating Aggression: Behavior, Amine, and Receptor Alterations—*Burr Eichelman* . . . 58
Pharmacological Evidence for Catecholamine Involvement in Animal Aggression—*Klaus A. Miczek* . . . 60
Discussion of Paper by Dr. Klaus Miczek—*William T. McKinney, Jr.* . . . 62
Cerebrospinal Fluid Amine Metabolites and Cyclic Nucleotides in Human Aggression—*Gerald L. Brown, Frederick K. Goodwin, James C. Ballenger, and Peter F. Goyer* . . . 63

The Psychobiology of Depression: Report of the National Institute of Mental Health Collaborative Study—Biological Component—

Introduction—Overview of the Study—*Stephen H. Koslow and Steven Secunda* . . . 65
Diagnostic Assessments and Relationships to Outcome—*Jack Croughan, James Kocsis, and Alan Ramsey* . . . 68
Behavioral Aspects and Relationships to Outcome—*Martin M. Katz, Robert Shulman, and Eli Robins* . . . 69
Pretreatment Amine Neurotransmitter System Interrelationships in Depression—*Charles L. Bowden, D. Eugene Redmond, Alan Swann, and James W. Maas* . . . 70
Unexpected Neuroendocrine-Transmitter Relationships—*Peter E. Stokes, Alan Frazer, and Regina Casper* . . . 72

Schizoaffective Disease and Atypical Psychosis—

The Pharmacological Treatment of Schizoaffective Disorder-Depressed: A Review of the Literature—*Duane G. Spiker* . . . 75
Genetic Nature of Schizoaffective Disorder—*Diane K. Wagener* . . . 79

L-Tryptophan in Psychiatry and Neurology—

Daytime Effects of L-Tryptophan—*Cheryl L. Spinweber* . . . 81

Psychopharmacology of Opiate Agonist-Antagonist Drugs—

Structure Activity and Receptor Binding of Antagonist Analgesics—*John William Lewis and Michael John Rance* . . . 83

Page
Clinical Pharmacology of Mixed Agonist-Antagonist Drugs—*Donald R. Jasinski* 85

Poster Session—

Plasma and CSF MHPG in Normals—*David C. Jimerson, James C. Ballenger, C. Raymond Lake, Robert M. Post, Frederick K. Goodwin, and Irwin J. Kopin* 86

Annual NCDEU Meeting (1980)—Abridged Proceedings—

Biological Strategies in Clinical Psychopharmacology Research—

The Dexamethasone Suppression Test in the Identification of Subtypes of Depression Differentially Responsive to Antidepressants—*Walter Armin Brown, Richard J. Haier, and C. Brandon Qualls* 88
Possible Pathophysiological Mechanisms in Subtypes of Unipolar Depressive Disorders Based on Differences in Urinary MHPG Levels—*Joseph J. Schildkraut, Paul J. Orsulak, Alan F. Schatzberg, Jonathan O. Cole, and Alan H. Rosenbaum* 90
Repeated Antidepressant Treatments Induce a Long-Lasting Dopamine Autoreceptor Subsensitivity: Is Daily Treatment Necessary for Clinical Efficacy?—*Seymour M. Antelman and Louis A. Chiodo* 92

Psychiatric Symptom and Cognitive Test Measures as Aids in Differential Diagnosis of Geriatric Patients—

DSM-III Differential Diagnosis in the Elderly—*Andrew E. Skodol and Robert L. Spitzer* 94
Psychiatric Symptoms in the Elderly—*Allen Raskin and Donald S. Rae* 96
The Relationship Between Psychiatric Assessments and Cognitive Test Measures in Mild to Moderately Cognitively Impaired Elderly—*Barry Reisberg, Steven H. Ferris, Michael K. Schneck, Mony de Leon, Thomas H. Crook, and Samuel Gershon* 99

Monoamine Oxidase and Monoamine Oxidase Inhibitors—

Nongenetic Factors Affecting Human Platelet Monoamine Oxidase—*Arnold J. Friedhoff and Jeanette C. Miller* 101
Platelet Monoamine Oxidase in an Aged General Population and Elderly Chronic Schizophrenics—*T. Peter Bridge, Dilip V. Jeste, C. David Wise, Steven G. Potkin, Bruce H. Phelps, and Richard Jed Wyatt* 103
Effects of Phenelzine and Amitriptyline on Depression—*Eugene S. Paykel, Peter R. Rowan, and Robert R. Parker* 104
The Benefits and Risks of Combining an MAO Inhibitor and a Tricyclic Antidepressant—*Kerrin White* 106

Childhood Depression and Hyperkinesis—

Hyperactives as Young Adults: Past and Current Antisocial Behavior (Stealing, Drug Abuse) and Moral Development—*Lily Hechtman, Gabrielle Weiss, and Terrye Perlman* 107

Free Communications—Session A—

Discrimination of Functionally Heterogeneous Receptor Subpopulations: Antipsychotic and Antidopaminergic Properties of Metaclopramide—*John Rotrosen, Michael Stanley, Andrew Lautin, David Wazer, and Samuel Gershon* 110
Plasma Levels of Chlorpromazine and Clinical Response—*Theodore van Putten, Philip R. A. May, and Donald J. Jenden* 113
The Effects of a Drug Holiday on Relapse and Tardive Dyskinesia in Chronic Schizophrenics—*Solomon C. Goldberg, Ram S. Shenoy, Anne Sadler, Robert Hamer, and Beverly Ross* 116
Effects of Gradual Decrease and Discontinuation of Neuroleptics on Clinical Condition and Tardive Dyskinesia—*Marc H. Branchey, Laure B. Branchey, and Mary A. Richardson* 118
Long-Term Changes in AIMS Ratings and Their Relation to Medication History—*James M. Smith, Mary P. Burke, and Cheung O. Moon* 120
Analysis of Single-and Double-Blind Procedure, Maintenance of Placebo Effects, and Drug-Induced Dyskinesia with Mentally Retarded Patients—A Brief Report—*Stephen E. Breuning, Donald G. Ferguson, and Salvatore Cullari* 122

Page

Effects of Lithium Carbonate and Haloperidol on Cognition in Aggressive, Hospitalized School Age Children—*Jane E. Platt, Magda Campbell, and Ira L. Cohen* 123

Molindone Hydrochloride in the Treatment of Aggressive, Hospitalized Children—*Lawrence L. Greenhill, Joseph E. Barmack, David Spalten, Mary Anderson, and Frieda Halpern* 125

The Effects of Lecithin on Memory in Patients with Senile Dementia of the Alzheimer's Type—*George A. Vroulis, Robert C. Smith, Samuel Brinkman, Joseph Schoolar, and Jack Gordon* 127

A Double-Blind, Placebo-Controlled Study of Piracetam in Elderly Psychiatric Patients—*Guy Chouinard, Lawrencs Annable, Andree Ross-Chouinard, Mireille Olivier, and Francine Fontaine* 129

The Therapeutic Profile of Mianserin in Mild Elderly Depressives—*Roland J. Branconnier, Jonathan O. Cole, and Sasan Ghazvinian* 129

Free Communications—Session B—

Predictors of Adolescent Height and Weight in Hyperkinetic Boys Treated with Methylphenidate—*Jan Loney, Mary Anne Whaley-Klahn, Laura Boles Ponto, and Kenneth Adney* 132

Public Judgments on the Importance of Valium Information—*Seymour Fisher and Bruce Mansbridge* 134

Clinical Trial of Halazepam and Clorazepate: Considerations of a Single Bedtime Dose—*Neal L. Cohen, Murray Alpert, and Arnold J. Friedhoff* 134

Evaluation of a Training Program in Using the Research Diagnostic Criteria—*Arthur Rifkin, Gerard Reardon, Samuel Siris, and Jean Endicott* 135

Efficacy of Desipramine in Mildly Depressed Patients: A Double-Blind, Placebo-Controlled Trial—*Jonathan W. Stewart, Frederic Quitkin, Michael R. Liebowitz, Patrick J. McGrath, and Donald F. Klein* 136

Factors which Affect Antidepressant Drug Response in a Multicenter Controlled Trial—*James N. Logue and Barry A. Sachais* 138

Clinical Efficacy of the New Antidepressant Bupropion (Wellbutrin®)—*Angelos E. Halaris, Warren Stern, and Nancy Harto-Truax* 140

Lithium and Imipramine in the Prophylaxis of Unipolar and Bipolar II Depression: A Prospective, Placebo-Controlled Comparison—*Frederic M. Quitkin, John M. Kane, Arthur Rifkin, Jorge R. Ramos-Lorenzi, Kishore Saraf, Alfreda Howard, and Donald F. Klein* 142

Prophylactic Lithium with and without Imipramine for Bipolar I Patients: A Double-Blind Study—*John M. Kane, Frederic M. Quitkin, Arthur Rifkin, Jorge R. Ramos-Lorenzi, Kishore Saraf, Alfreda Howard, and Donald F. Klein* 144

Cumulative Index—Psychopharmacology Bulletin—1980 146

Psychopharmacology—A Recurring Bibliography—

Meeting Announcements 1
Book Reviews 2
Letter to the Editor 8

Adverse Drug Reactions—

Lithium, Leukocytosis, and Leukemia: The Probable Influence of Biologic Plausibility on Clinical Concern—*Paul Leber* 10

Research Center Reports—

Current Research Activities in India—*V.N. Bagadia* 14
Neuropsychopharmacology Research in Psychiatry at Yale University—*Malcolm Bowers, Jr., Michael Stitelman, and Jane Halbing Stitelman* 17

Brief Reports—

Hydergine as a Treatment for Organic Brain Syndrome in Late Life—*Lissy F. Jarvik* 40

Articles—

On the Clinical Response-Serum Level Relationship for Antidepressants I: Amitriptyline—*John E. Dutt* 42
Department of Health and Human Services (DHHS) Regulations Affecting Psychopharmacology Research—*Natalie Reatig* 56
The Nature of Missing Data in a Psychiatric Data Inventory—*Joseph Galdi and Roland Bonato* 66

American Psychological Association Meeting—1980

Recent Perspectives on Placebo Effectiveness—

The Placebo Response in Pain Control—*Frederick J. Evans* 72
Physiological Substrates of Placebo Analgesia—*Newton C. Gordon and Jon D. Levine* 76
Motivational Factors in Placebo Responsivity—*Frederick X. Gibbons and Stefan E. Hormuth* ...

Ethical Issues in Research with Animals—

Experimental Psychology, Animal Rights, Welfare, and Ethics—*Michael W. Fox* 80
Regulating Psychological Experimentation with Animals in the United Kingdom—*Derek E. Blackman* 84
The Use of Animals for Experimentation in the United States—*Jeri A. Sechzer* 88
The Scientist's Concern for Animal Welfare—*Perri M. Adams* 91

Electroencephalography in Drug Research—Scientific Symposium—1980—

Workshop 1: EEG in Clinical Pharmacology—

The Significance of Quantitative Pharmaco-Electroencephalography in Establishing Dose-Time Relations and its Impact on Clinical Pharmacology: Critical Review and Perspectives—*M. Fink* 94
Quantitative Pharmaco-Electroencephalography to Determine Central Nervous System Efficacy or Toxicity of Drugs—*T. M. Itil, D. M. Shapiro, and K. Z. Itil* 94
Evidence for the Potentiating Effect of Two Different Psychotropic Compounds (Cloxazolam and Noveril) by Means of Pharmaco-Electroencephalography and Polarity Profiles—*R. Vollmer, M. Matejcek, K. Knor, and K. Jellinger* 95
Dose-Response Relationships Between Three Benzodiazepines Based on the Vigilosomnogram—*K. Fichte, H. Ott, J. Kugler, and A. Doenicke* 95
Drug-Induced EEG Changes and the Clinical Effects of Zimelidine—*M. Saito, S. Kita, and Y. Kagono* 96
Paradoxical Sleep in Rats as a Pharmacological Test Model—*H. Kleinlogel* 96
Relations Between Pharmacodynamics and Kinetics: EEG and Psychometric Studies with OX 373 and Nomifensine—*B. Saletu, J. Grunberger, K. Taeuber, and V. Nitsche* 97

Page

Performance Tests and Pharmaco-EEG with 1.4-and 1.5-Benzodiazepines—*W. Sitting, M. Badian, and W. Rupp* 97

Lateral Cerebral Differences in Psychotropic Drug Effects—*M. Fink and P. Irwin* 98

Workshop 2: EEG as an Instrument for the Detection and Characterization of Drug Effects on the CNS: Animal and Human Studies—

The Importance of Quantitative EEG in Animals for the Development of Drugs: Critical Review and Perspectives—*G. Stille* 98

The Significance of Quantitative Pharmaco-EEG in the Detection and Classification of Psychotropic Drugs for Humans: Critical Review and Perspectives—*T. M. Itil* 99

The Effect of Clonazepam on the Rabbit's EEG—*H. Petsche, H. Pockberger, P. Rappelsberger, and I. B. Müller-Paschinger* 99

SELAVCO: A New Method to Determine Event-Related Potentials—*T. Gasser, J. Möcks, and R. Verleger* 100

Occurrence Time and Scalp Location of Components of Evoked and Spontaneous EEG Potential Fields—*D. Lehmann and W. Skrandies* 100

Correlated EEG and Evoked Potential Maps with Deoxyglucose Positron Emission Tomography in Schizophrenia—*M.S. Buchsbaum, R. Coppola, and D. Ingvar* 100

Reliability Studies with Quantified EEG Parameters—*G.K. Schenk, W. Filler, W. Ranft, D. Zerbin, D. Dokk, J. Haverkorn, E. Lemke, and R. Windelschmidt* 101

Interpretation of Correlations Between EEG-Power-Spectra and Psychological Performance Variables—*H. Ott, K. Fichte, W.M. Herrmann, and R.J. McDonald* 101

Discrimination Function with EEG and Psychoexperimental Variables for Objective Classification of Psychotropic Substances into a Five-Drug Class System—*W.M. Herrmann, H. Ott, K. Fichte, and St. Kubicki* 102

Critical Flicker—Fusion Frequency, EEG, and Psychoactive Drugs—*M. Fink and P. Irwin* 103

EEG Reactivity to Verbal Material and Quality of Learning—*M. Koukkou, H. Beck, and D. Lehmann* 103

Workshop 3: Effects with Nonclassical Psychotropics—

The Action of Lithium on the EEG of Normal Subjects and Manic-Depressive Patients: Results and Hypotheses—*D. Bente, W. Scheuler, G. Ulrich, and B. Müller-Oerlinghausen* 104

EEG Sleep Patterns and Profiles, and their Modification by Sleep Drugs in Volunteers and Sleep-Disturbed Patients: Critical Review and Perspectives—*St. Kubicki, W.M. Herrmann, H. Ott, and L. Holler* 104

An Appraisal of Age-Related Changes in the Human EEG: Derived Hypotheses and Implications for Drug Research in the Light of Experimental Evidence—*M. Matejcek* 105

EEG Profile of Mepindolol Sulfate as Compared to Diazepam and Placebo—*H. Kunkel and H. Mock* 106

Beta Blockers and EEG: A Quantitative Study with Mepindolol and Propanolol in Normal Subjects—*D. Bente, B. Berzewski, and W.H. Herrmann* 107

Opiates, Opiate Antagonists, Endorphins, and the Somatosensory-Evoked Potentials—*M.S. Buchsbaum, G.C. Davis, D. Nabor, and D. Rey* 107

EEG Spectral Analysis of Met-5-Enkephalin Effects on the Rabbit Brain—*G. Rosadini, F. Ferrillo, V. Montano, and G. Rodriguez* 108

EEG Changes During Long-Term Lithium Treatment of 6 to 10 Years—*R. Kocher and M. Gastpar* 108

First Effects of Yohimbine on EEG, Quantified by Fourier Spectral Analysis—*P. Etevenon, B. Pidoux, Y. Lecrubier, P. Peron-Magnan, and G. Verdeaux* 108

Psychopharmacology—A Recurring Bibliography—

Foundations' Fund Prize for Research in Psychiatry 1
Meeting Announcements 2
Book Reviews 3
Book Announcements 5

Adverse Drug Reactions—

Sudden Death as a Risk of Neuroleptic Treatment: (A Continuing Controversy)—*Paul Leber* 6

Brief Report—

A Synopsis of the Status of the New Antidepressant—*Robert F. Prien* 10

Report from a WHO Collaborative Reference Center for the Study of Psychotropic Drugs—

Current Psychopharmacological Research Activities of the WHO Center in Italy—*C.L. Cazzullo* 12

Nineteenth Annual Meeting of the ACNP—Abridged Proceedings—

Bioequivalency of Psychotropic Agents—

Suitable Analytical Methods for Bioequivalence of Antipsychotic Drugs—*Kamal K. Midha, John K. Cooper, Edward M. Hawes, John W. Hubbard, Richard M.H. Roscoe, H. Umesha Shetty, and Pollen K.F. Yeung* 15
CNS Effects of Clonidine in Normal Volunteers—*Max Fink and Peter Irwin* 16
What Is So Different About Bioequivalency of Psychotropic Drugs?—*Louis A. Gottschalk* 17

Sleep and Neuroendocrine Abnormalities in Affective Disorders: New Findings—

EEG Studies of Sleep and the Dexamethasone Suppression Test in the Diagnosis of Depression—*Michael Feinberg, J. Christian Gillin, Bernard J. Carroll, John F. Greden, and Athanasios P. Zis* 20
Sleep EEG and Dexamethasone Suppression Testing Findings in Unipolar Depressions—*A. John Rush, Howard P. Roffwarg, Donna E. Giles, and C Richard Parker* 22

Neuropsychopharmacology of Clonidine—Preclinical Aspects—

Studies on Clonidine in Animal Tests for Antianxiety Activity—*Jerry Sepinwall and Leonard Cook* 24

Platelet Monoamine Oxidase Activity in Schizophrenia—

Effect of Neuroleptic Drugs on Platelet Monoamine Oxidase Activity—*Herbert Y. Meltzer, Herbert Jackman, Ramesh C. Arora, Suman Sahai, and Marybeth Duncavage* 26
Effects of Oxygen, pH, and Toluene on the Activity of Platelet MAO Obtained from Healthy and Chronic Schizophrenic Individuals—*Wolfgang H. Vogel, Mina T. Gentile, Wade H. Berrettini, Kenneth J. Weiss, and Thomas C. Benfield* 28

Neurochemical Modulation of Sensory Motor Reflexes—

Some Recent Observations on the Organization of the Mammalian Spinal Cord—*M. David Egger* 31
Neurochemical Modulation of the Acoustic Startel Reflex—*Michael Davis* 33
Pharmacologic Studies of the Hoffman Reflex Recovery Curve in Humans—*John Metz and Herbert Y. Meltzer* 34
Neurophysiologic Testing from the Laboratory to the Clinic—*Charles Shagass* 35

Biological and/or Genetic Factors in Alcoholism—

Biological Risk Factor Assessment in Lithium Treatment of Alcoholism—*John L. Sullivan, Paula D. Sullivan, Jonathan Davidson, Allan A. Maltbie, Steve Mahorney, Ronald J. Taska, and Jesse O. Cavenar* 37
Path Analysis of Multifactorial Segregation Distributions: Current Work and Future Directions—*John Rice, Theodore Reich, and C.R. Cloninger* 40

Page

Phenolsulfotransferase—

Evidence for Multiple Forms of Human Phenolsulfotransferase—*Glen Rein, Vivette Glover, and Merton Sandler* 43
Sulfoconjugation of Monoamines in Human Platelets—*Giovanni B. Picotti, Andrea M. Cesura, Rolf Kettler, and Mosé Da Prada* 45
Human Platelet Phenolsulfotransferase (PST)—*Godfried M.J. van Kempen and Ed J.M. Pennings* 46
Characterization of Human Brain Phenosulfotransferase—*Jerome A. Roth, A. Jennifer Rivett, and Kevin J. Renskers* 48
Phenolsulfotransferase: Purification and Characterization of the Rat Brain Enzyme—*Anna Baranczyk-Kuzma, Ronald T. Borchardt, Charles S. Schasteen, and Carol L. Pinnick* 50
Clinical Studies on Platelet Phenolsulfotransferase—*Merton Sandler, Vivette Glover, Susan M. Bonham Carter, Julia Littlewood, and Glen Rein* 51

Neurochemistry of Brainstem Functions—

Thirst Induced by Angiotensin II Analyzed Pharmacologically—*M. Ian Phillips, Arturo Camacho, and Colin Sumners* 53
Neurochemistry of Motivated Behavior—*Matthew J. Wayner and Frank C. Barone* 56
Brain Catecholamine Projections: Their Function in Control of Spontaneous and Drug-Induced Changes in Feeding Behavior, Appetite, and Body Weight—*Sarah Fryer Leibowitz* 59
Neurochemistry of Thermoregulation—*Robert D. Myers* 62
Monoaminergic and Peptidergic Control of Gonadotropin Secretion—*Samuel M. McCann* . . 66
Multifactorial and Multitransmitter Basis of Behaviors, and Their Cholinergic Concomitants—*Alexander Karczmar* 68

Endorphins and Enkephalins—

Studies Related to the Metabolic Processing of Endogenous Opioids—*Jack D. Barchas, Sue Sullivan, Huda Akil, Michael Boarder, Eckard Weber, and William C. Hewlett* 70
Potentiation by Leucine Enkephalin of Narcotic Effects in vitro and in vivo—*Akira E. Takemori, Jeffry L. Vaught, Takafumi Kitano, and Alice A. Larson* 73
Endorphins in Shock and Spinal Injury: Therapeutic Role for Opiate Antagonists—*John W. Holaday and Alan I. Faden* 74
Cerebrospinal Fluid Endorphins in Psychiatric Patients—*David Pickar, Dieter Naber, Robert M. Post, Daniel P. van Kammen, James Ballenger, Robert M. Cohen, David Rubinow, Robert N. Waters, Frederick K. Goodwin, and William E. Bunney, Jr.* 76

Genetics of Affective Disorders: New Data and Methods—

The Iowa 500: Family Studies of Bipolar and Unipolar Affective Disorders—*George Winokur, Ming T. Tsuang, and Raymond R. Crowe* 78
Dextroamphetamine and Arecoline as Pharmacogenetic Probes in Normals and Remitted Bipolar Patients—*John I. Nurnberger, Elliot S. Gershon, Natraj Sitaram, J. Christian Gillin, Gregory Brown, Michael Ebert, Philip Gold, David Jimerson, and Linda Kessler* 80
The Behavioral and Mood Response to d-Amphetamine: Some Possible Physiological Correlates—*Uriel Halbreich, Gregory M. Asnis, Donald Ross, and Jean Endicott* 83
Platelet Monoamine Oxidase Activity and Lithium Transport in Families of Bipolar Patients—*Ghanshyam N. Pandey, Elizabeth Dorus, Rita Shaughnessy, and John M. Davis* 85

Drug Treatment and Family Intervention During the Aftercare Treatment of Schizophrenics—

The Effects of Family Therapy on Treatment Compliance in Schizophrenia—*John S. Strang, Ian R. H. Falloon, Howard B. Moss, Javad Razani, and Jeffrey L. Boyd* 87
Keeping the Patient Well: Drug and Social Treatments of Schizophrenic Patients—*Ruth Berkowitz, Liz Kuipers, and Julian Leff* 89

Pharmacotherapy of Anxiety and Depression—

Pharmacotherapy of Anxiety and Depression: Rationale and Study Design—*Ronald S. Lipman, Lino Covi, Robert W. Downing, Seymour Fisher, Richard J. Kahn, Douglas M. McNair,*

Page

Karl Rickels, and Virginia K. Smith ... 91

Description of Sample, Comparison of Anxious and Depressed Groups, and Attrition Rates—*Robert W. Downing, Karl Rickels, Douglas M. McNair, Ronald S. Lipman, Richard J. Kahn, Seymour Fisher, Lino Covi, and Virginia K. Smith* ... 94

Effects of Psychotropic Agents on High Anxiety Subjects—*Richard J. Kahn, Douglas M. McNair, Lino Covi, Robert W. Downing, Seymour Fisher, Ronald S. Lipman, Karl Rickels, and Virginia K. Smith* ... 97

Effects of Psychotropic Agents on Primary Depression—*Lino Covi, Karl Rickels, Ronald S. Lipman, Douglas M. McNair, Virginia K. Smith, Robert Downing, Richard Kahn, and Seymour Fisher* ... 100

Teaching Clinical Psychopharmacology—

Teaching Psychopharmacology to Medical Students—*James S. Eaton, Jr.* ... 103

Methods for Evaluating Effects of Opioid Peptides in Laboratory Animals—

Analgesic Testing of Opioid Peptides—*Robert C. A. Frederickson, Edward L. Smithwick, Robert Shuman, and Paul D. Gesellchen* ... 106

Multiple Opiate Receptors and in vitro Methodology for Opioid Peptides—*Kwen-Jen Chang* ... 108

Chronobiology in Psychiatry—

Chronopsychopharmacology—*Ross J. Baldessarini, Alexander Campbell, Joseph Madsen, Michael Herschel, Seth Finkelstein, James M. Smith, Ronald Majocha, and George Arana* ... 112

Studies of Cortisol Diurnal Rhythm and Cortisol Response to d-Amphetamine in Depressive Patients—*Uriel Halbreich, Edward J. Sachar, Gregory M. Asnis, R. Swami Nathan, and Frieda Halpern* ... 114

Neuropsychopharmacology of Clonidine—Clinial Studies—

Neurochemical Studies of Tourette's Syndrome and the Effects of Clonidine—*Donald J. Cohen, J. Gerald Young, Jill Detlor, James F. Leckman, Diane Harcherik, and Bennett A. Shaywitz* ... 116

Pharmaco-EEG and Bioequivalence—A Practical Methodology for Psychoactive Drugs—*Max Fink* ... 120

Clonidine Treatment of Panic Disorder—*Michael R. Liebowitz, Abby J. Fyer, Patrick McGrath, and Donald F. Klein* ... 122

Response to Clonidine in Korsakoff's Disease: Significance and Implications for Future Research—*William J. McEntee, Robert G. Mair, Robert J. Zatorre, and Philip J. Langlais* ... 123

Clonidine: Effects on Mood, Anxiety, and Pain—*Thomas W. Uhde, Robert M. Post, Larry Siever, Monte S. Buchsbaum, David C. Jimerson, Edward K. Silberman, Dennis Murphy, and William E. Bunney, Jr.* ... 125

Clonidine Versus Methadone for Opiate Detoxification—*Arnold M. Washton and Richard B. Resnick* ... 127

The Cholinergic System in Neuropsychiatry—

Tolerance to Cholinergic Agents—*Roger W. Russell* ... 128

Cholinergic Supersensitivity in Affect Disorder Patients: Behavioral and Neuroendocrine Observations—*David S. Janowsky, Samuel C. Risch, Lewis L. Judd, Leighton Y. Huey, and Donal C. Parker* ... 129

Cholinergic-Endogenous Opioid Mechanisms in Mood and Cognition in Man—*Samuel C. Risch, David S. Janowsky, Ned H. Kalin, Robert M. Cohen, and Dennis L. Murphy* ... 132

Methods for Assessing the Abuse Potential of Psychotropic Drugs in Humans—

Abuse Liability: Testing in Humans—*Donald R. Jasinski* ... 137

Human Self-Administration of Sedative and Stimulant Drugs—*Roland R. Griffiths and George E. Bigelow* ... 138

Geriatric Neuropsychopharmacology—

Cholinomimetics and the Treatment of Memory Disorders—*Kenneth L. Davis, Richard C. Mohs, Bonnie M. Davis, Michael Levy, Gordon S. Rosenberg, Thomas B. Horvath, Alison Ross,*

Page

and Allen Rothpearl 141

Neuropeptides, Psychopathology, and Behavior—

Studies Related to the Clinical Use of Opioid Agonists and Antagonists—*Jack D. Barchas, Philip A. Berger, Stanley J. Watson, Huda Akil, Steven Maier, and John Madden, IV* 142
Similarities and Differences in the Effects of Centrally Administered Neurotensin and Neuroleptics—*Charles B. Nemeroff, Arthur J. Prange, Jr., Daniel Luttinger, Daniel E. Hernandez, Richard A. King, and Susan K. Burgess* 145
Neuroleptic-Like Activity of Des-Tyrosine-γEndolphin (β-LPH$_{62-77}$): Possible Mediation by an Active Metabolite, β-LPH$_{66-77}$—*Norman W. Pedigo, Hans Schoemaker, Paul Ragan, Eric S. Berens, Nicholas C. Ling, and Henry I. Yamamura* 147

Impact of Perinatal Environment of Neural Function—

The Sympathetic Nervous System as a Model for Studying Drug-Induced Alterations of Nerve Development—*Theodore A. Slotkin, Jorge Bartolome, Randy Deskin, Christopher Lau, Elliott Mills, and Peter G. Smith* 151

MAO Inhibitors, New Biochemical and Clinical Findings—

Phenelzine Plasma Levels, Pharmacokinetics, and Clinical Outcome—*Donald S. Robinson, Alexander Nies, John Corcella, and Thomas B. Cooper* 154
Tranylcypromine—*Kerrin L. White* 157
Phenelzine and Imipramine in Atypical Depression—*Michael R. Liebowitz, Frederick M. Quitkin, Jonathan W. Stewart, Patrick J. McGrath, Wilma Harrison, David Schwartz, Judith Rabkin, Elaine Tricamo, and Donald F. Klein* 159

Conditioned Drug Effects: Implications for Neuropsychopharmacology—

Conditioned Behavioral and Biochemical Effects of Amphetamine, Apomorphine, Haloperidol, and Droperidol—*Stanley R. Schiff, Wagner H. Bridger, Nansie S. Sharpless, and Carol Barboni* 162
Context-Dependent Cocaine Sensitization: Role of Vasopressin—*Robert M. Post, Nancy R. Contel, and Philip W. Gold* 164
Conditional Drug Responses and Drug Tolerance—*Shepard Siegel* 166

Clinical Psychoneuroendocrinology: An Update—

Prolactin Secretion: An Update—*Herbert Y. Meltzer, D.A. Busch, Alan Robertson, Betty Jo Tricou, and Victor S. Fang* 168
Thyrotropin (TSH) Response to Thyrotropin-Releasing Hormone (TRH) in Psychiatric Patients—*Peter T. Loosen* 171

Patient Package Inserts: Dogma and Data—

Preliminary Findings on the Effects of a Patient Package Insert for Valium—*Bruce Mansbridge and Seymour Fisher* 173

Poster Sessions—

Effect of Duration of Lithium Therapy of Various Psychiatric Patients on Red Blood Cell/Plasma Choline Ratio—*Edward F. Domino, Abdul Riaz, Ernst Rodin, Sandra Demetriou, Benjamin Mathews, and Sandra Tait* 174
Fluphenazine Pharmacokinetics and Therapeutic Response—*Maurice W. Dysken, Javaid I. Javaid, Sidney S. Chang, Agha Shahid, Regina Casper, and John M. Davis* 176
Relationship of TRH Test and Dexamethasone Suppression Test Abnormalities in Unipolar Depression—*Irl Extein, A.L.C. Pottash, Mark S. Gold, and Frederick K. Goodwin* ... 177
A Double-Blind, Placebo-Controlled Study of Zimelidine in Depression—*Anastase Georgotas* 178
A Double-Blind, Controlled Trial of Lithium Carbonate in Primary Anorexia Nervosa—*Howard A. Gross, Michael H. Ebert, Solomon C. Goldberg, Vivian B. Faden, Linda E. Nee, and Walter H. Kaye* 179
8-Hydroxy-2-(Dl-n-Propylamino)Tetralin: Central 5-HT-Receptor Stimulating Activity—*Stephan Hjorth, Arvid Carlsson, Per Lindberg, Domingo Sanchez, Håkan Wikström, Lars-Erik*

Page

Arvidsson, Uli Hacksel, and J. Lars G. Nilsson 180

Effects of Methylphenidate on Interpersonal Perceptions—*David S. Janowsky, Paul L. Clopton, Leighton Huey, and Lewis L. Judd* 183

Independent Regulation of Haloperidol-Induced Behavioral Supersensitivity and Biochemical Tolerance—*Emanuel Meller, Arnold J. Friedhoff, and Eitan Friedman* 187

Stress Effects on β-Endorphin and Opioid Activity in Human Plasma: Relationships to Psychophysiological and Psychological Variables—*Dieter Naber, Monika Bullinger, Ted Zahn, Jeannette L. Johnson, Paiivi Huhtaniemi, David Pickar, Martin R. Cohen, and William E. Bunney, Jr* 187

Evaluation of Saliva Samples for Pharmacokinetic Studies and Steady-State Levels of Tricyclic Antidepressants—*N. Narasimhachari and Robert O. Friedel* 190

Amphetamine Increases Prolactin but Neither Growth Hormone nor Beta-Endorphin Immunoreactivity in Schizophrenic Patients—*S. Charles Schulz, Daniel P. van Kammen, Alan D. Rogol, Michael Ebert, David Pickar, Martin R. Cohen, and Dieter Naber* 193

Carcinogenicity of Hydantoins: Data, Hypotheses, and Public Reviews—*Barrett Scoville and Billy G. White* 195

Repeated Administration of Drugs Known to Inhibit the Activity of Serotonergic Neurons Potentiates the Prolactin-Releasing Effect of Serotonin Agonists—*Miljana Simonovic, Victor S. Fang, and Herbert Y. Meltzer* 198

Pharmacological Treatment of Delusional Depressives—*Duane G. Spiker, Israel Hanin, June E. Cofsky, John F. Neil, and Denise Sorisio* 201

Hydergine Treatment and Brain Functioning (CNV Rebound) in Alzheimer's Patients: Preliminary Findings—*Joseph J. Tecce, Mary Beth Boehner, Lynn Cattanach, Roland Branconnier, and Jonathan O. Cole* 202

1-Desamino-D-Arginine Vasopressin (DDAVP) in Cognitively Impaired Patients—*Jared R. Tinklenberg, Adolf Pfefferbaum, and Philip A. Berger* 206

Platelet Monoamine Oxidase (MAO) and Clinical Variables in Schizophrenia: Interrelationships with Spinal Fluid Norepinephrine (NE) and Dopamine-beta-hydroxylase (DBH)—*Daniel P. van Kammen, Kenneth L. Malas, David E. Sternberg, Dennis L. Murphy, Pauline Lerner, C. Raymond Lake, Lynne A. Dalton, and William E. Bunney, Jr.* 207

Psychopharmacology—A Recurring Bibliography—

Meeting Announcement 1
Book Review 1
Adverse Drug Reactions—More on Lithium-Related Leukemia 5
Availability of Psychotropic Compounds 6
Report from a Mental Health Research Center—
  Western Psychiatric Institute and Clinic—*David J. Kupfer* 9
Review—
  Electroconvulsive Therapy Update—*Joyce G. Small and Iver F. Small* 29
Articles—
  Structural Correlates of the Aging Process in the Brain—*Kenneth R. Brizzee* 43
  Maintenance Treatment of Unipolar Depression—*Eric D. Peselow, David L. Dunner, Ronald R. Fieve, Gary Gulbenkian, Stephen I. Deutsch, and Michael Kaufmann* 53
The Bureau of Drugs' Symposium on the Development of Psychopharmacologic Drugs for the
  Cognitively and Emotionally Impaired Elderly: Background and Aims—*Paul Leber* 57
  Pharmacology and Aging—*Robert N. Butler* 58
  Some Ethical and Legal Considerations—*Robert Schwartz* 64
  Problems in Assessing Response to Treatment in the Elderly by Physical and Social Function—*Margaret W. Linn and Bernard S. Linn* 74
  The Evaluation of Ward Behavior Rating Scales for Psychogeriatric Use—*Gilbert Honigfeld* 82
  The Assessment of Behavioral Changes in Geriatric Patients—*J. Richard Wittenborn* 96
  Special Considerations in the Assessment of Psychopathology in the Elderly—*Allen Raskin* 104
  The Conduct of Clinical Trials in the Impaired Elderly—*Samuel Gershon* 108

Psychopharmacology — A Recurring Bibliography

The bibliography below is offered to our readers to alert them to recent papers on psychopharmacology from the world literature. It was computer-generated by the Medical Literature Analysis and Retrieval System (MEDLARS) of the National Library of Medicine, National Institutes of Health, and represents papers which were entered into the system during the 3 months before the *Bulletin* went to press.

The subject headings from Index Medicus were selected by the WHO International Reference Center at the NIMH to reflect significant current interest of the international scientific community. Some nonrelevant citations may appear, and some relevant ones may be absent, but this is usual for machine-generated searches. Each subsequent issue of the *Bulletin* will provide such a bibliography, which contains two parts — a Subject Section and an Author Section.

Comments and suggestions are invited.

ISSN 0048-5764

SUBJECT SECTION

ACEPROMAZINE

Determination of blood pressure by indirect methods in dogs given acetylpromazine maleate. Coulter DB, et al. **Cornell Vet** 1981 Jan; 71(1):75–84

The metabolism of promazine and acetylpromazine in the horse. Dewey EA, et al. **Drug Metab Dispos** 1981 Jan–Feb;9(1):30–6

ACETYLCHOLINE

Acetylcholine-like activity in the fruit of the black nightshade (Solanaceae). de Melo AC, et al. **Acta Physiol Lat Am** 1978; 28(4–5):19–26

Correlation between cholinergic histamine release and quinuclidinyl-benzilate ([3H]-QNB) binding in mast cell membranes. Masini E, et al. **Agents Actions** 1981 Apr;11(1–2):55–9

Release of acetylcholine in the isolated heart. Löffelholz K. **Am J Physiol** 1981 Apr;240(4):H431–40 (101 ref.)

Electrophysiological effects of acetylcholine on rabbit cardiac Purkinje Fibers. Mubagwa K, et al. **Arch Int Pharmacodyn Ther** 1981 Feb; 249(2):326–7

Requirement for calcium ions in acetylcholine-stimulated phosphodiesteratic cleavage of phosphatidyl-myo-inositol 4,5-bisphosphate in rabbit iris smooth muscle. Akhtar RA, et al. **Biochem J** 1980 Dec 15;192(3):783–91

Reconstitution of acetylcholine receptor function using purified receptor protein. Wu WC, et al. **Biochemistry** 1981 Feb 17;20(4):694–701

Effects of cholinergic stimulation on levels and fatty acid composition of diacylglycerols in mouse pancreas. Banschbach MW, et al. **Biochim Biophys Acta** 1981 Jan 26;663(1):34–45

Cyclic nucleotides of canine antral smooth muscle. Effects of acetylcholine, catecholamines and gastrin. Baur S, et al. **Biochim Biophys Acta** 1981 Jan 7;672(1):1–6

Changes in acetylcholine in caudate nucleus tissue isolated in situ detected by gas chromatography mass spectrometry selected ion monitoring. Haug P, et al. **Biomed Mass Spectrom** 1980 Nov;7(11–12):533–6

A comparison of stereospecificity at central and peripheral 'muscarine-sensitive' acetylcholine receptors: observations with the enantiomeric forms of procyclidine and tricyclamol. Barlow RB, et al. **Br J Pharmacol** 1981 Feb;72(2):277–80

5-hydroxytryptamine controls ACh-receptor sensitivity of bullfrog sympathetic ganglion cells. Akasu T, et al. **Brain Res** 1981 Apr 27; 211(1):217–20

Acetylcholine induced modulation of hippocampal pyramidal neurons. Benardo LS, et al. **Brain Res** 1981 Apr 27;211(1):227–34

Ontogenetic development of high potassium- and acetylcholine-induced release of dopamine from striatal slices of the rat. Nomura Y, et al. **Brain Res** 1981 Apr;227(2):171–7

Maintenance and dissolution of acetylcholine receptor clusters in the embryonic muscle cell membrane. Orida N, et al. **Brain Res** 1981 Apr; 227(2):293–8

Evidence of the modulatory role of serotonin in acetylcholine release from striatal interneurons. Vizi ES, et al. **Brain Res** 1981 May 11; 212(1):89–99

Potentiation and inhibition of nicotinic effects on striated muscle by the tetramine disulfide benextramine. Benfey BG, et al. **Can J Physiol Pharmacol** 1980 Aug;58(8):984–8

Gastric inhibitory polypeptide stimulated secretion of somatostatinlike immunoreactivity from the stomach: inhibition by acetylcholine or vagal stimulation. McIntosh CH, et al. **Can J Physiol Pharmacol** 1981 May; 59(5):468–72

Selective inhibition of schistosome acetylcholinesterase by dansylated acetylcholine analogs. Dotson MJ, et al. **Comp Biochem Physiol [C]** 1981;68C(2):229–30

Effect of acetylcholine on calcium efflux from atrial myocardium. Prokopczuk A, et al. **Eur J Pharmacol** 1981 Mar 5;70(1):1–6

Conformational analysis of the reverse ester of acetylcholine, cholinergic potency, and cholinergic models. Reed KW, et al. **Gen Pharmacol** 1981; 12(3):177–85

Human fetal membranes: investigations on membrane potentials and membrane 24Na permeability in vitro and the possible involvement of acetylcholine. Welsch F. **Gynecol Obstet Invest** 1981;12(3):113–22

Control of glycogen synthesis in isolated rat hepatocytes by insulin, glucagon & acetylcholine. Beynen AC, et al. **Indian J Exp Biol** 1981 Jan;19(1):46–8

Effect of ovulation on the response of the rabbit oviduct to acetylcholine in vitro. Rajkumar K, et al. **Int J Fertil** 1981;26(1):57–60

Stabilization of acetylcholine receptor channels by lipids in cholate solution and during reconstitution in vesicles. Anholt R, et al. **J Biol Chem** 1981 May 10;256(9):4377–87

Acetyl coenzyme A and acetylcholine in slices of rat caudate nuclei incubated in the presence of metabolic inhibitors. Říčný J, et al. **J Biol Chem** 1981 May 25;256(10):4919–23

Acetylcholine receptor kinetics. Adams PR. **J Membr Biol** 1981 Feb 28; 58(3):161–74 (132 ref.)

Mechanisms for the effects of acetylcholine on sodium transport in frog skin. Cuthbert AW, et al. **J Membr Biol** 1981 Mar 15;59(1):65–75

Acetylcholine receptor-controlled ion flux in electroplax membrane vesicles: identification and characterization of membrane properties that affect ion flux measurements. Kim PS, et al. **J Membr Biol** 1981 Feb 28;58(3):203-11

Acetylcholine turnover and compartmentation in rat brain synaptosomes. Jope RS. **J Neurochem** 1981 May;36(5):1712-21

Simultaneous release of acetylcholine and ATP from stimulated cholinergic synaptosomes. Morel N, et al. **J Neurochem** 1981 May; 36(5):1766-73

The release of gamma-aminobutyric acid, glutamate, and acetylcholine from striatal slices: a mass fragmentographic study. Moroni F, et al. **J Neurochem** 1981 May;36(5):1691-9

Choline uptake and acetylcholine synthesis in synaptosomes: investigations using two different labeled variants of choline. Weiler MH, et al. **J Neurochem** 1981 May;36(5):1802-12

The effect of cold stress on the modulation of vascular adrenergic transmission by acetylcholine. Merrigan MD, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):142-7

The effect of phencyclidine on the turnover rate of acetylcholine in various regions of rat brain. Murray TF, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):733-7

Effects of acute and chronic administration of DDVP (dichlorvos) on distribution of brain acetylcholine in rats. Kobayashi H, et al. **J Toxicol Sci** 1980 Nov;5(4):311-9

Effect of progesterone therapy on the responses of the isolated rat stomach fundus strip preparations to 5-hydroxytryptamine and acetylcholine. Qayum A, et al. **JPMA** 1981 Apr;31(4):84-8

A further study on constrictor responses of dog coronary arterial strips to acetylcholine under potassium-contracture. Sakanashi M, et al. **Jpn Heart J** 1981 Mar;22(2):211-7

Cat heart acetylcholine: unilateral vagotomy studies with pyrolysis-mass fragmentography. Brown OM. **Life Sci** 1981 Feb 16;28(7):819-25

Action of colchicine on cholinergic and adrenergic mechanisms in guinea pig vas deferens. Takeyasu K, et al. **Life Sci** 1981 Feb 23; 28(8):851-60

The identification of an invertebrate acetylcholine receptor. Thomas WE, et al. **Life Sci** 1981 Mar 2;28(9):965-71 (42 ref.)

Piracetam diminishes hippocampal acetylcholine levels in rats. Wurtman RJ, et al. **Life Sci** 1981 Mar 9;28(10):1091-3

Does rigidity in structure of muscarinic agonists and antagonists reflect drug specificity? Fisher A, et al. **Monogr Neural Sci** 1980;7:41-54

Regulation of acetylcholine liberation from presynaptic nerve terminals. Rahamimoff R, et al. **Monogr Neural Sci** 1980;7:3-18

Multiple actions of beta-bungarotoxin on acetylcholine release at amphibian motor nerve terminals. Alderdice MT, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):126-30

Tetanus toxin and botulinum A toxin inhibit acetylcholine release from but not calcium uptake into brain tissue. Bigalke H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):143-8

Choline inhibits acetylcholine release via presynaptic muscarine receptors. Kilbinger H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr; 316(2):131-4

A comparison of the actions of acetylcholine and bradykinin on the guinea pig ileum. Roberts ML. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):267-70

Changes in the biochemical and biophysical parameters of cholinergic synaptic vesicles on transmitter release and during a subsequent period of rest. Giompres PE, et al. **Neuroscience** 1981;6(4):775-85

Ultrastructural localization of VIP-like immunoreactivity in large dense-core vesicles of 'cholinergic-type' nerve terminals in cat exocrine glands. Johansson O, et al. **Neuroscience** 1981;6(5):847-62

Factors affecting choline transport by the cat superior cervical ganglion during and following stimulation, and the relationship between choline uptake and acetylcholine synthesis. O'Regan S, et al. **Neuroscience** 1981; 6(3):511-20

The time course of the muscarinic response to ionophoretic acetylcholine application to the S-A node of the rabbit heart. Osterrieder W, et al. **Pfluegers Arch** 1981 Mar;389(3):283-91

Interactions between ionophores, Mg2+ and Ca2+ on acetylcholine formation and release in brain slices. Mantovani P, et al. **Pharmacol Res Commun** 1981 Feb;13(2):175-64

Saturable acetylcholine transport into purified cholinergic synaptic vesicles. Michaelson DM, et al. **Proc Natl Acad Sci USA** 1981 Apr; 78(4):2048-52

Catecholamines, acetylcholine and excitability of mechanoreceptors. Akoev GN. **Prog Neurobiol** 1980;15(4):269-94

Effects of lithium on behavioral reactivity: relation to increases in brain cholinergic activity. Russell RW, et al. **Psychopharmacology (Berlin)** 1981;73(2):120-5

Pirenzepine selectively inhibits gastric acid secretion: a comparative pharmacological study between pirenzepine and seven other antiacetylcholine drugs. Heathcote BV, et al. **Scand J Gastroenterol [Suppl]** 1980;15(66):15-26

Increase of evoked release of acetylcholine at the neuromuscular junction by a fraction from the venom of the eastern green mamba snake (Dendroaspis angusticeps). Harvey AL, et al. **Toxicon** 1981; 19(3):373-81

[Effect of social isolation on the transmitter sensitivity of striatal and hippocampal neurons of the rat] Oehler J, et al. **Acta Biol Med Ger** 1980;39(10):1089-93 (Eng. Abstr.) **(Ger)**

[Structure and conformation-activity relationships of cyclic acetylcholine analogues / 12th communication: Synthesis and cholinergic properties of stereoisomeric 3-acetoxythiacyclohexanes (author's transl)] Lambrecht G. **Arzneimittelforsch** 1981;31(4):634-40 (Eng. Abstr.) **(Ger)**

[Effect of acetylcholine and adrenaline on membrane currents in ventricular muscle (author's transl)] Ochi R. **Kokyu To Junkan** 1980 Oct;28(10):1103-9 **(Jpn)**

[Effect of adrenaline, noradrenaline and acetylcholine on rabbit and human uterine activity in vivo (author's transl)] Sakoda H. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 Jun;32(6):697-705 (Eng. Abstr.) **(Jpn)**

[Activation of Na, K-ATPase from nerve cell microsomes by acetylcholine in a model system] Elaev NR. **Biokhimiia** 1980 Oct; 45(10):1749-54 (Eng. Abstr.) **(Rus)**

[Effect of cholinergic factors on the state of erythrocyte membrane proteins of animals] Savina LS, et al. **Biull Eksp Biol Med** 1981 Feb; 91(2):153-5 (Eng. Abstr.) **(Rus)**

AFFECTIVE DISORDERS

Prophylactic effect of lithium against depression in cyclothymic patients: a life-table analysis. Peselow ED, et al. **Compr Psychiatry** 1981 May-Jun;22(3):257-64

Increased platelet monoamine oxidase activity in affective disorders. Reveley MA, et al. **Psychopharmacology (Berlin)** 1981;73(3):257-60

Methylphenidate in depression and states of apathy. Moore DP. **South Med J** 1981 Mar;74(3):347-8

AFFECTIVE DISORDERS, PSYCHOTIC

The antidepressant efficacy of zimelidine and maprotiline. Montgomery SA, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):219-24

Specific norepinephrine and serotonin uptake inhibitors in man: a crossover study with pharmacokinetic, biochemical, neuroendocrine and behavioral parameters. Potter WZ, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):152-65

Psychotropic drugs: lithium. Harris E. **Am J Nurs** 1981 Jul; 81(7):1311-5

Current concepts of lithium therapy [letter] Coppen A, et al. **Br J Hosp Med** 1981 Mar;25(3):309-10

Lithium updated. **Drug Ther Bull** 1981 Mar 13;19(6):21-4

Lithium response in the treatment of manic symptomatology. Channabasavanna SM, et al. **Indian J Med Res** 1980 Dec;72:908-9

Circadian rhythms of dopamine-beta-hydroxylase and c-AMP in plasma of controls and patients with affective disorders. Markianos M, et al. **J Neural Transm** 1981;50(2-4):149-55

Antidepressant efficacy of tranylcypromine isomers: a controlled study. Moises HW, et al. **J Neural Transm** 1981;50(2-4):185-92

Changes in blood plasma osmolality and states of mania. Baxter CF, et al. **Neurochem Res** 1981 Jan;6(1):47-53

Slow and rapid onset of manic episodes: implications for underlying biology. Post RM, et al. **Psychiatry Res** 1981 Apr;4(2):229-37

Vasopressin function in depression and mania [proceedings] Gold PW, et al. **Psychopharmacol Bull** 1981 Jan;17(1):7-9

Lithium and mania. Tosteson DC. **Sci Am** 1981 Apr; 244(4):164-6, 168, 171-2 et passim

[Modifications of cerebral amine metabolism in psychiatric illness] Linkowski P, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):559-73 (38 ref.) **(Fre)**

[Different effects of tricyclic (clomipramine and amitriptyline) and tetracyclic (maprotiline) antidepressors on the release of thyroid stimulating hormone, prolactin and growth hormone to thyrostimulating releasing hormone in patients with psychoaffective disorders (author's transl)] Schlienger JL, et al. **Acta Psychiatr Belg** 1980 Sep-Oct; 80(5):584-99 (Eng. Abstr.) **(Fre)**

[Pharmacokinetic study of delayed-action lithium in affective psychoses] Molcan J, et al. **Agressologie** 1980;21(A):11-4 (Eng. Abstr.) **(Ger)**

AGGRESSION

The septal forebrain and the inhibitory modulation of attack and defense in the rat. A review. Albert DJ, et al. **Behav Neural Biol** 1980 Dec; 30(4):357-88 (192 ref.)

Ergot drugs suppress plasma prolactin and lactation but not aggression in parturient mice. Mann M, et al. **Horm Behav** 1980 Dec; 14(4):[illegible]9-28

The psychopharmacology of aggression and social behavior. Symposium of the International Society for Research on Aggression. July 12, 1980, Groningen, The Netherlands. **Pharmacol Biochem Behav** 1981; 14 Suppl 1:1-124

6-hydroxydopamine and aggression in cats. Beleslin DB, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:29–32

The effects of antidepressants on aggressiveness induced by social deprivation in mice. Delini-Stula A, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:33–41

Drug effects on attack defense and escape in mice. Kršiak M, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:47–52

Involvement of the GABAergic system on shock-induced aggressive behavior in two strains of mice. Puglisi-Allegra S, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:13–8

Tryptophan deprivation: effects on mouse-killing and reactivity in the rat. Vergnes M, et al. **Pharmacol Biochem Behav** 1981; 14 Suppl 1:19–23

Subchronic treatment with the tricyclic antidepressant DMI increases isolation-induced fighting in rats. Willner P, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):475–9

Cerebrospinal fluid amine metabolites and cyclic nucleotides in human aggression [proceedings] Brown GL, et al. **Psychopharmacol Bull** 1981 Jan;17(1):63–5

Drug regimens facilitating aggression: behavior, amine, and receptor alterations [proceedings] Eichelman B. **Psychopharmacol Bull** 1981 Jan; 17(1):58–60

Discussion of paper by Dr. Klaus Miczek [proceedings] McKinney WT Jr. **Psychopharmacol Bull** 1981 Jan;17(1):62–3

Pharmacological evidence for catecholamine involvement in animal aggression [proceedings] Miczek KA. **Psychopharmacol Bull** 1981 Jan; 17(1):60–2

Effects of lithium carbonate and haloperidol on cognition in aggressive, hospitalized school age children [proceedings] Platt JE, et al. **Psychopharmacol Bull** 1981 Jan;17(1):123–5

Changes of response to dopaminergic drugs in rats submitted to REM-sleep deprivation. Tufik S. **Psychopharmacology (Berlin)** 1981; 72(3):257–60

Aggressive behavior of the rat induced by repeated administration of cadmium. Arito H, et al. **Toxicol Lett** 1981 Mar;7(6):457–61

[Psychotropic drugs and imprisonment in a psychiatric hospital for political reasons] Drucker H. **Acta Med Leg Soc (Liege)** 1980; 30(1):189–210 **(Fre)**

[The medical marking of the body. Or when the physician becomes the stigmatizer] Lenoir L, et al. **Acta Med Leg Soc (Liege)** 1980; 30(1):43–69 **(Fre)**

AMINO ACIDS

Determination of the N-terminal amino acids of ribosomal proteins after gel electrophoretical purification. Etzold G, et al. **Acta Biol Med Ger** 1980;39(11–12):1143–6

Rapid separation of amino acid phenylthiohydantoins by isocratic high-performance liquid chromatography. Tarr GE. **Anal Biochem** 1981 Feb;111(1):27–32

Amino acid transport, Na+/K+-ATPASE, and TAT induction in monolayer cultures of hepatocytes from developing rats. Bellemann P, et al. **Ann NY Acad Sci** 1980;349:385–6

Excitatory amino acid transmitters. Watkins JC, et al. **Annu Rev Pharmacol Toxicol** 1981;21:165–204 (294 ref.)

Plasma tryptophan and five other amino acids in depressed and normal subjects. DeMyer MK, et al. **Arch Gen Psychiatry** 1981 Jun; 38(6):642–6

Regulation of small RNAs in Escherichia coli. Alteration in the intracellular concentrations of small RNAs during amino acid and energy starvation. Pao CC, et al. **Biochim Biophys Acta** 1981 Mar 26; 653(1):1–8

The release of endogenous amino acids into the vitreous of the intact eye of the albino rat: effect of light, potassium, and ouabain. Coull BM, et al. **Brain Res** 1981 Apr 6;210(1–2):301–9

Regional release of [3H]adenosine derivatives from rat brain in vivo: effect of excitatory amino acids, opiate agonists, and benzodiazepines. Jhamandas K, et al. **Can J Physiol Pharmacol** 1980 Nov; 58(11):1262–78

The postexcitatory effects of acidic amino acids on spinal neurones. McLennan H, et al. **Can J Physiol Pharmacol** 1981 Mar; 59(3):239–43

Interaction between amino acid induced and K+-induced depolarization of primary afferents in the bullfrog spinal cord. Shefner SA, et al. **Can J Physiol Pharmacol** 1980 Nov;58(11):1286–94

Evidence that the depolarization of glial cells by inhibitory amino acids is caused by an efflux of K+ from neurones. Hösli L, et al. **Exp Brain Res** 1981;42(1):43–8

The radioautographical localization in the vertebrate retina of [3H]-(+ or −)-cis-aminocyclohexane carboxylic acid (ACHC); a selective inhibitor of neuronal GABA transport. Cunningham J, et al. **Exp Eye Res** 1981 Apr;32(4):445–50

Metabolic control for maintaining NAD in rats fed on tryptophan-limiting amino acid diets. Shibata K, et al. **J Nutr Sci Vitaminol (Tokyo)** 1980; 26(6):571–84

Plasma and erythrocyte concentrations of free amino acids in adult humans administered abuse doses of aspartame. Stegink LD, et al. **J Toxicol Environ Health** 1981 Feb;7(2):291–305

Inhibition of enkephalin-degrading enzymes from rat brain and of thermolysin by amino acid hydroxamates. Blumberg S, et al. **Life Sci** 1981 Jan 19;28(3):301–6

Pharmacological antagonists of excitant amino acid action. Evans RH, et al. **Life Sci** 1981 Mar 23;28(12):1303–8

Characteristics of synaptosomal tyrosine uptake in various brain regions: effect of other amino acids. Morre MC, et al. **Life Sci** 1981 Jan 5; 28(1):65–75

Adsorption of amino acid entantiomers by Na-montmorillonite. Friebele E, et al. **Orig Life** 1981 Mar–Jun;11(1–2):173–84

[Fragile site Xq27 and metabolism of monocarbons. Significant decrease of the frequency of chromosomal gaps by treatment in vitro and in vivo] Lejeune J, et al. **C R Acad Sci [D] (Paris)** 1981 Feb 16; 292(7):491–3 (Eng. Abstr.) **(Fre)**

[A comparative analysis of the proteins of wheat, rye and Triticale T275 and T294. III. Content of tryptophan and tyrosine in gliadines and glutenines and N-end amino acids of gliadine fraction (author's transl)] Górski A, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979; 34:311–6 (Eng. Abstr.) **(Pol)**

[Dansylated amino acid separation by polyacrylamide gel electrophoresis] Svinarchuk FP, et al. **Prikl Biokhim Mikrobiol** 1981 Jan–Feb; 17(1):144–50 (Eng. Abstr.) **(Rus)**

AMITRIPTYLINE

MAO inhibition and control of anxiety following amitriptyline therapy. A pilot study. Davidson J, et al. **Acta Psychiatr Scand** 1981 Feb; 63(2):147–52

A double-blind comparison of nomifensine and amitriptyline in the treatment of depression. Ong SB, et al. **Acta Psychiatr Scand** 1981 Mar; 63(3):198–207

Comparison of the cardiovascular effects of amitriptyline and zimelidine using thoracic impedance cardiography. Christie JE, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):385–92

Zimelidine and amitriptyline in the treatment of depressive illness in general practice. Loudon JB, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):454–63

A double blind comparison of zimelidine and amitriptyline in endogenous depression. Montgomery SA, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):314–27

Cardiovascular, sedative and anticholinergic effects of amitriptyline and zimelidine in young and elderly volunteers. Swift CG, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):425–32

Effect of alcohol consumption and cigarette smoking on antidepressant levels of depressed patients. Linnoila M, et al. **Am J Psychiatry** 1981 Jun;138(6):841–2

alpha 2-Adrenoreceptors in rat brain are decreased after long-term tricyclic antidepressant drug treatment. Smith CB, et al. **Brain Res** 1981 Apr 6;210(1–2):413–8

Cyclobenzaprine: a possible mechanism of action for its muscle relaxant effect. Commissiong JW, et al. **Can J Physiol Pharmacol** 1981 Jan; 59(1):37–44

Treatment of fibromyositis with fluphenazine and amitriptyline: a preliminary report. Connolly RG. **Del Med J** 1981 Apr;53(4):189–91

Cardiovascular effects of mianserin and amitriptyline in healthy volunteers. Wester HA, et al. **Int J Clin Pharmacol Ther Toxicol** 1980 Dec;18(12):513–7

Inhibition of riboflavin metabolism in rat tissues by chlorpromazine, imipramine, and amitriptyline. Pinto J, et al. **J Clin Invest** 1981 May; 67(5):1500–6

A double-blind study of dothiepin hydrochloride (Prothiaden) and amitriptyline in out-patients with masked depression. Dahl LE, et al. **J Int Med Res** 1981;9(2):103–7

A comparison of the therapeutic and cardiovascular effects of a single nightly dose of Prothiaden (dothiepin, dosulepin) and Lentizol (sustained-release amitriptyline) in depressed elderly patients. Khan AU. **J Int Med Res** 1981;9(2):108–12

Possible involvement of cyclic AMP and frontal cortex in amitriptyline mediated suppression of the hypotensive effect of clonidine. Greenberg S, et al. **Life Sci** 1980 Dec 22–29;27(25–26):2669–74

In defense of 'Limbitrol' [letter] Dudley RD Jr. **Minn Med** 1980 Oct; 63(10):713

Comparison of the antimuscarinic activity of mianserin and amitriptyline in the cat superior cervical ganglion. Kwok YH, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):161–4

Relationship between response to phenelzine and MAO inhibition in a clinical trial of phenelzine, amitriptyline and placebo. Raft D, et al. **Neuropsychobiology** 1981;7(3):122–6

Differential effect of chronic desipramine and amitriptyline treatment on rat brain adrenergic and serotonergic receptors. Tang SW, et al. **Psychiatry Res** 1981 Apr;4(2):129–38

On the clinical response/serum level relationship for antidepressants I: Amitriptyline. Dutt JE. **Psychopharmacol Bull** 1981 Apr;17(2):42–55

Effects of phenelzine and amitriptyline on depression [proceedings] Paykel ES, et al. **Psychopharmacol Bull** 1981 Jan;17(1):104–6

The relationships between clinical response, psychophysiological variables and plasma levels of amitriptyline and diazepam in neurotic outpatients. Johnstone EC, et al. **Psychopharmacology (Berlin)** 1981;72(3):233–40

Medical therapies for mood disorders alter the blood–brain barrier. Preskorn SH, et al. **Science** 1981 Jul 24;213(4506):469–71

[Therapy of elderly depressive patients. Lofepramine and amitriptyline under double-blind conditions] Jessel HJ, et al. **ZFA (Stuttgart)** 1981 Apr 10;57(10):784–8 **(Ger)**

AMOBARBITAL

Habituation of the head–poke response: effects of an amphetamine–barbiturate mixture, PLG and fenfluramine. Koek W, et al. **Psychopharmacology (Berlin)** 1981;72(3):251–6

AMPHETAMINE

Investigations on the interaction between cyproheptadine and amphetamine. Cenajek D, et al. **Acta Physiol Pol** 1980;31(5):561–6

A primate analogue of amphetamine–induced behaviors in humans. Haber S, et al. **Biol Psychiatry** 1981 Feb;16(2):181–96

Effect of amphetamine on the metabolism and incorporation of [3H]–thymidine into DNA of developing rat brain. Béndek G, et al. **Dev Neurosci** 1981;4(1):55–65

Detection of amphetamine in bloodstains, semen, seminal stains, saliva, and saliva stains. Smith FP. **Forensic Sci Int** 1981 May–Jun; 17(3):225–8

Analysis of amphetamine effects on agonistic and affiliative behavior in squirrel monkeys (Saimiri sciureus). Miczek KA, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:103–7

An analysis of visual object reversal learning in the marmoset after amphetamine and haloperidol. Ridley RM, et al. **Pharmacol Biochem Behav** 1981 Mar;14(3):345–51

Computer analyzed EEG in amphetamine–responsive hyperactive children. McIntyre HB, et al. **Psychiatry Res** 1981 Apr;4(2):189–97

Habituation of the head–poke response: effects of an amphetamine–barbiturate mixture, PLG and fenfluramine. Koek W, et al. **Psychopharmacology (Berlin)** 1981;72(3):251–6

[The influence of trihexyphenidyl on the antiamphetaminic action of fluphenazine (author's transl)] Kleinrok Z, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979;34:341–5 (Eng. Abstr.) **(Pol)**

[The influence of atropine on the antiamphetaminic action of fluphenazine (author's transl)] Rechberger T, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979;34:333–9 (Eng. Abstr.) **(Pol)**

[Effect of certain pharamcologic preparations and different lighting setups on human work capacity] Bogatova RI, et al. **Kosm Biol Aviakosm Med** 1981 Jan–Feb;15(1):92–3 **(Rus)**

AMPHETAMINES

Recommendations for demand reduction of amphetamines. Streit F. **Chem Depend** 1980;4(1–2):135–43

Quantitation of biologically important primary amines as their isothiocyanate derivatives by gas chromatography using nitrogen detector and validation by selected ion monitoring. Narasimhachari N, et al. **Clin Chim Acta** 1981 Mar 5;110(2–3):235–43

Amphetamine radioimmunoassay––structure versus reactivity. Budd RD. **Clin Toxicol** 1981;18(3):299–316

A death due to 4–bromo–2,5–dimethoxyamphetamine. Winek CL, et al. **Clin Toxicol** 1981;18(3):267–71

Effects of the optical isomers of 2–amino–3–fluoro–1–phenylpropane (monofluoroamphetamine) hydrochloride on uptake and release of dopamine in rat striatum in vitro. Benderly A, et al. **Experientia** 1981 Mar 15;37(3):294–5

The effects of p–chloroamphetamine administration on locomotor activity and serotonin in neonatal and adult rats. Lucot JB, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):738–44

Estrogen potentiates the stereotypy induced by dopamine agonists in the rat. Chiodo LA, et al. **Life Sci** 1981 Feb 16;28(7):827–35

DOM and related 2,5–dimethoxy–4–alkylphenylisopropylamines: behavioral and serotonin receptor properties. Glennon RA, et al. **Pharmacol Biochem Behav** 1981 Mar;14(3):287–92

Effects of dorsolateral tegmental lesions on amphetamine– and lithium–induced taste aversions. Wellman PJ, et al. **Physiol Behav** 1981 Feb;26(2):341–4

The effect of altered dopaminergic activity on food intake in the rat: evidence for an optimal level of dopaminergic activity for behavior. Zigmond MJ, et al. **Prog Neuropsychopharmacol** 1980;4(4–5):351–62

The metabolism of 3–methoxyamphetamine in dog, monkey and man. Midha KK, et al. **Xenobiotica** 1981 Feb;11(2):137–46

ANGER

The septal forebrain and the inhibitory modulation of attack and defense in the rat. A review. Albert DJ, et al. **Behav Neural Biol** 1980 Dec; 30(4):357–88 (192 ref.)

ANOREXIA NERVOSA

Schizophrenia and anorexia nervosa. Hsu LK, et al. **J Nerv Ment Dis** 1981 May;169(5):273–6

ANTIDEPRESSIVE AGENTS

Controlled cross–over study of a 5–HT uptake inhibiting and an NA uptake inhibiting antidepressant. Aberg A. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):244–55

Effects of antidepressants on cardiac function. Burgess CD. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):370–9

Some current problems related to the mode of action of antidepressant drugs. Carlsson A. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):63–6

Comparison of the cardiovascular effects of amitriptyline and zimelidine using thoracic impedance cardiography. Christie JE, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):385–92

The action of antidepressant drugs on 5–hydroxy–tryptamine uptake by platelets––relationship to therapeutic effect. Coppen A, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):236–43

Zimelidine to geriatric patients: a pharmacokinetic and clinical study. Dehlin O, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):410–24

Zimelidine vs maprotiline in depressed outpatients. A preliminary report. d'Elia G, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):225–35

Pre– and postsynaptic effects of zimelidine and norzimelidine on the serotoninergic system: single cell studies in the rat. de Montigny C, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):79–90

Safety data on zimelidine hydrochloride following an overdose. Georgotas A, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):257–61

Influence of depression and antidepressants on weight. Gottfries CG. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):353–6

Critical flicker fusion (CFF) test for sedative effect of antidepressants. Holmberg G. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):289–301

Depression: treatment compliance in general practice. Johnson DA. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):447–53

Beta–adrenergic stimulation and antidepressant activity. Lecrubier Y, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):173–8

Cardiovascular effects of zimelidine and other antidepressant in conscious rats. Lindbom LO, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):380–4

Zimelidine and amitriptyline in the treatment of depressive illness in general practice. Loudon JB, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):454–63

Effect of antidepressants, lithium and electroconvulsive treatment on rat serum prolactin levels. Meltzer HY, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):100–21

The antidepressant efficacy of zimelidine and maprotiline. Montgomery SA, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):219–24

A double blind comparison of zimelidine and amitriptyline in endogenous depression. Montgomery SA, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):314–27

Sedative/anxiolytic effects of antidepressants in animals. Ogren SO, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):277–88

Comparison of peripheral anticholinergic effects of antidepressants: dry mouth. Rafaelsen OJ, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):364–9

Central pre– and postsynaptic monoamine receptors in antidepressant therapy. Svensson TH, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):67–78

Cardiovascular, sedative and anticholinergic effects of amitriptyline and zimelidine in young and elderly volunteers. Swift CG, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):425–32

Zimelidine: comparison of different dosage regimes in general practice. Watson JM, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):464–70

Antidepressant drug therapy. DeGennaro M, et al. **Am J Nurs** 1981 Jul; 81(7):1304–10

Antidepressants: old drugs, new uses. Harris E. **Am J Nurs** 1981 Jul; 81(7):1308–9

Metabolism of zimelidine in rat, dog and man. Identification and synthesis of the principal metabolites. Lundström J, et al. **Arzneimittelforsch** 1981; 31(3):486–94

Determination of clovoxamine concentration in human plasma by electron capture gas chromatography. Hurst HE, et al. **Clin Chem** 1981 Jul; 27(7):1210–2

Effect of piribedil (ET–495) on plasma norepinephrine: relationship to antidepressant response. Reus VI, et al. **Commun Psychopharmacol** 1980; 4(3):207–13

The antidepressant effect of lithium. Arieli A, et al. **Curr Dev Psychopharmcol** 1981;6:165–90 (58 ref.)

Adverse effects of antidepressant drugs. Part 2: 'Second generation' antidepressants and rational decision making in antidepressant therapy.

Blackwell B. **Drugs** 1981 Apr;21(4):273–82 (120 ref.)
Classification, biochemistry of depression and the mode of action of antidepressant drugs. Okasha A. **Egypt J Psychiatry** 1979 Apr; 2(1):3–18
Effects of antidepressant drugs on different receptors in the brain. Hall H, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):393–407
Radioimmunoassay and pharmacokinetic profile of bupropion in the dog. Butz RF, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):602–10
Effects of acutely and chronically administered antidepressants on the clonidine-induced decrease in rat brain 3-methoxy-4-hydroxyphenylethylene-glycol sulphate content. Sugrue MF. **Life Sci** 1981 Jan 26;28(4):377–84
Acceleration of beta-receptor desensitization in combined administration of antidepressants and phenoxybenzamine. Crews FT, et al. **Nature** 1981 Apr 30;290(5809):787–9
Evaluation of the clinical efficacy of single daily doses of antidepressants. De Maio D, et al. **Prog Neuropsychopharmacol** 1980;4(6):607–12
The neuro- and cardiovascular pharmacology of RS-51324, a potential antidepressant. Wallach MB, et al. **Prog Neuropsychopharmacol** 1980; 4(6):569–84
Clinical efficacy of the new antidepressant bupropion (Wellbutrin) [proceedings] Halaris AE, et al. **Psychopharmacol Bull** 1981 Jan; 17(1):140–2
Second generation antidepressants: a clinical pharmacotherapeutic research strategy [proceedings] Shopsin B. **Psychopharmacol Bull** 1981 Jan;17(1):33–5
The pharmacological treatment of schizoaffective disorder-depressed: a review of the literature [proceedings] Spiker DG. **Psychopharmacol Bull** 1981 Jan;17(1):75–8
[Different effects of tricyclic (clomipramine and amitriptyline) and tetracyclic (maprotiline) antidepressors on the release of thyroid stimulating hormone, prolactin and growth hormone to thyrostimulating releasing hormone in patients with psychoaffective disorders (author's transl)] Schlienger JL, et al. **Acta Psychiatr Belg** 1980 Sep–Oct; 80(5):584–99 (Eng. Abstr.) **(Fre)**

ANXIETY

The treatment of phobic anxiety by zimelidine. Evans L, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):342–5
Anxiety and/or the depressive syndromes. Kline NS. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):271–6
A pilot study of the effect of the 5-HT-uptake inhibitor, zimelidine, on phobic anxiety. Koczkas S, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):328–41
Maternal psychological and physiologic correlates of fetal-newborn health status. Lederman E, et al. **Am J Obstet Gynecol** 1981 Apr 15; 139(8):956–8
Antianxiety, sedative hypnotics. Cooper Sa. **Clin Prevent Dent** 1981 Jan–Feb;3(1):25–6
Oxazepam in the treatment of anxiety associated with depression: results of treatment in 1600 cases (Studies in depression, VI). Bailey HR, et al. **Curr Med Res Opin** 1981;7(3):156–63
Tranquilizers not overprescribed for anxiety [news] Korcok M. **JAMA** 1981 Jul 3;246(1):14
Methods and methodological considerations in measuring anti-anxiety effects of tranquilizing drugs. Debus G, et al. **Prog Neuropsychopharmacol** 1980;4(4–5):391–404
Responders and nonresponders to chlordiazepoxide and placebo: a discriminant function analysis. Downing RW, et al. **Prog Neuropsychopharmacol** 1980;4(4–5):405–15
Preoperative anxiety and its management in orostomatology. Srivastava RP, et al. **Uttar Pradesh State Dent J** 1980 Oct;11(4):167–71

ANXIETY DISORDERS

MAO inhibition and control of anxiety following amitriptyline therapy. A pilot study. Davidson J, et al. **Acta Psychiatr Scand** 1981 Feb; 63(2):147–52
Catecholamines and monoamine oxidase activity in anxiety. Mathew RJ, et al. **Acta Psychiatr Scand** 1981 Mar;63(3):245–52
Antidepressants: old drugs, new uses. Harris E. **Am J Nurs** 1981 Jul; 81(7):1308–9
Clobazam and diazepam in anxiety. Rickels K, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):95–100
Relapse after short-term drug therapy in neurotic outpatients. Rickels K, et al. **Int Pharmacopsychiatry** 1980;15(3):186–92
Double-blind comparison of ketazolam and placebo using once-a-day dosing. Cohn JB, et al. **J Clin Pharmacol** 1980 Nov–Dec; 20(11–12):676–80
Double-blind clinical assessment of alprazolam, a new benzodiazepine derivative, in the treatment of moderate to severe anxiety. Greiss KC, et al. **J Clin Pharmacol** 1980 Nov–Dec;20(11–12):693–9
A comparison of prazepam, diazepam, lorazepam and placebo in anxious outpatients in non-psychiatric private practices. Zung WW, et al. **J Clin Psychiatry** 1981 Jul;42(7):280–4
Comparison of the therapeutic effect, tolerance and safety of ketazolam and diazepam administered for six months to out-patients with chronic anxiety neurosis. Fabre LF, et al. **J Int Med Res** 1981;9(3):191–8
New studies confirm MAO inhibitors' efficacy in treating severe anxiety [news] González ER. **JAMA** 1981 May 8;245(18):1799–801
[A double blind trial : oxprenolol/diazepam (author's transl)] Scharbach H. **Encephale** 1981;7(1):51–8 (Eng. Abstr.) **(Fre)**
[Treatment of chronic anxiety by behaviour therapy and with beta-blocking agents - an empirical study (author's transl)] Butollo W. **Psychother Psychosom Med Psychol** 1981 Mar;31(2):53–7 (Eng. Abstr.) **(Ger)**

APOMORPHINE

Resumption of prolactin secretion after dopaminergic inhibition: differential effects of dopamine and its agonists. Woolf PD. **Am J Physiol** 1981 Jun;240(6):E700–4
Avoidance learning and mechanism of the protective effect of apomorphine against hypoxia. Boismare F, et al. **Aviat Space Environ Med** 1981 May;52(5):299–303
hypobaric hypoxia: central catecholamine levels and cortical PO2 and avoidance response in rats treated with apomorphine. Saligaut C, et al. **Aviat Space Environ Med** 1981 Mar;52(3):166–70
The effects of chloral hydrate anesthesia on the metabolic response in the substantia nigra to apomorphine. Grome JJ, et al. **Brain Res** 1981 Jun 9;214(1):223–8
Effect of apomorphine hydrochloride administration on serum concentrations of prolactin and growth hormone in cattle. Gorewit RC. **Experientia** 1981 Feb 15;37(2):204–6
Estrogen potentiates the stereotypy induced by dopamine agonists in the rat. Chiodo LA, et al. **Life Sci** 1981 Feb 16;28(7):827–35
Blink rates and receptor supersensitivity. Karson CN, et al. **Neuropharmacology** 1981 Jan;20(1):91–3
Apomorphine-induced circling behaviour in hamsters following unilateral injection of scrapie gent in the striatum. Gorde JM, et al. **Neurosci Lett** 1981 Mar 10;22(2):201–4
Different effects of apomorphine on locomotor activity in C57BL/6 and DBA/2 mice. Sansone M, et al. **Pharmacol Biochem Behav** 1981 May; 14(5):741–3
Pharmacokinetic study of apomorphine-induced stereotypy in food deprived rats. Watanabe H, et al. **Pharmacol Biochem Behav** 1981 Apr; 14(4):493–6
Use of the intracerebral injection technique to elucidate mechanisms of apomorphine climbing and its antagonism in the mouse. Costall B, et al. **Psychopharmacology (Berlin)** 1981;73(1):91–4
Repeated electroconvulsive shock prevents the sedative effect of small doses of apomorphine. Serra G, et al. **Psychopharmacology (Berlin)** 1981; 73(2):194–6
The effects of electroconvulsive shock on the discriminative stimulus properties of d-amphetamine and apomorphine: evidence for dopamine receptor alteration subsequent ECS. White DK, et al. **Psychopharmacology (Berlin)** 1981;73(3):211–4
[Evaluation of motor behavior in conditions of hyperprolactinemia] Rampello L, et al. **Acta Neurol (Napoli)** 1981 Feb;36(1):297–301 (Eng. Abstr.) **(Ita)**
[Diphasic action of apomorphine on motility in the rat. II. Time aspects of the effect of a single dose] Vaccheri A, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):381–6 (Eng. Abstr.) **(Ita)**
[Diphasic action of apomorphine on motility of the rat. I. Dose-effect relationship in exploratory and basal motility] Vaccheri A, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):374–80 (Eng. Abstr.) **(Ita)**

APPETITE

Cholecystokinin acts on the hypothalamic 'noradrenergic system' involved in feeding. McCaleb ML, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):47–9
[Effect of adrenergic beta-receptor blockers on the oxygen consumption or narcotized rats and the calorigenic action of adrenaline] Ankermann H. **Acta Biol Med Ger** 1980;39(11–12):1227–34 (Eng. Abstr.) **(Ger)**

AROMATIC AMINO ACID DECARBOXYLASES

New and highly sensitive assay for L-5-hydroxytryptophan decarboxylase activity by high-performance liquid chromatography-voltammetry. Rahman MK. et al. **J Chromatogr** 1980 Dec 12;221(2):265-70

The interaction of 2,3,4-trihydroxybenzylhydrazine with DOPA decarboxylase from pig kidney. Borri Voltattorni C, et al. **Life Sci** 1981 Jan 5;28(1):103-8

AROUSAL

Cardiovascular and sympathetic responses to PGF2 alpha injection into hypothalamic nuclei. Feuerstein G, et al. **Brain Res Bull** 1981 Mar; 6(3):203-7

Effect of methylphenidate on young adult's vigilance and event-related potentials. Coons HW, et al. **Electroencephalogr Clin Neurophysiol** 1981 Apr;51(4):373-87

ATTENTION

Effect of methylphenidate on young adult's vigilance and event-related potentials. Coons HW, et al. **Electroencephalogr Clin Neurophysiol** 1981 Apr;51(4):373-87

Residual attentional deficits in adolescents. Clampit MK. **J Learn Disabil** 1981 Apr;14(4):218-9

A simple system for control of the continuous performance test in psychopharmacological research. Aman MC, et al. **Prog Neuropsychopharmacol** 1980;4(6):621-6

Dopaminergic involvement in attention. A novel animal model. Katz RJ, et al. **Prog Neuropsychopharmacol** 1980;4(6):585-90

AUTISM

Serum serotonin, free tryptophan and plasma cyclic AMP levels in autistic children -with special reference to their relation to hyperkinesia. Hoshino Y, et al. **Fukushima J Med Sci** 1979;26(3-4):79-91

AUTISM, INFANTILE

Folic acid and B12 in autism and neuropsychiatric disturbances of childhood. Lowe TL, et al. **J Am Acad Child Psychiatry** 1981 Winter; 20(1):104-11

AVOIDANCE LEARNING

Avoidance learning and mechanism of the protective effect of apomorphine against hypoxia. Boismare F, et al. **Aviat Space Environ Med** 1981 May;52(5):299-303

hypobaric hypoxia: central catecholamine levels and cortical PO2 and avoidance response in rats treated with apomorphine. Saligaut C, et al. **Aviat Space Environ Med** 1981 Mar;52(3):166-70

Hippocampal lesion effects on conditioned taste aversion and pituitary-adrenal activity in rats. Smotherman WP, et al. **Behav Brain Res** 1981 Jan;2(1):33-48

Behavioral activity of met-enkephalin and ACTH4-10 and other peptides containing a phenylalanine and methionine residue. Rigter H, et al. **Biochem Biophys Res Commun** 1981 Jan 30;98(2):424-30

L-dopa enhances acquisition of an inhibitory avoidance response. Martinez JL Jr, et al. **Commun Psychopharmacol** 1980;4(3):215-8

Conditioned social aversion in the male Mongolian gerbil (Meriónes unguiculatus). Pettijohn TF. **J Comp Physiol Psychol** 1981 Apr; 95(2):228-39

Aversion to the reinforcer differentially affects conditioned reinforcement and instrumental responding. Wilson CL, et al. **J Exp Psychol [Anim Behav]** 1981 Apr;7(2):165-74

Effects of N-substituted analogs and metabolites of phencyclidine on avoidance behavior in the rat. Shannon HE, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):55-62

Adrenal steroids and extinction behavior: antagonism by progesterone, deoxycorticosterone and dexamethasone of a specific effect of corticosterone. Bohus B, et al. **Life Sci** 1981 Jan 26;28(4):433-40

Passive avoidance performance correlates with catecholamine turnover in discrete limbic brain regions. Kovács GL, et al. **Life Sci** 1981 Mar 9;28(10):1109-16

Retention of passive avoidance behavior in rats following alpha- and gamma-endorphin administration: effects of post-learning treatments. Kovács GL, et al. **Neurosci Lett** 1981 Feb 23;22(1):79-82

The effect of para-chlorophenylalanine and scopolamine on passive avoidance in chicks. Mattingly BA, et al. **Pharmacol Biochem Behav** 1981 May;14(5):669-76

Effects of chlorpromazine on escape and avoidance responses: a closer look. Spirduso WW, et al. **Pharmacol Biochem Behav** 1981 Apr; 14(4):433-8

Septal lesions and avoidance behavior: genetic, neurochemical and behavioral considerations. Donovick PJ, et al. **Physiol Behav** 1981 Mar; 26(3):495-507

Effects of desglycinamide-lysine vasopressin on a conditioned taste aversion in rats. Vawter MP, et al. **Physiol Behav** 1980 Dec; 25(6):851-4

Effects of dorsolateral tegmental lesions on amphetamine- and lithium-induced taste aversions. Wellman PJ, et al. **Physiol Behav** 1981 Feb;26(2):341-4

Studies on the role of serotonin in avoidance learning [proceedings] Ogren SO. **Psychopharmacol Bull** 1981 Jan;17(1):17-9

Changes in action of tricyclic and tetracyclic antidepressants: desipramine and mianserin, on avoidance behavior in the course of the chronic treatment. Hano J, et al. **Psychopharmacology (Berlin)** 1981; 73(3):265-8

Lesion of serotonergic neurons antagonizes clonidine induced suppression of avoidance behavior and locomotor activity in rats. Kostowski W, et al. **Psychopharmacology (Berlin)** 1981;73(3):261-4

[Hypobaric hypoxia effects on a conditioned avoidance response and on ADP, AMP dopamine and noradrenaline cerebral levels in rats treated or not with naftidrofuryl (author's transl)] Boismare F, et al. **J Pharmacol** 1981 Jan-Mar;12(1):51-7 (Eng. Abstr.) **(Fre)**

[1,6-Disubstituted 3-methylquinoxalin-2(1H)-ones. Effect on acquisition and modification of a conditioned avoidance response in the rat] Alamanni MC, et al. **Farmaco [Sci]** 1981 May;36(5):359-71 (Eng. Abstr.) **(Ita)**

[Formation and preservation of conditioned taste aversion in dogs] Vavilova NM, et al. **Zh Vyssh Nerv Deiat** 1981 Jan-Feb;31(1):171-2 **(Rus)**

BEHAVIOR

Specific norepinephrine and serotonin uptake inhibitors in man: a crossover study with pharmacokinetic, biochemical, neuroendocrine and behavioral parameters. Potter WZ, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):152-65

Effects of lithium carbonate on methylphenidate-induced mood, behavior, and cognitive processes. Huey LY, et al. **Psychopharmacology (Berlin)** 1981;73(2):161-4

EEG and behavioral effects of pirenzepine in normal volunteers. Fink M, et al. **Scand J Gastroenterol [Suppl]** 1980;15(66):39-46

BEHAVIOR, ANIMAL

Biochemical specificity of septal hyperreactivity: a behavioral discrimination. Chafetz MD, et al. **Behav Brain Res** 1981 May; 2(3):409-20

Behavioral supersensitivity to methamphetamine following chronic treatment with (—)-sulpiride in the rat. Montanaro N, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):401-6

Behavioral effects of opiates: a pharmacogenetic analysis. Oliverio A, et al. **Curr Dev Psychopharmcol** 1981;6:45-64 (78 ref.)

Behavioral and neurochemical effects of neonatal administration of monosodium L-glutamate in mice. Dawson R Jr, et al. **J Comp Physiol Psychol** 1981 Feb;95(1):71-84

Role of monoamines in behavior of reserpinized rats given tranylcypromine stereoisomers. Smith DF. **J Neural Transm** 1981; 50(2-4):193-200

Unexpected differences between mazindol and its homologs on biochemical and behavioral responses. Heikkila RE, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):745-9

Prenatal exposure to imipramine alters early behavioral development and beta adrenergic receptors in rats. Jason KM, et al. **J Pharmacol Exp Ther** 1981 May;217(2):461-6

Neostriatal dopamine receptor loss and behavioral deficits in the senescent rat. Cubells JF, et al. **Life Sci** 1981 Mar 16;28(11):1215-8

Individual differences in effects of tricyclic antidepressants and anticholinergic drugs on operant behavior in the squirrel monkey. McKearney JW. **Life Sci** 1981 May 4;28(18):2049-54

Dorsal tegmental bundle destruction: effects on operant behavior, brain catecholamine levels, and behavioral suppression produced by adrenergic agonists. Morris MD, et al. **Life Sci** 1980 Dec 22-29; 27(25-26):2621-6

Neurotensin blocks certain amphetamine-induced behaviours. Ervin GN, et al. **Nature** 1981 May 7;291(5810):73-6

Nigral-derived muscimol circling—ipsiversive, contraversive or controversial? [letter] Starr MS, et al. **Nature** 1981 Apr 16; 290(5807):610

Differential electrophysiological and behavioral responses to optically active derivatives of phencyclidine. Marwaha J, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Jan;315(3):203-9

The Yawning elicited by alpha-melanocyte-stimulating hormone involves serotonergic-dopaminergic-cholinergic neuron link in rats. Yamada K, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr; 316(2):155-60

Phenytoin: plasma levels and behavioral changes associated with suppression of auditory evoked potentials in the cat. Faingold CL, et al. **Neuropharmacology** 1981 May;20(5):445-9

Behavioural, ECoG spectrum power and body temperature effects of BW 245C, a prostaglandin analogue after intraventricular microinjection in chicks. Rotiroti D, et al. **Neuropharmacology** 1981 May;20(5):517-20

Dopaminergic mediation of reward: evidence gained using a natural reinforcer in a behavioral contrast paradigm. Royall DR, et al. **Neurosci Lett** 1981 Jan 20;21(2):223–9

Influence of substance P on the behavioral changes induced by haloperidol in rats. Jolicoeur FB, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):103–7

DOM and related 2,5–dimethoxy–4–alkylphenylisopropylamines: behavioral and serotonin receptor properties. Glennon RA, et al. **Pharmacol Biochem Behav** 1981 Mar;14(3):287–92

Pharmaco–ethological analysis of social behaviour of isolated mice. Poshivalov VP. **Pharmacol Biochem Behav** 1981;14 Suppl 1:53–9

Tryptophan deprivation: effects on mouse–killing and reactivity in the rat. Vergnes M, et al. **Pharmacol Biochem Behav** 1981; 14 Suppl 1:19–23

Lack of specificity of an animal behavior model for hallucinogenic drug action. White FJ, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):339–43

Role of the pulvinar–lateral posterior nucleus complex in turning behavior. Motles E, et al. **Physiol Behav** 1980 Dec;25(6):921–9

Intracellular injection of t he catalytic subunit of cyclic AMP–dependent protein kinase simulates facilitation of transmitter release underlying behavioral sensitization in Aplysia. Castellucci VF, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7492–6

Drug regimens facilitating aggression: behavior, amine, and receptor alterations [proceedings] Eichelman B. **Psychopharmacol Bull** 1981 Jan; 17(1):58–60

Discussion of paper by Dr. Klaus Miczek [proceedings] McKinney WT Jr. **Psychopharmacol Bull** 1981 Jan;17(1):62–3

Pharmacological evidence for catecholamine involvement in animal aggression [proceedings] Miczek KA. **Psychopharmacol Bull** 1981 Jan; 17(1):60–2

Effects of single and long–term haloperidol administration on open field behavior of rats. Bernardi MM, et al. **Psychopharmacology (Berlin)** 1981; 73(2):171–5

Pharmacologic manipulations of brain catecholamines and the behavior of Callithrix jacchus (marmoset). Campos F, et al. **Psychopharmacology (Berlin)** 1981;73(3):252–6

Effects of chlorpromazine on food–maintained and observing behavior. Dearing ME, et al. **Psychopharmacology (Berlin)** 1981;73(3):281–5

Effects of neonatal 6–hydroxydopamine treatment on catecholamine levels and behavior during development and adulthood. Fobes JL, et al. **Psychopharmacology (Berlin)** 1981;73(1):27–30

Use of 6–hydroxydopamine to deplete brain catecholamines in the rhesus monkey: effects on urinary catecholamine metabolites and behavior. Kraemer GW, et al. **Psychopharmacology (Berlin)** 1981;73(1):1–11

Effect of 5,7–dihydroxytryptamine on serotonergic control of prolactin secretion and behavior in rats. Kuhn CM, et al. **Psychopharmacology (Berlin)** 1981;73(2):188–93

Behavioral and biochemical studies of the scopolamine–induced reversal of neuroleptic activity. Ondrusek MG, et al. **Psychopharmacology (Berlin)** 1981;73(1):17–22

Peripheral correlates of serotonergically–influenced behaviors in vervet monkeys (Cercopithecus aethiops sabaeus). Raleigh MJ, et al. **Psychopharmacology (Berlin)** 1981;72(3):241–6

Effects of lithium on behavioral reactivity: relation to increases in brain cholinergic activity. Russell RW, et al. **Psychopharmacology (Berlin)** 1981;73(2):120–5

Two distinct central serotonin receptors with different physiological functions. Peroutka SJ, et al. **Science** 1981 May 15;212(4496):827–9

[Evaluation of motor behavior in conditions of hyperprolactinemia] Rampello L, et al. **Acta Neurol (Napoli)** 1981 Feb;36(1):297–301 (Eng. Abstr.) **(Ita)**

[Diphasic action of apomorphine on motility of the rat. I. Dose–effect relationship in exploratory and basal motility] Vaccheri A, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):374–80 (Eng. Abstr.) **(Ita)**

[Diphasic action of apomorphine on motility in the rat. II. Time aspects of the effect of a single dose] Vaccheri A, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):381–6 (Eng. Abstr.) **(Ita)**

[Catecholamines in the brain structures of rats responding differently to the 'open field' test] Belova TI, et al. **Biull Eksp Biol Med** 1981 Feb; 91(2):136–8 (Eng. Abstr.) **(Rus)**

BENACTYZINE

[Certain biochemical and behavioral effects of morphine in rats following amyzil administration] Bandman AL, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):185–8 (Eng. Abstr.) **(Rus)**

BENZAZEPINES

Facilitation of Neuromuscular transmission by calcium antagonists, diltiazem, nifedipine and verapamil, in the dog. Sato T, et al. **Arch Int Pharmacodyn Ther** 1981 Feb;249(2):235–46

Inhibitory action of calcium antagonists on ATP–dependent calcium uptake by the renal cortical microsomes. Dan T, et al. **Jpn J Pharmacol** 1980 Dec;30(6):913–7

[Effects of diltiazem on hemodynamics and His bundle electrogram in the anesthetized dog (author's transl)] Nagao T, et al. **Nippon Yakurigaku Zasshi** 1981 Feb;77(2):195–203 (Eng. Abstr.)**(Jpn)**

BENZODIAZEPINE TRANQUILIZERS

The benzodiazepine––GABA––chloride ionophore receptor complex: common site of minor tranquilizer action. Paul SM, et al. **Biol Psychiatry** 1981 Mar;16(3):213–29

Quantitative analysis of CM 6912 (ethyl loflazepate) and its metabolites in plasma and urine by chemical ionization gas chromatography mass spectrometry. Application to pharmacokinetic studies in man. Cautreels W, et al. **Biomed Mass Spectrom** 1980 Nov;7(11–12):565–71

Dependence on benzodiazepines. Tyrer P. **Br J Psychiatry** 1980 Dec; 137:576–7

Chlormethiazole and temazepam [letter] **Br Med J [Clin Res]** 1981 Mar 7;282(6266):825

Effect of maternal lorazepam on the neonate [letter] Johnstone M. **Br Med J [Clin Res]** 1981 Jun 13;282(6280):1973–4

Withdrawal reaction from clobazam. Petursson H, et al. **Br Med J [Clin Res]** 1981 Jun 13;282(6280):1931–2

Addiction to temazepam. Ratna L. **Br Med J [Clin Res]** 1981 Jun 6; 282(6279):1837–8

Regional release of [3H]adenosine derivatives from rat brain in vivo: effect of excitatory amino acids, opiate agonists, and benzodiazepines. Jhamandas K, et al. **Can J Physiol Pharmacol** 1980 Nov; 58(11):1262–78

Effects of uremia and hemodialysis on lormetazepam disposition. Kampf D, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):77–85

Clobazam and diazepam in anxiety. Rickels K, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):95–100

Temazepam: a review of its pharmacological properties and therapeutic efficacy as an hypnotic. Heel RC, et al. **Drugs** 1981 May; 21(5):321–40 (69 ref.)

gamma–Aminobutyric acid regulation of the benzodiazepine receptor: biochemical evidence for pharmacologically different effects of benzodiazepines and propyl beta–carboline–3–carboxylate. Ehlert FJ, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):593–5

Determination of benzodiazepines by derivative spectroscopy. Martínez D, et al. **J Anal Toxicol** 1981 Jan–Feb;5(1):10–3

Plasma concentrations of temazepam, a 3–hydroxy benzodiazepine, determined by electron–capture gas–liquid chromatography. Divoll M, et al. **J Chromatogr** 1981 Jan 2;222(1):125–8

Determination of bromazepam by gas–liquid chromatography and its application for pharmacokinetic studies in man. Klotz U. **J Chromatogr** 1981 Mar 13;222(3):501–6

Double–blind comparison of ketazolam and placebo using once–a–day dosing. Cohn JB, et al. **J Clin Pharmacol** 1980 Nov–Dec; 20(11–12):676–80

Double–blind clinical assessment of alprazolam, a new benzodiazepine derivative, in the treatment of moderate to severe anxiety. Greiss KC, et al. **J Clin Pharmacol** 1980 Nov–Dec;20(11–12):693–9

A comparison of prazepam, diazepam, lorazepam and placebo in anxious outpatients in non–psychiatric private practices. Zung WW, et al. **J Clin Psychiatry** 1981 Jul;42(7):280–4

Comparison of the therapeutic effect, tolerance and safety of ketazolam and diazepam administered for six months to out–patients with chronic anxiety neurosis. Fabre LF, et al. **J Int Med Res** 1981;9(3):191–8

The effect of bromazepam on psychomotor activity and subjective mood. Hobi V, et al. **J Int Med Res** 1981;9(2):89–97

Benzodiazepine withdrawal symptoms and propranolol. Tyrer P, et al. **Lancet** 1981 Mar 7;1(8219):520–2

Modulation by picrotoxin and IPTBO of 3H–flunitrazepam binding to the GABA/benzodiazepine receptor complex of rat cerebellum. Karobath M, et al. **Life Sci** 1981 Jan 19;28(3):307–13

Affinity of beta–carbolines on rat brain benzodiazepine and opiate binding sites. Airaksinen MM, et al. **Med Biol** 1980 Dec;58(6):341–4

Instinctive predatory behavior of mustelids (Mustela putorius f. furo, Mustela vison f. dom.) modified by benzodiazepine derivatives. Apfelbach R. **Pharmacol Biochem Behav** 1981;14 Suppl 1:43–6

Increase in 3H–flunitrazepam binding in vitro and in vivo to rat brain benzodiazepine receptors by tofizopam, a 3,4–benzo–diazepine. Saano V, et al. **Pharmacol Res Commun** 1981 Jan;13(1):75–85

gamma–Aminobutyric acid and benzodiazepine receptors: copurification and characterization. Gavish M, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1939–42

Autoradiographic localization of benzodiazepine receptors in immunocytochemically identified gamma–aminobutyrergic synapses. Möhler H, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1935–8

Rapid development of tolerance to the sedative effects of lorazepam and triazolam in rats. File SE. **Psychopharmacology (Berlin)** 1981; 73(3):240–5

[The Halcion affair (letter)] Mostert JW. **S Afr Med J** 1981 Jun 27; 59(27):967 **(Afr)**

Clinical trial of halazepam and clorazepate: considerations of a single bedtime dose [proceedings] Cohen NL, et al. **Psychopharmacol Bull** 1981 Jan;17(1):134–5 **(eng)**

[Unusual withdrawal symptoms after long–term administration of benzodiazepines (author's transl)] Schöpf J. **Nervenarzt** 1981 May; 52(5):288–92 (Ger)

BENZODIAZEPINONES

Absorption, distribution and excretion of 14C–pirenzepine in rats. Accumulation characteristics after multiple dose regimen. Kobayashi S, et al. **Arzneimittelforsch** 1981;31(4):679–90

Quantitative analysis of CM 6912 (ethyl loflazepate) and its metabolites in plasma and urine by chemical ionization gas chromatography mass spectrometry. Application to pharmacokinetic studies in man. Cautreels W, et al. **Biomed Mass Spectrom** 1980 Nov;7(11–12):565–71

Withdrawal reaction from clobazam. Petursson H, et al. **Br Med J [Clin Res]** 1981 Jun 13;282(6280):1931–2

Benzodiazepines prevent kainate–induced loss of GABAergic and cholinergic neurons in the chick retina. Imperato A, et al. **Brain Res** 1981 May 25;213(1):205–10

Clobazam and diazepam in anxiety. Rickels K, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):95–100

Specific high–affinity saturable binding of [3H] R05–4864 to benzodiazepine binding sites in the rat cerebral cortex. Schoemaker H, et al. **Eur J Pharmacol** 1981 Apr 24;71(1):173–5

Inhibition of carbonic anhydrase by pirenzepine. Puşcaş I, et al. **Int J Clin Pharmacol Ther Toxicol** 1981 Feb;19(2):75–7

Gas chromatographic determination of clonazepam. Larking P. **J Chromatogr** 1980 Dec 12;221(2):399–402

Double–blind comparison of ketazolam and placebo using once–a–day dosing. Cohn JB, et al. **J Clin Pharmacol** 1980 Nov–Dec; 20(11–12):676–80

Comparison of the therapeutic effect, tolerance and safety of ketazolam and diazepam administered for six months to out–patients with chronic anxiety neurosis. Fabre LF, et al. **J Int Med Res** 1981;9(3):191–8

Chemical conversion of anthramycin 11–methyl ether to didehydroanhydroanthramycin and its utilization in studies of the biosynthesis and mechanism of action of anthramycin. Malhotra RK, et al. **J Nat Prod** 1981 Jan–Feb;44(1):38–44

Investigation in man of the efficacy of a benzodiazepine antagonist, Ro 15–1788. Darragh A, et al. **Lancet** 1981 Jul 4;2(8236):8–10

In vivo effects of two novel alkylating benzodiazepines, irazepine and kenazepine. Williams EF, et al. **Pharmacol Biochem Behav** 1981 Apr; 14(4):487–91

Advances in basic and clinical pharmacology of pirenzepine. Proceedings of the Second International Symposium on Pirenzepine. Hamburg, FRG, 8 June 1980. **Scand J Gastroenterol [Suppl]** 1980;15(66):1–114

Pirenzepine––a ligand with original binding properties to muscarinic receptors. Birdsall NJ, et al. **Scand J Gastroenterol [Suppl]** 1980; 15(66):1–4

An international pharmacokinetic study on pirenzepine following a single oral dose. Bozler G, et al. **Scand J Gastroenterol [Suppl]** 1980; 15(66):27–33

EEG and behavioral effects of pirenzepine in normal volunteers. Fink M, et al. **Scand J Gastroenterol [Suppl]** 1980;15(66):39–46

Effects of cimetidine and pirenzepine on peroperative electrical vagal stimulation of gastric acid secretion. Fritsch WP, et al. **Scand J Gastroenterol [Suppl]** 1980;15(66):95–100

Pirenzepine selectively inhibits gastric acid secretion: a comparative pharmacological study between pirenzepine and seven other antiacetylcholine drugs. Heathcote BV, et al. **Scand J Gastroenterol [Suppl]** 1980;15(66):15–26

Comparison of the action of pirenzepine and L–hyoscyamine on gastric acid secretion and other muscarinic effects. Jaup BH, et al. **Scand J Gastroenterol [Suppl]** 1980;15(66):89–94

Cerebro–spinal fluid concentrations of pirenzepine after therapeutic dosage. Jaup BH, et al. **Scand J Gastroenterol [Suppl]** 1980; 15(66):35–7

Psychometric studies of pirenzepine. Kuhn E, et al. **Scand J Gastroenterol [Suppl]** 1980;15(66):47–53

The effect of pirenzepine on meal–stimulated gastrointestinal hormones. El–Sabbagh HN, et al. **Scand J Gastroenterol [Suppl]** 1980; 15(66):57–61

Influence of intravenous pirenzepine on gastric acid and pepsin in man. el–Sabbagh HN, et al. **Scand J Gastroenterol [Suppl]** 1980; 15(66):73–7

Clinical trial of halazepam and clorazepate: considerations of a single bedtime dose [proceedings] Cohen NL, et al. **Psychopharmacol Bull** 1981 Jan;17(1):134–5 (eng)

[The effect of clonazepam on visual evoked potentials of the rabbit (author's transl)] Pockberger H, et al. **EEG EMG** 1981 Mar; 12(1):14–20 (Eng. Abstr.) (Ger)

BIOGENIC AMINES

Immunohistochemical characterization of monoamine–containing neurons in the central nervous system by antibodies to serotonin and noradrenalin. A study in the rat and the lamprey (Lampetra fluviatilis). Steinbusch HW, et al. **Acta Histochem [Suppl] (Jena)** 1981;24:107–22

Biogenic amines and depression (introduction to symposium). Agurell S. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):17–9

High–performance liquid chromatographic determination of four biogenic amines in chocolate. Hurst WJ, et al. **Analyst** 1981 Apr; 106(1261):394–402

Endosymbionts, biogenic amines, and a heterodyne hypothesis for circadian rhythms. Levandowsky M. **Ann NY Acad Sci** 1981; 361:369–75

The deamination of monoamines by pig dental pulp. Norqvist A, et al. **Biochem Pharmacol** 1981 Mar 1;30(5):403–9

Studies related to the blood–brain barrier to monoamines and protein in pia–arachnoid cultures. Hervonen H, et al. **Brain Res** 1981 Apr 6; 210(1–2):449–54

Sulphate conjugation of biologically active monoamines and their metabolites by human platelet phenolsulphotransferase. Rein G, et al. **Clin Chim Acta** 1981 Apr 9;111(2–3):247–56

Stereospecific transport carrier systems for L–tyrosine and L–tryptophan in relation to monoamine synthesis. Bruinvels J, et al. **Essays Neurochem Neuropharmacol** 1981;5:1–24 (33 ref.)

Chromatographic separation of some biogenic amines on a weakly acidic ion–exchange resin. Seki T. **J Chromatogr** 1981 Mar 20;207(2):286–7

Influence of cholecystokinin octapeptide sulfate ester on brain monoamine metabolism in rats. Fekete M, et al. **J Neural Transm** 1981; 50(2–4):81–8

Decreased transmethylation of biogenic amines after in vivo elevation of brain S–adenosyl–l–homocysteine. Schatz RA, et al. **J Neurochem** 1981 May;36(5):1739–48

An improved approach to histofluorescence using the SPG method for tissue monoamines. De la Torre JC. **J Neurosci Methods** 1980 Oct; 3(1):1–5

Unexpected differences between mazindol and its homologs on biochemical and behavioral responses. Heikkila RE, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):745–9

Effects of reserpine on monoamines and intestinal transit in the rat. Stewart JJ, et al. **J Pharmacol Exp Ther** 1981 May;217(2):357–62

Regional changes of monoamines in cerebral cortex and subcortical structures of aging rhesus monkeys. Goldman–Rakic PS, et al. **Neuroscience** 1981;6(2):177–87

Substituted phenethylamines and anorexia. Duhault J, et al. **Prog Neuropsychopharmacol** 1980;4(4–5):341–9

Immobilization stress in rats: effect on rectal temperature and possible role of brain monoamines in hypothermia. Amar A, et al. **Psychopharmacology (Berlin)** 1981;73(2):157–60

[Modifications of cerebral amine metabolism in psychiatric illness] Linkowski P, et al. **Acta Psychiatr Belg** 1980 Sep–Oct;80(5):559–73 (38 ref.) (Fre)

[Convergence and reciprocal coupling of hypothalamic monoaminergic and peptidergic neurons (author's transl)] Barry J. **Ann Endocrinol (Paris)** 1980 Nov–Dec;41(6):457–65 (Eng. Abstr.) (Fre)

[Oxidative deamination data on biogenic monoamines in the mitochondrial fraction of rat brain and liver] Sarukhanian ZhG, et al. **Gig Tr Prof Zabol** 1981 Apr;(4):30–3 (Eng. Abstr.) (Rus)

BIPOLAR DISORDER

Estimates of the prevalence of bipolar affective disorder. Methods based on treatment with lithium. Eastwood R, et al. **Acta Psychiatr Scand** 1981 Jan;63(1):83–90

Adolescents at risk for manic–depressive illness. Kestenbaum CJ. **Adolesc Psychiatry** 1980;8:344–66

Effects of lithium on memory. Christodoulou GN, et al. **Am J Psychiatry** 1981 Jun;138(6):847–8

Effect of lithium on glycine levels in patients with affective disorders. Deutsch SI, et al. **Am J Psychiatry** 1981 May;138(5):683–4

The effect of mianserin on urinary catecholamine excretion in psychiatric patients. Moody JP, et al. **Br J Clin Pharmacol** 1981 Jan; 11(1):103–5

Bipolar affective psychosis with onset before age 16 years: report of 10 cases. Hassanyeh F, et al. **Br J Psychiatry** 1980 Dec;137:530–9

The lithium clinic for treatment and prevention of manic depression: a cost benefit approach. Fieve RR. **Egypt J Psychiatry** 1979 Oct; 2(2):166–90

Memory processing with lithium carbonate. Marusarz TZ, et al. **J Clin Psychiatry** 1981 May;42(5):190–2

Lithium nephrotoxicity [letter] Johnson GF, et al. **Med J Aust** 1981 Apr 4;1(7):376

Estimation of lithium dose requirement by lithium clearance, serum lithium and saliva lithium following a loading dose of lithium carbonate. Tyrer SP, et al. **Neuropsychobiology** 1981;7(3):152–8

Manic–depressive disorder. Paykel ES, et al. **Practitioner** 1981 Jan; 225(1351):75–7, 79–81

Lithium in children of lithium–responding parents. McKnew DH, et al. **Psychiatry Res** 1981 Apr;4(2):171–80

Slow and rapid onset of manic episodes: implications for underlying biology. Post RM, et al. **Psychiatry Res** 1981 Apr;4(2):229–37

Prophylactic lithium with and without imipramine for bipolar I patients: a double–blind study [proceedings] Kane JM, et al.

Psychopharmacol Bull 1981 Jan;17(1):144–5

Lithium and imipramine in the prophylaxis of unipolar and bipolar II depression: a prospective, placebo–controlled comparison [proceedings] Quitkin FM, et al. **Psychopharmacol Bull** 1981 Jan;17(1):142–4

A preliminary double–blind study on the efficacy of carbamazepine in prophylaxis of manic–depressive illness. Okuma T, et al. **Psychopharmacology (Berlin)** 1981;73(1):95–6

What to watch for with lithium. Rosenberg JM, et al. **RN** 1981 Jul; 44(7):44–6

[Lithium dose in relation to body weight and age in the preventive of relapses in manic–depressive psychosis] König L. **Agressologie** 1980; 21(A):15–7 (Eng. Abstr.) **(Ger)**

[Neurochemistry and clinical psychiatry (author's transl)] Gross G. **Fortschr Neurol Psychiatr** 1981 Jan;49(1):34–42 (Eng. Abstr.) **(Ger)**

BLOOD–BRAIN BARRIER

Studies related to the blood–brain barrier to monoamines and protein in pia–arachnoid cultures. Hervonen H, et al. **Brain Res** 1981 Apr 6; 210(1–2):449–54

Blood–brain barrier for serotonin in the eel (Anguilla anguilla L.). Genot G, et al. **Comp Biochem Physiol** [C] 1981;68C(2):247–50

Medical therapies for mood disorders alter the blood–brain barrier. Preskorn SH, et al. **Science** 1981 Jul 24;213(4506):469–71

BRADYKININ

A comparison of the actions of acetylcholine and bradykinin on the guinea pig ileum. Roberts ML. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):267–70

[Acetylcholine–bradykinin: a new peptide–amine transmitter interaction (editorial)] Pirola CJ. **Medicina (B Aires)** 1980 Nov–Dec; 40(6 Pt 2):893–5 **(Spa)**

BUTAPERAZINE

Neuroleptic–induced decrease in platelet MAO activity of schizophrenic patients. Chojnacki M, et al. **Am J Psychiatry** 1981 Jun; 138(6):838–40

BUTYLAMINES

Studies on the endoanesthetic effects of lidocaine and benzonatate on non–medullated nerve endings in the left ventricle. Thorén P, et al. **Acta Physiol Scand** 1981 Jan;111(1):51–8

BUTYROPHENONE TRANQUILIZERS

A gas chromatographic method for the determination of fluanisone, moperone, aceperone and pipamperone in human plasma. Quaglio MP, et al. **Farmaco [Prat]** 1981 Apr;36(4):204–14

BUTYROPHENONES

The relationship between loss of dopamine nerve terminals, striatal [3H]spiroperidol binding and rotational behavior in unilaterally 6–hydroxydopamine–lesioned rats. Heikkila RE, et al. **Brain Res** 1981 May 4;211(2):285–92

Biochemical mechanism of tolerance to neuroleptic drugs; regional differences in rat brain. Bacopoulos NG. **Eur J Pharmacol** 1981 Apr 9;70(4):585–6

Selective labelling of murine B lymphocytes by [3H]spiroperidol. Uzan A, et al. **J Pharm Pharmacol** 1981 Feb;33(2):102–3

Resolution of dopamine and serotonin receptor components of [3H]spiperone binding to rat brain regions. List SJ, et al. **Proc Natl Acad Sci USA** 1981 Apr;78(4):2620–4

CARBAMAZEPINE

Charcoal hemoperfusion for treatment of carbamazepine poisoning. Chan KM, et al. **Clin Chem** 1981 Jul;27(7):1300–2

Simple and rapid gas–liquid chromatographic method for estimating carbamazepine in serum. Cocks DA, et al. **J Chromatogr** 1981 Mar 13; 222(3):496–500

Rapid gas chromatography method for the determination of carbamazepine and unrearranged carbamazepine–10,11–epoxide in human plasma. Ranise A, et al. **J Chromatogr** 1981 Jan 2; 222(1):120–4

Carbamazepine–induced acute tubulointerstitial nephritis. Hogg RJ, et al. **J Pediatr** 1981 May;98(5):830–2

Induction effect of phenobarbital on the carbamazepine to carbamazepine–10, 11–epoxide pathway in rhesus monkeys. Patel IH, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):555–8

A preliminary double–blind study on the efficacy of carbamazepine in prophylaxis of manic–depressive illness. Okuma T, et al. **Psychopharmacology (Berlin)** 1981;73(1):95–6

Factors influencing simultaneous concentrations of carbamazepine and its epoxide in plasma. McKauge L, et al. **Ther Drug Monit** 1981; 3(1):63–70

GLC analysis of carbamazepine [letter] Perchalski RJ, et al. **Ther Drug Monit** 1980;2(3):289

CATECHOLAMINES

Immunofluorescent and biochemical studies on dopamine–beta–hydroxylase and catecholamines in SIF cells of the superior cervical ganglion. Heym C, et al. **Acta Histochem [Suppl] (Jena)** 1981;24:123–9

Effect of catecholamine on fetal breathing activity in rhesus monkeys. Murata Y, et al. **Am J Obstet Gynecol** 1981 Apr 15;139(8):942–7

Cardiac catecholamine stores after cardiac sympathectomy, 6–OHDA, and cardiac denervation. Priola DV, et al. **Am J Physiol** 1981 Jun; 240(6):H889–95

Role of calmodulin in states of altered catecholamine sensitivity. Gnegy ME, et al. **Ann NY Acad Sci** 1980;356:304–18

Onset and magnitude of cardiovascular response to dobutamine and AR–L 115 BS, a new positive inotropic agent with additional vasodilating activity, in normal subjects. Benedikter L, et al. **Arzneimittelforsch** 1981; 31(1a):239–42

hypobaric hypoxia: central catecholamine levels and cortical PO2 and avoidance response in rats treated with apomorphine. Saligaut C, et al. **Aviat Space Environ Med** 1981 Mar;52(3):166–70

Catecholamines and the brain microsomal Na, K–adenosinetriphosphatase—II. The mechanism of action. Svoboda P, et al. **Biochem Pharmacol** 1981 Mar 1;30(5):433–9

Catecholamine synthesis in the adrenal medulla of cattle and rats deficient in copper. Hesketh JE. **Biochem Soc Trans** 1981 Feb;9(1):101–2

Cyclic nucleotides of canine antral smooth muscle. Effects of acetylcholine, catecholamines and gastrin. Baur S, et al. **Biochim Biophys Acta** 1981 Jan 7;672(1):1–6

Hemodynamic responses of the pelvic vascular bed to vasoactive stimuli in pregnant sheep. Tabsh K, et al. **Biol Neonate** 1981;39(1–2):52–60

A method for the analysis of catecholamines by selected ion monitoring and 14C isotope dilution in adrenal medullary cell culture. Lhuguenot JC, et al. **Biomed Mass Spectrom** 1980 Nov;7(11–12):529–32

The effect of mianserin on urinary catecholamine excretion in psychiatric patients. Moody JP, et al. **Br J Clin Pharmacol** 1981 Jan; 11(1):103–5

Correlation between catecholamine secretion from bovine isolated chromaffin cells and [3H]–ouabain binding to plasma membranes. Aunis D, et al. **Br J Pharmacol** 1981 Jan;72(1):31–40

Further evidence for the involvement of Na+ channels in the release of adrenal catecholamine: the effect of scorpion venom and grayanotoxin I. Ito S, et al. **Br J Pharmacol** 1981 Jan;72(1):61–7

Exocytotic secretion of catecholamines from the cat adrenal medulla by sodium deprivation: involvement of calcium influx mechanism. Nishimura S, et al. **Br J Pharmacol** 1981 Feb;72(2):305–17

Liberation of catecholamines from blood platelets. Pletscher A. **Br J Pharmacol** 1981 Feb;72(2):349–54

Catecholamine synthesis regulation in hypothalamic synaptosomes. Haycock DA, et al. **Brain Res** 1981 Jun 15;214(2):371–85

Possible occurrence of Na+–dependent Ca2+ influx mechanism in isolated bovine chromaffin cells. Sorimachi M, et al. **Brain Res** 1981 Mar 16;208(2):442–6

Serotonin–immunoreactive cells in the superior cervical ganglion of the rat. Evidence for the existence of separate serotonin– and catecholamine–containing small ganglionic cells. Verhofstad AA, et al. **Brain Res** 1981 May 11;212(1):39–49

Pressor responses and adrenomedullary catecholamine release during brain stimulation in the rat. Gauthier P. **Can J Physiol Pharmacol** 1981 May; 59(5):485–92

Reflexly induced inhibition of catecholamine release through a peripheral muscarinic mechanism. Lavallée M, et al. **Can J Physiol Pharmacol** 1980 Nov;58(11):1334–41

Correlative ontogenetic development of catecholamine– and LHRH–containing nerve endings in the median eminence of the rat. Ibata Y, et al. **Cell Tissue Res** 1981;216(1):31–8

The influence of vagal afferents on the left ventricular contractile response to intracoronary administration of catecholamines in the conscious dog. Barron KW, et al. **Circ Res** 1981 Jul;49(1):159–69

The effect of charcoal hemoperfusion on the catecholamine levels in severely intoxicated patients. Verpooten GA, et al. **Clin Toxicol** 1981 Feb;18(2):127–31

Dobutamine in the rejecting transplanted heart. Edwards H, et al. **Crit Care Med** 1981 Jun;9(6):498–9

Dobutamine: a hemodynamic evaluation in human septic shock. Jardin F, et al. **Crit Care Med** 1981 Apr;9(4):329–32

The role of catecholamines in the control of gastrin and acid secretion during insulin hypoglycaemia in man. Järhult J, et al. **Digestion** 1981; 21(2):92–7

Preovulatory depletion of ovarian catecholamines in the rat. Bahr JM, et al. **Endocrinology** 1981 May;108(5):1815–20

Catecholamine turnover rates in discrete hypothalamic areas and associated changes in median eminence luteinizing hormone–releasing hormone and serum gonadotropins on proestrus and diestrous day 1.

Rance N, et al. **Endocrinology** 1981 May;108(5):1795–802

The lateral and medial median eminence: distribution of dopamine, norepinephrine, and luteinizing hormone-releasing hormone and the effect of prolactin on catecholamine turnover. Selmanoff M. **Endocrinology** 1981 May;108(5):1716–22

Testicular cyclic nucleotide and adrenal catecholamine metabolism following chronic exposure to cadmium. Singhal RL. **Environ Health Perspect** 1981 Apr;38:111–7

Plasma catecholamines in rats exposed to cold: effects of ganglionic and adrenoreceptor blockade. Picotti GB, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):321–9

The effect of catecholamines and their inhibitors on the solubilized adenylate cyclase activity of bovine retina. Joó I, et al. **Exp Eye Res** 1980 Dec;31(6):659–63

Autoradiographic study of catecholamine metabolism in amphibian dermis. Hadjioloff AI, et al. **Folia Morphol (Praha)** 1981;29(1):56–8

Effect of catecholamine on the contractile responses of rabbit colon and duodenum to vagus nerve stimulation in vivo. Nakahata N, et al. **Fukushima J Med Sci** 1979;26(3–4):71–7

Effect of chronic sodium depletion on cerebrospinal fluid and plasma catecholamines. Brosnihan KB, et al. **Hypertension** 1981 Mar–Apr; 3(2):233–9

The adrenergic nerve supply to bovine ovarian follicles. Morimoto K, et al. **Int J Fertil** 1981;26(1):14–9

Determination of rat brain tissue catecholamines using liquid chromatography with electrochemical detection. Hegstrand LR, et al. **J Chromatogr** 1981 Jan 2;222(1):107–11

Comparison of the sensitivity of various post-column methods for catecholamine analysis by high-performance liquid chromatography. Yui Y, et al. **J Chromatogr** 1981 Feb 27;206(3):586–8

Regulation of human leukocyte beta receptors by endogenous catecholamines: relationship of leukocyte beta receptor density to the cardiac sensitivity to isoproterenol. Fraser J, et al. **J Clin Invest** 1981 Jun;67(6):1777–84

Selectivity of dobutamine for adrenergic receptor subtypes: in vitro analysis by radioligand binding. Williams RS, et al. **J Clin Invest** 1981 Jun;67(6):1703–11

Immunocytochemical localization of catecholamine synthesizing enzymes and neuropeptides in area postrema and medial nucleus tractus solitarius of rat brain. Armstrong DM, et al. **J Comp Neurol** 1981 Mar 1; 196(3):505–17

A brainstem atlas of catecholaminergic neurons in man, using melanin as a natural marker. Bogerts B. **J Comp Neurol** 1981 Mar 20; 197(1):63–80

Evidence for a catecholaminergic projection to area X in the zebra finch. Lewis JW, et al. **J Comp Neurol** 1981 Feb 20;196(2):347–54

An immunohistochemical study of the organization of catecholaminergic cells and terminal fields in the paraventricular and supraoptic nuclei of the hypothalamus. Swanson LW, et al. **J Comp Neurol** 1981 Feb 20;196(2):271–85

Age-related changes in the catecholamine content of peripheral organs in male and female F344 rats. Martinez JL Jr, et al. **J Gerontol** 1981 May;36(3):280–4

Effect of various stimulus parameters on electrically-induced catecholamine secretion by thin slices of bovine adrenal medulla. Brooks JC, et al. **J Neural Transm** 1981;50(2–4):201–7

Application of high performance liquid chromatography with electrochemical detection to neurochemical analysis: measurement of catecholamines, serotonin and metabolites in rat brain. Mefford IN. **J Neurosci Methods** 1981 Feb;3(3):207–24 (47 ref.)

Specific enhancement of neuronal responses to catecholamine by p-tyramine. Jones RS. **J Neurosci Res** 1981;6(1):49–61

Comparison of the receptors mediating the catecholamine hyperpolarization and slow inhibitory postsynaptic potential in sympathetic ganglia. Cole AE, et al. **J Pharmacol Exp Ther** 1981 May; 217(2):440–4

Potassium-induced release of [3H]catecholamine from brain: effects of pre-exposure to catecholamine uptake inhibitors. Dembiec D, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):727–32

The actions of xylamine on central noradrenergic neurons. Dudley MW, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):834–40

Inhibitory effect of some monoamine oxidase inhibitors on fluorescence assay for the o-methylated metabolites of the catecholamines. Calverley DG, et al. **J Pharmacol Methods** 1981 Mar;5(2):179–81

Effects of chronic treatments upon the brown adipose tissue of rats. II. Comparison between the effects of catecholamine injections and cold adaptation. Mory G, et al. **J Physiol (Paris)** 1980;76(8):859–64

Effects of perhexiline on myocardial phosphorylase activity, myocardial catecholamine content and heart rate. Okabe E, et al. **Jpn Circ J** 1981 Jun;45(6):667–71

Reduced catecholamine excretion at onset of brain death [letter] Feibel JH. **Lancet** 1981 Apr 18;1(8225):890–1

Manganese as agonist and antagonist of calcium ions: dual effect upon catecholamine release from adrenal medulla. Arqueros L, et al. **Life Sci** 1981 Mar 30;28(13):1535–40

DPI, a supposed selective agonist of inhibitory dopamine receptors, strongly increases rat diuresis through alpha-adrenergic receptor activation. Baggio G, et al. **Life Sci** 1981 Mar 30;28(13):1449–56

Fluorescence histochemistry indicates damage of striatal dopamine nerve terminals in rats after multiple doses of methamphetamine. Lorez H. **Life Sci** 1981 Feb 23;28(8):911–6

Dorsal tegmental bundle destruction: effects on operant behavior, brain catecholamine levels, and behavioral suppression produced by adrenergic agonists. Morris MD, et al. **Life Sci** 1980 Dec 22–29; 27(25–26):2621–6

II. Beta-adrenergic receptors and catecholamine sensitive adenylate cyclase in the developing rat lung. Whitsett JA, et al. **Life Sci** 1981 Jan 26;28(4):339–45

Response of white adipocyte of mouse and rabbit to catecholamines and ACTH. 2. Stability and restoration of activity of hormone-sensitive adenylate cyclase of adipocyte plasma membrane. Fan CC, et al. **Mol Cell Biochem** 1981 Jan 20;34(1):43–50

Response of white adipocyte of mouse and rabbit to catecholamines and ACTH. 3. Modified binding properties of beta-adrenoreceptor and its decreased coupling efficiency for adenylate cyclase. Fan CC, et al. **Mol Cell Biochem** 1981 Jan 20;34(1):51–8

Response of white adipocyte of mouse and rabbit to catecholamines and ACTH. 1. Correlation of cyclic AMP levels and initial rates of lipolysis. Fan CC, et al. **Mol Cell Biochem** 1981 Jan 20;34(1):35–41

A pharmacological method to estimate the pKi of competitive inhibitors of agonist uptake processes in isolated tissues. Kenakin TP. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):89–95

Neurohistological and histochemical data on an additional fiber of some encapsulated receptors. Chelyshev YuA. **Neurosci Behav Physiol** 1980 Nov–Dec;10(6):525–9

Presence of avian pancreatic polypeptide-like immunoreactivity in catecholamine and methionine-enkephalin-containing neurones within the central nervous system. Hunt SP, et al. **Neurosci Lett** 1981 Jan 20; 21(2):125–30

Medial prefrontal cortical projections to the region of the dorsal periventricular catecholamine system. Dalsass M, et al. **Neuroscience** 1981;6(4):657–65

Effects of hypoxia lasting up to one month on the catecholamine content in rat carotid body. Hanbauer I, et al. **Neuroscience** 1981;6(1):81–6

Response of adrenal catecholamine to a newly synthesized chemical radioprotector. Hasan SS, et al. **Nuklearmedizin** 1981 Apr;20(2):82–4

Morphological and histochemical correlation of recovery after spinal transection in rat. Sahgal V, et al. **Paraplegia** 1981;19(1):1–6

Lung catecholamines and cyclic nucleotides during perinatal development in the rat. Possible relationships with biochemical and morphological differentiation. Tordet C, et al. **Pediatr Res** 1981 May;15(5):787–93

Simultaneous monoamine histofluorescence and neuropeptide immunocytochemistry: III. Ontogeny of catecholamine varicosities and neurophysin neurons in the rat supraoptic and paraventricular nuclei. Khachaturian H, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):77–95

Simultaneous monoamine histofluorescence and neuropeptide immunocytochemistry: I. Localization of catecholamines and gonadotropin-releasing hormone in the rat median eminence. McNeill TH, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):59–68

Reversal of guanethidine- and diethyldithiocarbamate-induced amnesia by peripherally-administered catecholamines. Walsh TJ, et al. **Pharmacol Biochem Behav** 1981 May;14(5):713–8

Plasma catecholamines and renin during operant blood pressure conditioning in baboons. Goldstein DS, et al. **Physiol Behav** 1981 Jan; 26(1):33–7

Plasma catecholamines in rats: daily variations in basal levels and increments in response to stress. McCarty R, et al. **Physiol Behav** 1981 Jan;26(1):27–31

Adrenal hormones and brain catecholamines responses to morning and afternoon immobilization stress in rats. Torrellas A, et al. **Physiol Behav** 1981 Jan;26(1):129–33

Effects of T-2 toxin on brain catecholamines and selected blood components in growing chickens. Chi MS, et al. **Poult Sci** 1981 Jan; 60(1):137–41

Catecholamine-mediated diuresis in turkeys. Palmore WP, et al. **Proc Soc Exp Biol Med** 1981 May;167(1):1–5

Catecholamines, acetylcholine and excitability of mechanoreceptors. Akoev GN. **Prog Neurobiol** 1980;15(4):269–94

Pharmacological evidence for catecholamine involvement in animal aggression [proceedings] Miczek KA. **Psychopharmacol Bull** 1981 Jan; 17(1):60–2

Pharmacologic manipulations of brain catecholamines and the behavior of Callithrix jacchus (marmoset). Campos F, et al. **Psychopharmacology (Berlin)** 1981;73(3):252–6

Effects of neonatal 6-hydroxydopamine treatment on catecholamine levels and behavior during development and adulthood. Fobes JL, et al. **Psychopharmacology (Berlin)** 1981;73(1):27–30

Use of 6-hydroxydopamine to deplete brain catecholamines in the rhesus monkey: effects on urinary catecholamine metabolites and behavior. Kraemer GW, et al. **Psychopharmacology (Berlin)** 1981;73(1):1–11

Catecholamine-serotonin interaction effects on activity in rats neonatally treated with 6-hydroxydopamine. Olds ME, et al.

Psychopharmacology (Berlin) 1981;73(1):31-3

[Peroperative plasma catecholamine levels during cardiovascular surgery] Caillard B, et al. **Ann Anesthesiol Fr** 1981;22(1):27-31 (Eng. Abstr.) (Fre)

[Determination of psychological stress in sea pilot based on urinary catecholamine excretion] Geister R, et al. **Zentralbl Arbeitsmed Arbeitsschutz Prophyl Ergonomie** 1980 Dec; 30(12):458-63 (Ger)

[Evaluation of catecholamine measurement of high performance liquid chromatography with electronic detector (author's transl)] Kajiwara N, et al. **Horumon To Rinsho** 1980 Oct;28(10):1205-10 (Jpn)

[Retrospect on catecholamine research in our laboratories (author's transl)] Hashimoto K. **Kokyu To Junkan** 1980 Oct;28(10):1096-101 (Jpn)

[Plasma catecholamine concentration as an index for evaluating cardiac sympathetic nerve activity (author's transl)] Miura Y, et al. **Kokyu To Junkan** 1980 Oct;28(10):1111-7 (Jpn)

[Recent advances in high-performance liquid chromatographic method for the determination of picogram amounts of catecholamines and its clinical application (author's transl)] Yui Y, et al. **Kokyu To Junkan** 1980 Oct;28(10):1125-7 (Jpn)

[Effect of endotoxin shock on endocrine function and carbohydrate metabolism (author's transl)] Matsui M. **Masui** 1981 Jan;30(1):39-46 (Eng. Abstr.) (Jpn)

[Measurement of deep body temperature difference after open heart surgery: correlations with hemodynamics, endogenous catecholamine and renin activity (author's transl)] Kawamura T, et al. **Nippon Kyobu Geka Gakkai Zasshi** 1981 Feb;29(2):211-7 (Eng. Abstr.) (Jpn)

[Catecholamines in the brain structures of rats responding differently to the 'open field' test] Belova TI, et al. **Biull Eksp Biol Med** 1981 Feb; 91(2):136-8 (Eng. Abstr.) (Rus)

CENTRAL NERVOUS SYSTEM AGENTS

Identification and quantitation of neutral and basic drugs in blood by gas chromatography and mass spectrometry. Cailleux A, et al. **J Chromatogr Sci** 1981 Apr;19(4):163-76

A clinician's guide to the use of stimulant medication for the psychiatric disorders of children. Cantwell DP. **JDPB** 1980 Sep;1(3):133-40 (58 ref.)

Drug effects on attack defense and escape in mice. Kršiak M, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:47-52

Pharmaco-ethological analysis of social behaviour of isolated mice. Poshivalov VP. **Pharmacol Biochem Behav** 1981;14 Suppl 1:53-9

CHLORDIAZEPOXIDE

Chlordiazepoxide selectively potentiates GABA conductance of spinal cord and sensory neurons in cell culture. Choi DW, et al. **J Neurophysiol** 1981 Apr;45(4):621-31

The interaction of chlordiazepoxide and sodium valproate in the nucleus accumbens of the rat. Kuruvilla A, et al. **Life Sci** 1981 Jan 26; 28(4):393-9

In defense of 'Limbitrol' [letter] Dudley RD Jr. **Minn Med** 1980 Oct; 63(10):713

Effects of morphine and chlordiazepoxide on locomotor activity in two inbred strains of mice. Cuomo V, et al. **Pharmacol Res Commun** 1981 Jan;13(1):87-93

Responders and nonresponders to chlordiazepoxide and placebo: a discriminant function analysis. Downing RW, et al. **Prog Neuropsychopharmacol** 1980;4(4-5):405-15

Food preference following acute or chronic chlordiazepoxide administration: tolerance to an antineophobic action. Cooper SJ, et al. **Psychopharmacology (Berlin)** 1981;73(1):70-4

The partial reinforcement extinction effect after treatment with chlordiazepoxide. Feldon J, et al. **Psychopharmacology (Berlin)** 1981; 73(3):269-75

Benzodiazepine inhibition of the calcium-calmodulin protein kinase system in brain membrane. DeLorenzo RJ, et al. **Science** 1981 Jul 31; 213(4507):546-9

P-CHLOROPHENYLALANINE

Effect of p-chlorophenylalanine and tryptophan on sleep, EEG and motor activity in the rat. Borbély AA, et al. **Behav Brain Res** 1981 Jan; 2(1):1-22

A comparison of an improved o-phthalaldehyde fluorometric method and high pressure liquid chromatography in the determination of brain 5-hydroxyindoles of rats treated with L-tryptophan and p-chlorophenyl-alanine. Curzon G, et al. **Br J Pharmacol** 1981 Jun; 73(2):555-61

The effect of para-chlorophenylalanine of thermoregulation in the Mongolian gerbil (Meriones unguiculatus). McRae MA, et al. **Comp Biochem Physiol [C]** 1981;68C(2):181-6

Effects of para-chlorophenylalanine, a brain serotonin depletor, on pituitary cyclic AMP levels in the rainbow trout, Salmo gairdneri. Olcese J, et al. **Gen Comp Endocrinol** 1981 Apr;43(4):462-6

The effect of para-chlorophenylalanine and scopolamine on passive avoidance in chicks. Mattingly BA, et al. **Pharmacol Biochem Behav** 1981 May;14(5):669-76

CHLORPROMAZINE

Reversed effect of chlorpromazine on hypothalamic serotonin levels of rats with complete deafferentation of the medial basal hypothalamus. Bánky Z, et al. **Acta Biol Acad Sci Hung** 1980;31(1-3):25-32

Influence of phenobarbital, chlorpromazine, progesterone and phenylbutazone on the biliary cholesterol excretion in rats. Barth A, et al. **Acta Biol Med Ger** 1980;39(11-12):1217-26

DL-propranolol and chlorpromazine following admission for schizophrenia. A controlled comparison. Yorkston NJ, et al. **Acta Psychiatr Scand** 1981 Jan;63(1):13-27

The solubility of amphipathic molecules in biological membranes and lipid bilayers and its implications for membrane structure. Conrad MJ, et al. **Biochemistry** 1981 Feb 17;20(4):808-18

Analysis of chlorpromazine in plasma: effect of specimen storage. Gupta RN, et al. **Clin Chim Acta** 1981 Feb 5;109(3):351-4

Prognosis in schizophrenia: individual differences in psychological response to a test dose of antipsychotic drug and their relationship to blood and saliva levels and treatment outcome. May PR, et al. **Compr Psychiatry** 1981 Mar-Apr;22(2):147-52

Blockade of hepatic alpha-adrenergic receptors and responses by chlorpromazine and trifluoperazine. Blackmore PF, et al. **FEBS Lett** 1981 Jan 26;123(2):245-8

Inhibition of phenylephrine-stimulated gluconeogenesis by chlorpromazine is mediated by alpha-adrenergic receptors. Tilley L, et al. **FEBS Lett** 1981 Apr 20;126(2):313-7

Pharmacological studies on 1-(p-aminophenoxy)-3-[N1-(O-methoxyphenyl)-N4-piperazinyl] propane dihydrochloride (74-637). Sur RN, et al. **Indian J Exp Biol** 1980 Oct;18(10):1190-1

Simultaneous determination of diphenhydramine, methaqualone, diazepam and chlorpromazine in liver by use of enzyme digestion: a comparison of digestion procedures. Holzbecher M, et al. **J Anal Toxicol** 1981 Mar-Apr;5(2):62-4

Reversed-phase liquid chromatography for the separation of chloropromazine, imipramine and some of their metabolites. Fekete J, et al. **J Chromatogr** 1981 Jan 16;204:319-27

The separation and determination of chlorpromazine and some of its related compounds by reversed-phase high performance liquid chromatography. Smith DJ. **J Chromatogr Sci** 1981 Feb;19(2):65-71

Inhibition of riboflavin metabolism in rat tissues by chlorpromazine, imipramine, and amitriptyline. Pinto J, et al. **J Clin Invest** 1981 May; 67(5):1500-6

Drug interaction: meperidine and chlorpromazine, a toxic combination. Stambaugh JE Jr, et al. **J Clin Pharmacol** 1981 Apr;21(4):140-6

Effect of chlorpromazine administration on enzyme activity concerning phosphatidic acid metabolism in rat liver. Ide H, et al. **J Pharmacobiodyn** 1980 Nov;3(11):612-9

Differential binding of chlorpromazine to human blood cells: application of the hygroscopic desorption method. Bondy B, et al. **Life Sci** 1981 Jan 26;28(4):441-9

Chlorpromazine-induced decrease of red cell aggregability. Costa D, et al. **Med Interne** 1981 Jan-Mar;19(1):83-7

A comparative study of the interaction of chlorpromazine, trifluoperazine, and promethazine with mouse brain tubulin. Rao AG, et al. **Mol Pharmacol** 1981 Mar;19(2):295-301

Interaction of MIF-I or alpha-MSH with D-amphetamine or chlorpromazine on thermoregulation and motor activity of rats maintained at different ambient temperatures. Yehuda S, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):243-8

Effects of chlorpromazine on escape and avoidance responses: a closer look. Spirduso WW, et al. **Pharmacol Biochem Behav** 1981 Apr; 14(4):433-8

Plasma levels of chlorpromazine and clinical response [proceedings] van Putten T, et al. **Psychopharmacol Bull** 1981 Jan;17(1):113-5

Effects of chlorpromazine on food-maintained and observing behavior. Dearing ME, et al. **Psychopharmacology (Berlin)** 1981;73(3):281-5

The effect of long-term concurrent administration of chlorpromazine and lithium on the striatal and frontal cortical dopamine metabolism in rats. Eroğlu L, et al. **Psychopharmacology (Berlin)** 1981;73(1):84-6

Neuroendocrine tests during treatment with neuroleptic drugs: I. Plasma prolactin response to chlorpromazine challenge. Kolakowska T, et al. **Psychopharmacology (Berlin)** 1981;72(3):283-5

Bilateral skin conductance and the pupillary light-dark reflex: manipulation by chlorpromazine, haloperidol, scopolamine, and placebo. Patterson T, et al. **Psychopharmacology (Berlin)** 1981;73(1):63-9

Concentrations of chlorpromazine and two of its active metabolites in plasma and cerebrospinal fluid of psychotic patients treated with fixed drug doses. Wode-Helgodt B, et al. **Psychopharmacology (Berlin)** 1981; 73(1):55-62

[The dynamics of the drug release from suppositories. Part 5: Liberation of chlorpromazine from suppository bases (author's transl)] Pasich J, et al. **Pharmazie** 1981;36(1):20 (Eng. Abstr.) (Ger)

[Association of chlorpromazine and essential oils of absinthium and mace on operant conditioning behavior of the rat] Fundarò A, et al. **Boll Soc Ital Biol Sper** 1980 Nov 30;56(22):2370–4 (Eng. Abstr.)(Ita)

[Effect of aminazine and majeptil on proliferation of peripheral blood lymphocytes cultivated with phytohemagglutinin] Mitkevich SP, et al. **Zh Nevropatol Psikhiatr** 1981;81(2):115–7 (Eng. Abstr.) (Rus)

CHOICE BEHAVIOR

Selective effects of barbiturate and amphetamine on information processing and response execution. Frowein HW. **Acta Psychol (Amst)** 1981 Feb;47(2):105–15

CLOMIPRAMINE

A sensitive and specific method for the determination of chlorimipramine and desmethylchlorimipramine in plasma using selected ion monitoring with chemical ionization. Lapin A, et al. **Biomed Mass Spectrom** 1980 Nov;7(11–12):588–91

Double-blind trial of amineptine and clomipramine in the treatment of depression. Lemoine P, et al. **Curr Med Res Opin** 1981;7(4):234–40

Differential effects of clomipramine and clorgyline on the sensitivity of cortical neurons to serotonin: effect of chronic treatment. Olpe HR. **Eur J Pharmacol** 1981 Jan 29;69(3):375–7

Determination of clomipramine or imipramine and their mono-demethylated metabolites in human blood or plasma by high-performance liquid chromatography. Godbillon J, et al. **J Chromatogr** 1981 Jan 16;204:303–11

Psychotropic drugs and behaviour therapy. Stern R. **Practitioner** 1981 Jan;225(1351):21–5

Pharmacokinetics of clomipramine in depressive patients. de Cuyper HJ, et al. **Psychiatry Res** 1981 Apr;4(2):147–56

COCAINE

Hepatic periportal necrosis induced by chronic administration of cocaine. Freeman RW, et al. **Biochem Pharmacol** 1981 Apr 1;30(7):777–83

Reward and detection thresholds for brain stimulation: dissociative effects of cocaine. Kornetsky C, et al. **Brain Res** 1981 Mar 30; 209(2):496–500

Prolonged effects of cocaine on hippocampal activity. Lesse H. **Commun Psychopharmacol** 1980;4(3):247–54

Interactions of cocaine and delta 9-tetrahydrocannabinol with the hypothalamic-hypophysial axis of the female rat. Steger RW, et al. **Fertil Steril** 1981 May;35(5):567–72

EENT cocaine shortage leaves mystery in its wake. **Hosp Pract** 1981 Jun;16(6):164–5

Potential errors in benzoylecgonine and cocaine analysis. Fletcher SM, et al. **J Chromatogr** 1981 Feb 6;206(1):193–5

Coca and cocaine 1981. **J Ethnopharmacol** 1981 Mar–May; 3(2–3):110–379

Cocaine pharmacokinetics in humans. Barnett G, et al. **J Ethnopharmacol** 1981 Mar–May;3(2–3):353–66

Coca and cocaine as medicines: an historical review. Grinspoon L, et al. **J Ethnopharmacol** 1981 Mar–May;3(2–3):149–59

Sundry episodes in the history of coca and cocaine. Holmstedt B, et al. **J Ethnopharmacol** 1981 Mar–May;3(2–3):113–47

Guide to the analysis of cocaine and its metabolites in biological material. Lindgren JE. **J Ethnopharmacol** 1981 Mar–May;3(2–3):337–51 (81 ref.)

Constituents of Erythroxylon coca. II. Gas-chromatographic analysis of cocaine and other alkaloids in coca leaves. Turner CE, et al. **J Ethnopharmacol** 1981 Mar–May;3(2–3):293–8

Acute cocaine intoxication in the conscious dog: studies on the mechanism of lethality. Catravas JD, et al. **J Pharmacol Exp Ther** 1981 May; 217(2):350–6

Fixed-ratio responding under second-order schedules of food presentation or cocaine injection. Goldberg SR, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):271–81

Drug-environment interaction: context dependency of cocaine-induced behavioral sensitization. Post RM, et al. **Life Sci** 1981 Feb 16; 28(7):755–60

Acute tolerance to cocaine in humans. Fischman MW, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(34):241–2

The effects cocaine free extracts of the coca leaf on food consumption and locomotor activity. Bedford JA, et al. **Pharmacol Biochem Behav** 1981 May;14(5):725–8

The effects of electric shock on responding maintained by cocaine in rhesus monkeys. Bergman J, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):423–6

Pharmacological evidence for catecholamine involvement in animal aggression [proceedings] Miczek KA. **Psychopharmacol Bull** 1981 Jan; 17(1):60–2

COGNITION

Evaluation of the relative effectiveness of methylphenidate and cognitive behavior modification in the treatment of kindergarten-aged hyperactive children. Cohen NJ, et al. **J Abnorm Child Psychol** 1981 Mar;9(1):43–54

Effects of lithium carbonate and haloperidol on cognition in aggressive, hospitalized school age children [proceedings] Platt JE, et al. **Psychopharmacol Bull** 1981 Jan;17(1):123–5

COGNITION DISORDERS

[Psychomotor disturbance after an endocular operation (author's transl)] Legrand J, et al. **J Fr Ophtalmol** 1981;4(2):143–6 (Eng. Abstr.) (Fre)

CONDITIONING (PSYCHOLOGY)

Effects of diazepam on schedule-controlled and schedule-induced behavior under signaled and unsignaled shock. Hymowitz N. **J Exp Anal Behav** 1981 Jul;36(1):119–32

ACTH4—10 affects behavior but not plasma corticosterone levels in a conditioned taste aversion situation. Smotherman WP, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):207–10

Response artifact in the measurement of neuroleptic-induced anhedonia. Ettenberg A, et al. **Science** 1981 Jul 17;209(4505):357–9

CONDITIONING, CLASSICAL

Hippocampal lesion effects on conditioned taste aversion and pituitary-adrenal activity in rats. Smotherman WP, et al. **Behav Brain Res** 1981 Jan;2(1):33–48

Conditioned social aversion in the male Mongolian gerbil (Meriones unguiculatus). Pettijohn TF. **J Comp Physiol Psychol** 1981 Apr; 95(2):228–39

Aversion to the reinforcer differentially affects conditioned reinforcement and instrumental responding. Wilson CL, et al. **J Exp Psychol [Anim Behav]** 1981 Apr;7(2):165–74

Disruption of autoshaped responding to a single of brain-stimulation reward by neuroleptic drugs. Phillips AG, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):543–8

CONDITIONING, OPERANT

Alterations in brain norepinephrine metabolism and behavior induced by environmental stimuli previously paired with inescapable shock. Cassens G, et al. **Behav Brain Res** 1981 May;2(3):387–407

Regional changes in brain catecholamine turnover in the rat during performance on fixed ratio and variable interval schedules of reinforcement. Heffner TG, et al. **Brain Res** 1981 Jun 9; 214(1):215–8

Time course of chronic haloperidol and clozapine upon operant rate and duration. Faustman W, et al. **Eur J Pharmacol** 1981 Mar 5; 70(1):65–70

Aversion to the reinforcer differentially affects conditioned reinforcement and instrumental responding. Wilson CL, et al. **J Exp Psychol [Anim Behav]** 1981 Apr;7(2):165–74

Effect gamma-melanotropin (gamma-MSH) on the conditioned behavior. Oka M, et al. **J Pharmacobiodyn** 1980 Nov;3(11):628–30

Fixed-ratio responding under second-order schedules of food presentation or cocaine injection. Goldberg SR, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):271–81

Effects of combinations of phencyclidine and pentobarbital on fixed-interval performance in rhesus monkeys. Woolverton WL, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):611–8

Dorsal tegmental bundle destruction: effects on operant behavior, brain catecholamine levels, and behavioral suppression produced by adrenergic agonists. Morris MD, et al. **Life Sci** 1980 Dec 22–29; 27(25–26):2621–6

The effects of electric shock on responding maintained by cocaine in rhesus monkeys. Bergman J, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):423–6

Central 5-hydroxytryptamine and the effects of hallucinogens and phenobarbital on operant responding in rats. Commissaris RL, et al. **Pharmacol Biochem Behav** 1981 May;14(5):595–601

Plasma catecholamines and renin during operant blood pressure conditioning in baboons. Goldstein DS, et al. **Physiol Behav** 1981 Jan; 26(1):33–7

Effects of chlorpromazine on food-maintained and observing behavior. Dearing ME, et al. **Psychopharmacology (Berlin)** 1981;73(3):281–5

[Action of essential oils of chamomile, cinnamon, absinthium, mace and origanum on operant conditioning behavior of the rat] Fundarò A, et al. **Boll Soc Ital Biol Sper** 1980 Nov 30;56(22):2375–80 (Eng. Abstr.) (Ita)

[Association of chlorpromazine and essential oils of absinthium and mace on operant conditioning behavior of the rat] Fundarò A, et al. **Boll Soc Ital Biol Sper** 1980 Nov 30;56(22):2370–4 (Eng. Abstr.)(Ita)

CONFLICT (PSYCHOLOGY)

Effect of sodium dipropylacetate on conflict behavior in rats. Ohmori K, et al. **Jpn J Pharmacol** 1980 Dec;30(6):925–7

Multiple benzodiazepine receptors: evidence of dissociation between anticonflict and anticonvulsant properties by PK 8165 and PK 9084 (two quinoline derivatives). Le Fur G, et al. **Life Sci** 1981 Mar 30; 28(13):1439–48

Impact of social conflict between mice on testosterone binding in the central nervous system. Raab A, et al. **Neuroendocrinology** 1981 May; 32(5):272–7

CORTICOSTERONE

Effects of 22S–hydroxy–cholesterol and other hydroxylated sterols on the ACTH–stimulated steroid production in rat adrenal cells. Huijmans JG, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):243–50

The effect of acute neurogenic stress on corticosterone and Cu an Zn levels in rats. Armario A, et al. **Agressologie** 1980;21(5):259–62

Unconjugated cortisol and corticosterone levels in amniotic fluid [letter] Sippell WG. **Am J Obstet Gynecol** 1981 Jun 1;140(3):353–4

Dissociation of adrenal corticosteroid production from ACTH in water–restricted female rats. Doell RG, et al. **Am J Physiol** 1981 Jul; 241(1):R21–4

Circadian corticosterone rhythm and stress response in rats with adrenal autotransplants. Gibson MJ, et al. **Am J Physiol** 1981 Apr; 240(4):E363–6

Mucosal gastrin receptor. VI. Induction by corticosterone in newborn rats. Peitsch W, et al. **Am J Physiol** 1981 Jun;240(6):G442–9

Specific stimulation of steroidogenesis in rat adrenal zona glomerulosa cells by pituitary peptides. Vinson GP, et al. **Biochem Biophys Res Commun** 1981 Mar 16;99(1):65–72

Paradoxical effects of D–Trp6–LHRH in immature female rats correlated with changes in ACTH, prolactin, and corticosterone levels. Nekola MV, et al. **Biol Reprod** 1981 Apr;24(3):505–11

Plasma corticosterone and thyroxine concentrations during chronic ingestion of crude oil in mallard ducks (Anas platyrhynchos). Rattner BA, et al. **Comp Biochem Physiol [C]** 1981;68C(2):103–7

Adrenal sensitivity to adrenocorticotropin varies diurnally. Kaneko M, et al. **Endocrinology** 1981 Jul;109(1):70–5

Tissue culture of fetal rat islets: corticosterone promotes D cell maintenance and function. McEvoy RC, et al. **Endocrinology** 1981 Jun; 108(6):2277–82

Site and mode of action of indomethacin on the hypothalamo–hypophyseal–adrenal axis: a temporal study in intact, hypothalamic–deafferentated, and hypothalamic–lesioned male rats. Weidenfeld J, et al. **Endocrinology** 1981 Jul;109(1):205–9

Circadian rhythm of plasma corticosterone in vagotomized rats. Itoh S, et al. **Experientia** 1981 Apr 15;37(4):380–1

Plasma corticosterone fluctuations during the oestrous cycle of the house mouse. Nichols DJ, et al. **Experientia** 1981 Mar 15;37(3):319–20

Effects of hypophysectomy and corticosterone acetate treatment on hepatic lipid composition in the chick (Gallus domesticus) embryo. Doneen BA. **Gen Comp Endocrinol** 1981 Mar;43(3):284–91

Plasma concentrations and corticosterone relative to photoperiod, oviposition, and ovulation in the domestic hen. Johnson AL, et al. **Gen Comp Endocrinol** 1981 Jan;43(1):10–6

Correlation between plasma thyroxine levels and corticosterone–binding activity in intact, ovariectomized, and ovariectomized estrogen–treated rats. Calvano SE, et al. **Horm Metab Res** 1981 Mar;13(3):171–4

Concentrations of pituitary, gonadal and adrenal hormones in serum of laying and broody white rock hens (Gallus domesticus). Bedrak E, et al. **J Endocrinol** 1981 May;89(2):197–204

Serum concentrations of prolactin, luteinizing hormone, growth hormone, corticosterone, progesterone, testosterone and oestradiol in relation to broodiness in domestic turkeys (Meleagris gallopavo). Harvey S, et al. **J Endocrinol** 1981 May;89(2):187–95

Radioimmunoassay of brian tissue and cell nuclear corticosterone. McEwen BS, et al. **J Neurosci Methods** 1980 Oct;3(1):57–65

Adrenal steroids and extinction behavior: antagonism by progesterone, deoxycorticosterone and dexamethasone of a specific effect of corticosterone. Bohus B, et al. **Life Sci** 1981 Jan 26;28(4):433–40

Differential effects of cannabinoid exposure and stress on plasma prolactin, growth hormone and corticosterone levels in male mice. Dalterio SL, et al. **Life Sci** 1981 Feb 16;28(7):761–6

Thyroid hormones are required for daily rhythms of plasma corticosterone and prolactin concentration. Ottenweller JE, et al. **Life Sci** 1981 Mar 2;28(9):1033–40

Modulation by transcortin–like binding sites of uptake and distribution of glucocorticoids by dispersed pituitary cells. Koch B, et al. **Mol Cell Endocrinol** 1981 May;22(2):169–78

Effects of extracellular potassium and 4–aminopyridine on corticosteroid secretion. Lymangrover JR, et al. **Mol Cell Endocrinol** 1981 Mar; 21(3):199–210

Corticosteroid–binding globulin and corticosterone interaction with progesterone receptors [letter] Raynaud JP, et al. **Nature** 1981 May 14;291(5811):171–2

The site of inhibitory action of a natural (corticosterone) and synthetic steroid (dexamethasone) in the hypothalamic–pituitary–adrenal axis. Sakakura M, et al. **Neuroendocrinology** 1981 Mar;32(3):174–8

Adrenal steroid inhibition of the vasopressin–neurophysin neurosecretory system to the median eminence of the rat. Differential effects of corticosterone and deoxycorticosterone administration after adrenalectomy. Silverman AJ, et al. **Neuroendocrinology** 1981 Mar; 32(3):129–33

ACTH4--10 affects behavior but not plasma corticosterone levels in a conditioned taste aversion situation. Smotherman WP, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):207–10

Long–term effects of early iron deficiency on consummatory behavior in the rat. Weinberg J, et al. **Pharmacol Biochem Behav** 1981 Apr; 14(4):447–53

The pituitary–adrenal response to 'minimized' schedule–induced drinking. Brett LP, et al. **Physiol Behav** 1981 Feb;26(2):153–8

Kinetic aspects of cycloheximide–induced reversal of adrenocorticotropin effects on steroidogenesis and adrenal phospholipids in vivo. Farese RV, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7189–93

Alterations of biochemical parameters by acute and repetitive stress situations in mice. Quirce CM, et al. **Psychoneuroendocrinology** 1981; 6(1):91–7

Effect of androgens on the rate of muscle protein breakdown in rats treated with glucocorticoids. Santidrian S, et al. **Reproduccion** 1980 Oct–Dec;4(4):331–3

Long–term estrogenization in mammals. IV. Body, adrenal, and testes weights; polydipsia; food intake; vasopressin administration; and serum corticosterone levels in estrogenized male Evans rats. Bischoff F, et al. **Res Commun Chem Pathol Pharmacol** 1981 May;32(2):335–54

Corticosterone increases the amount of protein 1, a neuron–specific phosphoprotein, in rat hippocampus. Nestler EJ, et al. **Science** 1981 Jun 5;212(4499):1162–4

The development and application of a direct radioimmunoassay for corticosterone. Al–Dujaili EA, et al. **Steroids** 1981 Feb;37(2):157–76

[Effect of light on corticosterone synthesis in rat adrenals in vitro] Nikitina MM. **Biol Nauki** 1981;(4):58–63 **(Rus)**

[Glucocorticoid receptor content in the cytoplasm of human peripheral leukocytes] Golikov PP. **Probl Gematol Pereliv Krovi** 1981 Feb; 26(2):22–5 (Eng. Abstr.) **(Rus)**

CORTICOTROPIN

Effects of 22S–hydroxy–cholesterol and other hydroxylated sterols on the ACTH–stimulated steroid production in rat adrenal cells. Huijmans JG, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):243–50

Dissociation of adrenal corticosteroid production from ACTH in water–restricted female rats. Doell RG, et al. **Am J Physiol** 1981 Jul; 241(1):R21–4

Corticoliberin activity of rat neurohypophysis is distinct from vasopressin. Kárteszi M, et al. **Am J Physiol** 1981 Jun;240(6):E689–93

Effects of paraventricular lesions on stimulated ACTH release and CRF in stalk–median eminence of the rat. Makara GB, et al. **Am J Physiol** 1981 Apr;240(4):E441–6

Behavioral activity of met–enkephalin and ACTH4–10 and other peptides containing a phenylalanine and methionine residue. Rigter H, et al. **Biochem Biophys Res Commun** 1981 Jan 30;98(2):424–30

Cyclic AMP is not obligatory for adrenal steroidogenesis. Salmon DM, et al. **Biochem Soc Trans** 1981 Feb;9(1):96–7

Paradoxical effects of D–Trp6–LHRH in immature female rats correlated with changes in ACTH, prolactin, and corticosterone levels. Nekola MV, et al. **Biol Reprod** 1981 Apr;24(3):505–11

Effect of stress and ACTH on dopamine metabolism in the nucleus accumbens and frontal cortex. Fadda F, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):454–8

ACTH1–24 blocks opiate – induced analgesia in the rat. Smock T, et al. **Brain Res** 1981 May 11;212(1):202–6

Adrenocortical responses to adrenocorticotrophin in the rat. Normand M, et al. **Can J Physiol Pharmacol** 1980 Nov;58(11):1279–85

Ultrastructural localization of corticotropin, beta–lipotropin, and alpha- and beta–endorphin in the porcine anterior pituitary. Dacheux F. **Cell Tissue Res** 1981;215(1):87–101

Cytological localization of alpha–MSH, ACTH and beta–endorphin in the pars intermedia of the cichiid teleost Sarotherodon mossambicus. van Eys GJ, et al. **Cell Tissue Res** 1981;215(3):625–33

Presence of beta–endorphin–like immunoreactivity in the anterior pituitary gland of rat and man and evidence for the differential localization with ACTH. Watkins WB, et al. **Cell Tissue Res** 1981; 215(3):577–89

Structure and biosynthesis of pro–adrenocorticotropin/endorphin and related peptides. Eipper BA, et al. **Endocr Rev** 1980 Winter; 1(1):1–27 (186 ref.)

Adrenal sensitivity to adrenocorticotropin varies diurnally. Kaneko M, et al. **Endocrinology** 1981 Jul;109(1):70–5

Regulation of adrenal and testicular prolactin receptors by adrenocorticotropin and luteinizing hormone. Katikineni M, et al. **Endocrinology** 1981 Jun;108(6):2367–74

Evidence for two different turnover pools of adrenocorticotropin, alpha–melanocyte–stimulating hormone, and endorphin–related peptides released by the frog pituitary neurointermediate lobe. Loh YP, et al. **Endocrinology** 1981 Jul;109(1):54–61

Brain serotonin turnover correlates inversely with plasma adrenocorticotropin during the triphasic response to adrenalectomy in

SUBJECT SECTION

rats. Van Loon GR, et al. **Endocrinology** 1981 Jun;108(6):2269–76

Site and mode of action of indomethacin on the hypothalamo–hypophyseal–adrenal axis: a temporal study in intact, hypothalamic–deafferentated, and hypothalamic–lesioned male rats. Weidenfeld J, et al. **Endocrinology** 1981 Jul;109(1):205–9

Demonstration of peptides immunologically related to vertebrate neurohormones in Dugesia lugubris (Turbellaria, Tricladida). Schilt J, et al. **Gen Comp Endocrinol** 1981 Mar;43(3):331–5

Isolation, structure and synthesis of a heptapeptide with in vitro ACTH–releasing activity from porcine hypothalamus. Chang RC, et al. **Horm Metab Res** 1981 Apr;13(4):228–32

Differentiation of MSH–, ACTH–, endorphin–, and LPH–containing cells in the hypophysis during embryonic and fetal development. Dupouy JP. **Int Rev Cytol** 1980;68:197–249 (277 ref.)

The phosphorylation of adrenal proteins in response to adrenocorticotropic hormone. Koroscil TM, et al. **J Biol Chem** 1981 Jul 10;256(13):6700–7

Effect of exogenous and endogenous ACTH on adrenocortical cyclic GMP in the rat. Guillemant J, et al. **J Steroid Biochem** 1981 Jun; 14(6):557–61

Corticotropin/beta–endorphin immunoreactivity in rat mast cells. Peptide or protease? DiAugustine RP, et al. **Life Sci** 1980 Dec 22–29; 27(25–26):2663–8

Chemistry and biosynthesis of pro–opiomelanocortin. ACTH, MSH's, endorphins and their related peptides. Chrétien M, et al. **Mol Cell Biochem** 1981 Jan 28;34(2):101–27 (232 ref.)

Response of white adipocyte of mouse and rabbit to catecholamines and ACTH. 1. Correlation of cyclic AMP levels and initial rates of lipolysis. Fan CC, et al. **Mol Cell Biochem** 1981 Jan 20;34(1):35–41

Response of white adipocyte of mouse and rabbit to catecholamines and ACTH. 2. Stability and restoration of activity of hormone–sensitive adenylate cyclase of adipocyte plasma membrane. Fan CC, et al. **Mol Cell Biochem** 1981 Jan 20;34(1):43–50

Circulating human pituitary pro–gamma–melanotropin enhances the adrenal response to ACTH. Al–Dujaili EA, et al. **Nature** 1981 May 14;291(5811):156–9

Forms and activity of high molecular weight adrenocorticotropin in guinea pig. Gasson JC. **Peptides (Fayetteville)** 1980 Fall;1(3):223–9

ACTH4––10 affects behavior but not plasma corticosterone levels in a conditioned taste aversion situation. Smotherman WP, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):207–10

Kinetic aspects of cycloheximide–induced reversal of adrenocorticotropin effects on steroidogenesis and adrenal phospholipids in vivo. Farese RV, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7189–93

Secretory granules of an anterior pituitary cell line, AtT–20, contain only mature forms of corticotropin and beta–lipotropin. Gumbiner B, et al. **Proc Natl Acad Sci USA** 1981 Jan;78(1):318–22

The regional distribution of gamma 3–melanotropin–like peptides in bovine brain is correlated with adrenocorticotropin immunoreactivity but not with beta–endorphin. Shibasaki T, et al. **Regul Pept** 1981 Apr; 2(1):43–52

Differential immunostaining of adenohypophysial cells with antisera to ACTH and beta–endorphin. Watkins WB. **Regul Pept** 1981 Mar; 1(6):375–85

Changes in the peripheral blood leucocyte populations following an injection of corticotrophin in the immature chicken. Davison TF, et al. **Res Vet Sci** 1981 Jan;30(1):79–82

CORTICOTROPIN RELEASING HORMONE

Corticoliberin activity of rat neurohypophysis is distinct from vasopressin. Kárteszi M, et al. **Am J Physiol** 1981 Jun;240(6):E689–93

Effects of paraventricular lesions on stimulated ACTH release and CRF in stalk–median eminence of the rat. Makara GB, et al. **Am J Physiol** 1981 Apr;240(4):E441–6

Isolation, structure and synthesis of a heptapeptide with in vitro ACTH–releasing activity from porcine hypothalamus. Chang RC, et al. **Horm Metab Res** 1981 Apr;13(4):228–32

CRITICAL PERIOD (PSYCHOLOGY)

Critical periods for diphenylhydantoin and phenobarbital administration during gestation. Gauron EF, et al. **Psychol Rep** 1980 Dec; 47(3 Pt 2):1163–6

DANSYL COMPOUNDS

Selective inhibition of schistosome acetylcholinesterase by dansylated acetylcholine analogs. Dotson MJ, et al. **Comp Biochem Physiol [C]** 1981;68C(2):229–30

[Dansylated amino acid separation by polyacrylamide gel electrophoresis] Svinarchuk FP, et al. **Prikl Biokhim Mikrobiol** 1981 Jan–Feb; 17(1):144–50 (Eng. Abstr.) **(Rus)**

DECISION MAKING

Drug therapy decisions. A social judgment analysis. Gillis JS, et al. **J Nerv Ment Dis** 1981 Jul;169(7):439–47

DEFENSE MECHANISMS

Drug effects on attack defense and escape in mice. Kršiak M, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:47–52

DEMENTIA

Pseudodementia and physical findings masking significant psychopathology. Good MI. **Am J Psychiatry** 1981 Jun;138(6):811–4

DEPRESSION

Recent advances in the treatment of depression. Proceedings of an international symposium, Corfu, Greece, April 16––18, 1980. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):1–477

Zimelidine to geriatric patients: a pharmacokinetic and clinical study. Dehlin O, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):410–24

Anxiety and/or the depressive syndromes. Kline NS. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):271–6

Electroconvulsive therapy and receptor sensitivity. Modigh K, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):91–9

The medically ill elderly, tricyclic response, and ECT [letter] Small G, et al. **Am J Psychiatry** 1981 May;138(5):703–4

Convulsive and drug therapies of depression. Fink M. **Annu Rev Med** 1981;32:405–12 (71 ref.)

Prophylactic effect of lithium against depression in cyclothymic patients: a life–table analysis. Peselow ED, et al. **Compr Psychiatry** 1981 May–Jun;22(3):257–64

Oxazepam in the treatment of anxiety associated with depression: results of treatment in 1600 cases (Studies in depression, VI). Bailey HR, et al. **Curr Med Res Opin** 1981;7(3):156–63

Double–blind trial of amineptine and clomipramine in the treatment of depression. Lemoine P, et al. **Curr Med Res Opin** 1981;7(4):234–40

Classification, biochemistry of depression and the mode of action of antidepressant drugs. Okasha A. **Egypt J Psychiatry** 1979 Apr; 2(1):3–18

Viloxazine and the depressed schizophrenic––methodological issues. Kurland AA, et al. **J Clin Pharmacol** 1981 Jan;21(1):37–41

A double–blind study of dothiepin hydrochloride (Prothiaden) and amitriptyline in out–patients with masked depression. Dahl LE, et al. **J Int Med Res** 1981;9(2):103–7

A comparison of the therapeutic and cardiovascular effects of a single nightly dose of Prothiaden (dothiepin, dosulepin) and Lentizol (sustained–release amitriptyline) in depressed elderly patients. Khan AU. **J Int Med Res** 1981;9(2):108–12

Antidepressant efficacy of tranylcypromine isomers: a controlled study. Moises HW, et al. **J Neural Transm** 1981;50(2–4):185–92

A preliminary evaluation of parenting, depression, and violence profiles in methadone–maintained women. Oehlberg SM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(34):380–6

Evaluation of the clinical efficacy of single daily doses of antidepressants. De Maio D, et al. **Prog Neuropsychopharmacol** 1980;4(6):607–12

Clinical response, plasma levels and pharmacokinetics of desipramine in depressed in–patients. Hrdina PD, et al. **Prog Neuropsychopharmacol** 1980;4(6):591–600

Platelet MAO activity and monoamine metabolites in cerebrospinal fluid in depressed and suicidal patients and in healthy controls. Oreland L, et al. **Psychiatry Res** 1981 Feb;4(1):21–9

The therapeutic profile of mianserin in mild elderly depressives [proceedings] Branconnier RJ, et al. **Psychopharmacol Bull** 1981 Jan; 17(1):129–31

Vasopressin function in depression and mania [proceedings] Gold PW, et al. **Psychopharmacol Bull** 1981 Jan;17(1):7–9

Effects of phenelzine and amitriptyline on depression [proceedings] Paykel ES, et al. **Psychopharmacol Bull** 1981 Jan;17(1):104–6

The pharmacological treatment of schizoaffective disorder–depressed: a review of the literature [proceedings] Spiker DG. **Psychopharmacol Bull** 1981 Jan;17(1):75–8

Methylphenidate in depression and states of apathy. Moore DP. **South Med J** 1981 Mar;74(3):347–8

[Drug therapy of depression: benefits and limits of blood levels of tricyclic antidepressants] Baumann P. **Schweiz Med Wochenschr** 1981 Feb 14; 111(7):228–39 (112 ref.) (Eng. Abstr.) **(Fre)**

[Therapy of elderly depressive patients. Lofepramine and amitriptyline under double–blind conditions] Jessel HJ, et al. **ZFA (Stuttgart)** 1981 Apr 10;57(10):784–8 **(Ger)**

DEPRESSIVE DISORDER

The Hamilton depression scale. Evaluation of objectivity using logistic models. Bech P, et al. **Acta Psychiatr Scand** 1981 Mar;63(3):290–9

The temporo–spatial context. A neglected aspect of the depressive response. León CA. **Acta Psychiatr Scand** 1981 Feb;63(2):129–46

Depression and cerebrospinal fluid citrate. Mellerup ET, et al.

Acta Psychiatr Scand 1981 Jan;63(1):57-60

A double-blind comparison of nomifensine and amitriptyline in the treatment of depression. Ong SB, et al. **Acta Psychiatr Scand** 1981 Mar; 63(3):198-207

Plasma tryptophan binding to albumin in unipolar depressives. Riley GJ, et al. **Acta Psychiatr Scand** 1981 Feb;63(2):165-72

Recent advances in the treatment of depression. Proceedings of an international symposium, Corfu, Greece, April 16--18, 1980. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):1-477

Controlled cross-over study of a 5-HT uptake inhibiting and an NA uptake inhibiting antidepressant. Aberg A. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):244-55

Biogenic amines and depression (introduction to symposium). Agurell S. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):17-9

Zimelidine vs maprotiline in depressed outpatients. A preliminary report. d'Elia G, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):225-35

Influence of depression and antidepressants on weight. Gottfries CG. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):353-6

Depression: treatment compliance in general practice. Johnson DA. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):447-53

Anxiety and/or the depressive syndromes. Kline NS. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):271-6

Zimelidine and amitriptyline in the treatment of depressive illness in general practice. Loudon JB, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):454-63

Growth hormone response in patients with depression. Matussek N, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):122-6

A double blind comparison of zimelidine and amitriptyline in endogenous depression. Montgomery SA, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):314-27

Serotonin and noradrenaline uptake inhibitors in the treatment of depression--relationship to 5-HIAA in spinal fluid. Träskman-Bendz L, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):209-18

5-HT reuptake inhibitors plus tryptophan in endogenous depression. Wålinder J, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):179-90

Zimelidine: comparison of different dosage regimes in general practice. Watson JM, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):464-70

Antidepressant drug therapy. DeGennaro M, et al. **Am J Nurs** 1981 Jul; 81(7):1304-10

Effect of lithium on glycine levels in patients with affective disorders. Deutsch SI, et al. **Am J Psychiatry** 1981 May;138(5):683-4

Psychotic depression: a separate entity? Frances A, et al. **Am J Psychiatry** 1981 Jun;138(6):831-3

Pseudodementia and physical findings masking significant psychopathology. Good MI. **Am J Psychiatry** 1981 Jun;138(6):811-4

Effect of alcohol consumption and cigarette smoking on antidepressant levels of depressed patients. Linnoila M, et al. **Am J Psychiatry** 1981 Jun;138(6):841-2

Plasma tryptophan and five other amino acids in depressed and normal subjects. DeMyer MK, et al. **Arch Gen Psychiatry** 1981 Jun; 38(6):642-6

The effect of psychobiological research on treatment outcome. A controlled study. Kocsis JH, et al. **Arch Gen Psychiatry** 1981 May; 38(5):511-5

Correlation of individual symptoms and other clinical variables with cerebrospinal fluid amine metabolites and tryptophan in depression. Banki CM, et al. **Arch Psychiatr Nervenkr** 1981;229(4):345-53

Receptors, adenylate cyclase, depression, and lithium. Belmaker RH. **Biol Psychiatry** 1981 Apr;16(4):333-50

Cerebral evoked potential changes produced by treatment with lithium carbonate. Straumanis JJ Jr, et al. **Biol Psychiatry** 1981 Feb; 16(2):113-29

Management of depression with serotonin precursors. van Praag HM. **Biol Psychiatry** 1981 Mar;16(3):291-310

Effect of piribedil (ET-495) on plasma norepinephrine: relationship to antidepressant response. Reus VI, et al. **Commun Psychopharmacol** 1980; 4(3):207-13

Depressive illness in general practice: a pilot study. Watson JM, et al. **Health Bull (Edinb)** 1981 Mar;39(2):112-6

Viloxazine in the treatment of depressive neurosis: a placebo and standard (imipramine) controlled clinical study. Petrie WM, et al. **Int Pharmacopsychiatry** 1980;15(3):193-6

Relapse after short-term drug therapy in neurotic outpatients. Rickels K, et al. **Int Pharmacopsychiatry** 1980;15(3):186-92

Single- versus multiple-dose comparative trial of desipramine hydrochloride: a double-placebo method. Barnes RJ, et al. **J Clin Pharmacol** 1980 Nov-Dec;20(11-12):681-8

A critical appraisal of amoxapine. Smith RS Jr, et al. **J Clin Psychiatry** 1981 Jun;42(6):238-42

The clinical characteristics and treatment of atypical depression. Sovner RD. **J Clin Psychiatry** 1981 Jul;42(7):285-9

Maprotiline (Ludiomil)--another antidepressant. **Med Lett Drugs Ther** 1981 Jun 26;23(13):58-9

Relationship between response to phenelzine and MAO inhibition in a clinical trial of phenelzine, amitriptyline and placebo. Raft D, et al. **Neuropsychobiology** 1981;7(3):122-6

Serum DBH and platelet MAO in patients with depressive disorders. Honecker H, et al. **Pharmacopsychiatria** 1981 Jan;14(1 Suppl):10-4

Nortriptyline and pituitary-thyroid function in affective disorder. Nordgren L, et al. **Pharmacopsychiatria** 1981 Mar;14(2):61-5

Clinical pharmacology of viloxazine hydrochloride. Vandel B, et al. **Pharmacopsychiatria** 1981 Mar;14(2):66-70

Noradrenergic transmission in depression: under- or overfunction? Waldmeier PC. **Pharmacopsychiatria** 1981 Jan;14(1 Suppl):3-9

Interrelationship of hysteroid dysphoria and borderline personality disorder. Liebowitz MR, et al. **Psychiatr Clin North Am** 1981 Apr; 4(1):67-87

Pharmacokinetics of clomipramine in depressive patients. de Cuyper HJ, et al. **Psychiatry Res** 1981 Apr;4(2):147-56

An inverse correlation between serum levels of desmethylimipramine and melatonin-like immunoreactivity in DMI-responsive depressives. Halbreich U, et al. **Psychiatry Res** 1981 Feb;4(1):109-13

Pretreatment amine neurotransmitter system interrelationships in depression [proceedings] Bowden CL, et al. **Psychopharmacol Bull** 1981 Jan;17(1):70-2

Clinical trials with new bicyclic and tetracyclic compounds: zimelidine and maprotiline [proceedings] Claghorn JL, et al. **Psychopharmacol Bull** 1981 Jan;17(1):23-6

Clinical efficacy of the new antidepressant bupropion (Wellbutrin) [proceedings] Halaris AE, et al. **Psychopharmacol Bull** 1981 Jan; 17(1):140-2

Factors which affect antidepressant drug responses in a multicenter controlled trial [proceedings] Logue JN, et al. **Psychopharmacol Bull** 1981 Jan;17(1):138-9

Novel antidepressants: a clinical trial of mianserin [proceedings] McGrath PJ, et al. **Psychopharmacol Bull** 1981 Jan;17(1):21-3

Crossover study of zimelidine and desipramine in depression: evidence for amine specificity [proceedings] Potter WZ, et al. **Psychopharmacol Bull** 1981 Jan;17(1):26-9

Lithium and imipramine in the prophylaxis of unipolar and bipolar II depression: a prospective, placebo-controlled comparison [proceedings] Quitkin FM, et al. **Psychopharmacol Bull** 1981 Jan;17(1):142-4

Possible pathophysiological mechanisms in subtypes of unipolar depressive disorders based on differences in urinary MHPG levels [proceedings] Schildkraut JJ, et al. **Psychopharmacol Bull** 1981 Jan;17(1):90-91

Second generation antidepressants: a clinical pharmacotherapeutic research strategy [proceedings] Shopsin B. **Psychopharmacol Bull** 1981 Jan;17(1):33-5

Efficacy of desipramine in mildly depressed patients: a double-blind, placebo-controlled trial [proceedings] Stewart JW, et al. **Psychopharmacol Bull** 1981 Jan;17(1):136-8

Unexpected neuroendocrine-transmitter relationships [proceedings] Stokes PE, et al. **Psychopharmacol Bull** 1981 Jan;17(1):72-5

Is the failure of (-)deprenyl, a selective monoamine oxidase B inhibitor, to alleviate depression related to freedom from the cheese effect? Mendis N, et al. **Psychopharmacology (Berlin)** 1981;73(1):87-90

[Management of treatment-resistant depression without ECT (author's transl)] Kielholz P, et al. **Dtsch Med Wochenschr** 1981 May 22; 106(21):671-3 (Eng. Abstr.) (Ger)

[Studies on stress in psychiatric patients (author's transl)] Ackenheil M, et al. **MMW** 1981 May 8;123(19):805-8 (Eng. Abstr.) (Ger)

[Development of biological psychiatric depression research (author's transl)] Matussek N. **MMW** 1981 May 8;123(19):793-4 (Eng. Abstr.) (Ger)

[Pharmacological treatment of affective disorders (author's transl)] Beckmann H. **Nervenarzt** 1981 Mar;52(3):135-46 (Ger)

[Treatment of depression with psychotropic drugs (author's transl)] Gastpar M. **Praxis** 1981 Feb 3;70(6):215-9 (Eng. Abstr.) (Ger)

[24 hours plasma tryptophan levels in patients with endogenous depression (author's transl)] Malatino LS, et al. **Riv Patol Nerv Ment** 1979 Nov-Dec;100(6):340-6 (Eng. Abstr.) (Ita)

[Plasma dopamine beta-hydroxylase activity in endogenous depressive syndromes] Pużyński S, et al. **Psychiatr Pol** 1980 Nov-Dec; 14(6):581-6 (Eng. Abstr.) (Pol)

DESIPRAMINE

Withdrawal from chronic phencyclidine (PCP) dependence with desipramine. Tennant FS Jr, et al. **Am J Psychiatry** 1981 Jun; 138(6):845-7

Brain distribution and kinetics of desipramine in the rat. Hrdina PD, et al. **Can J Physiol Pharmacol** 1981 Feb;59(2):163-7

Plasma desipramine levels after single dosage and at steady state in outpatients. Rudorfer MV, et al. **Commun Psychopharmacol** 1980; 4(3):185-8

'High affinity' binding of [3H]desipramine to rat cerebral cortex: relationship to tricyclic antidepressant-induced inhibition of norepinephrine uptake. Rehavi M, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):597-9

Single- versus multiple-dose comparative trial of desipramine hydrochloride: a double-placebo method. Barnes RJ, et al. **J Clin Pharmacol** 1980 Nov-Dec;20(11-12):681-8

An enhanced sensitivity of muscarinic cholinergic receptor associated with dopaminergic receptor subsensitivity after chronic antidepressant treatment. Koide T, et al. **Life Sci** 1981 Mar 9;28(10):1139-45

Subsensitivity of the beta-adrenergic receptor-linked adenylate cyclase system of rat pineal gland following repeated treatment with desmethylimipramine and nialamide. Moyer JA, et al. **Mol Pharmacol** 1981 Mar;19(2):187-93

Subchronic treatment with the tricyclic antidepressant DMI increases isolation-induced fighting in rats. Willner P, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):475-9

Clinical response, plasma levels and pharmacokinetics of desipramine in depressed in-patients. Hrdina PD, et al. **Prog Neuropsychopharmacol** 1980;4(6):591-600

An inverse correlation between serum levels of desmethylimipramine and melatonin-like immunoreactivity in DMI-responsive depressives. Halbreich U. et al. **Psychiatry Res** 1981 Feb;4(1):109-13

Differential effect of chronic desipramine and amitriptyline treatment on rat brain adrenergic and serotonergic receptors. Tang SW, et al. **Psychiatry Res** 1981 Apr;4(2):129-38

Crossover study of zimelidine and desipramine in depression: evidence for amine specificity [proceedings] Potter WZ, et al. **Psychopharmacol Bull** 1981 Jan;17(1):26-9

Efficacy of desipramine in mildly depressed patients: a double-blind, placebo-controlled trial [proceedings] Stewart JW, et al. **Psychopharmacol Bull** 1981 Jan;17(1):136-8

Changes in action of tricyclic and tetracyclic antidepressants: desipramine and mianserin, on avoidance behavior in the course of the chronic treatment. Hano J, et al. **Psychopharmacology (Berlin)** 1981; 73(3):265-8

[Changes of neuronal activity in the rat's hippocampus under long-term treatment with desipramine] Jähkel M, et al. **Acta Biol Med Ger** 1980; 39(10):1083-7 (Eng. Abstr.) **(Ger)**

DESOXYCORTICOSTERONE

Metyrapone effect on blood pressure and deoxycorticosterone levels in the rat. Hauger-Klevene JH, et al. **Acta Physiol Lat Am** 1978; 28(4-5):219-21

Mineralocorticoid effects on Na-K-ATPase in individual nephron segments. Garg LC, et al. **Am J Physiol** 1981 Jun;240(6):F536-44

Deoxycorticosterone biosynthesis from progesterone in kidney tissue of the human fetus. Winkel CA, et al. **J Clin Endocrinol Metab** 1981 Jul; 53(1):10-5

Adrenal steroids and extinction behavior: antagonism by progesterone, deoxycorticosterone and dexamethasone of a specific effect of corticosterone. Bohus B, et al. **Life Sci** 1981 Jan 26;28(4):433-40

Adrenal steroid inhibition of the vasopressin-neurophysin neurosecretory system to the median eminence of the rat. Differential effects of corticosterone and deoxycorticosterone administration after adrenalectomy. Silverman AJ, et al. **Neuroendocrinology** 1981 Mar; 32(3):129-33

Plasma concentrations of 11-deoxycorticosterone in women during the menstrual cycle. Parker CR Jr, et al. **Obstet Gynecol** 1981 Jul; 58(1):26-30

Deoxycorticosterone biosynthesis in human kidney: potential for formation of a potent mineralocorticosteroid in its site of action. Winkel CA, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7069-73

5 alpha-Dihydro-11-deoxycorticosterone: effect on blood pressure in the rat. Carroll J, et al. **Steroids** 1981 Jan;37(1):111-20

19-Nor-deoxycorticosterone in the neutral fraction of human urine. Dale SL, et al. **Steroids** 1981 Jan;37(1):103-9

DEXTROAMPHETAMINE

Apparent serotonergic modulation of the dose-dependent biphasic response of neostriatal neurons produced by D-amphetamine. Rebec GV, et al. **Brain Res** 1981 Apr 6;210(1-2):277-89

Effects of intracerebroventricular injection of d-amphetamine on metabolic, respiratory, and vasomotor activities and body temperatures in the rat. Lin MT, et al. **Can J Physiol Pharmacol** 1980 Aug; 58(8):903-8

Cats develop tolerance to d-amphetamine's effects upon locomotior and stereotyped behaviors. Jacobs BL, et al. **Eur J Pharmacol** 1981 Jan 29; 69(3):353-6

A comparison of the hypothermic effects of methylphenidate and d-amphetamine. Yehuda S, et al. **Int J Neurosci** 1981;13(2-3):117-20

Growth hormone, prolactin, and growth responses in hyperkinetic males treated with d-amphetamine. Greenhill LL, et al. **J Am Acad Child Psychiatry** 1981 Winter;20(1):84-103

Effects of in vivo amphetamine administration on dopamine synthesis regulation in rat brain striatal synaptosomes. Patrick RL, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):686-91

Neurotensin blocks certain amphetamine-induced behaviours. Ervin GN, et al. **Nature** 1981 May 7;291(5810):73-6

Interaction of MIF-I or alpha-MSH with D-amphetamine or chlorpromazine on thermoregulation and motor activity of rats maintained at different ambient temperatures. Yehuda S, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):243-8

Effects of amphetamine and phenylpropanolamine on food intake in rats with ventromedial hypothalamic or dorsolateral tegmental damage. Wellman PJ, et al. **Physiol Behav** 1980 Dec;25(6):819-27

Computer analyzed EEG in amphetamine-responsive hyperactive children. McIntyre HB, et al. **Psychiatry Res** 1981 Apr;4(2):189-97

The hyperactive child syndrome: peripheral sympathetic nervous system function and the effect of d-amphetamine. Mikkelsen E, et al. **Psychiatry Res** 1981 Apr;4(2):157-69

Pharmacological evidence for catecholamine involvement in animal aggression [proceedings] Miczek KA. **Psychopharmacol Bull** 1981 Jan; 17(1):60-2

Long-term d-amphetamine in rats: lack of change in post-synaptic dopamine receptor sensitivity. Jackson DM, et al. **Psychopharmacology (Berlin)** 1981;73(3):276-80

The effects of electroconvulsive shock on the discriminative stimulus properties of d-amphetamine and apomorphine: evidence for dopamine receptor alteration subsequent ECS. White DK, et al. **Psychopharmacology (Berlin)** 1981;73(3):211-4

The effects of d-amphetamine and potassium on serotonin release and metabolism in rat cerebral cortex tissue. Homan HD, et al. **Res Commun Chem Pathol Pharmacol** 1981 Feb;31(2):223-40

DIAZEPAM

Antagonism of 4-aminopyridine to ketamine-diazepam anesthesia in children. Martínez-Aguirre E. **Acta Anaesthesiol Belg** 1980; 31(4):289-91

Case report of unusual diazepam abstinence syndrome. Nagy BR, et al. **Am J Psychiatry** 1981 May;138(5):694-5

The effect of diazepam on the cerebral metabolic state in rats and its interaction with nitrous oxide. Carlsson C, et al. **Anesthesiology** 1981 Jun;54(6):488-95

Treatment of diazepam withdrawal syndrome with propranolol. Abernethy DR, et al. **Ann Intern Med** 1981 Mar;94(3):354-5

The role of albumin conformation in the binding of diazepam to human serum albumin. Wilting J, et al. **Biochim Biophys Acta** 1980 Dec 16; 626(2):291-8

The replicability of the psychophysiological effects of diazepam. Itil TM, et al. **Biol Psychiatry** 1981 Jan;16(1):65-70

Concentrations of N-descyclopropylmethylprazepam in whole-blood, plasma, and milk after administration of prazepam to humans. Brodie RR, et al. **Biopharm Drug Dispos** 1981 Jan-Mar;2(1):59-68

Plasma diazepam and desmethyldiazepam concentrations during long-term diazepam therapy. Greenblatt DJ, et al. **Br J Clin Pharmacol** 1981 Jan;11(1):35-40

Sex-related differences in the plasma protein binding of lignocaine and diazepam. Routledge PA, et al. **Br J Clin Pharmacol** 1981 Mar; 11(3):245-50

Benzodiazepines prevent kainate-induced loss of GABAergic and cholinergic neurons in the chick retina. Imperato A, et al. **Brain Res** 1981 May 25;213(1):205-10

The insensitivity of developing benzodiazepine receptors to chronic treatment with diazepam, GABA and muscimol in brain cell cultures. Shibla DB, et al. **Brain Res** 1981 Apr 6;210(1-2):471-4

Effects of desmethyldiazepam on diazepam kinetics: a study of effects of a metabolite on parent drug disposition. Abernethy DR, et al. **Clin Pharmacol Ther** 1981 Jun;29(6):757-61

Diazepam effects and kinetics in Caucasians and Orientals. Ghoneim MM, et al. **Clin Pharmacol Ther** 1981 Jun;29(6):749-56

Diazepam interaction with antituberculosis drugs. Ochs HR, et al. **Clin Pharmacol Ther** 1981 May;29(5):671-8

Clobazam and diazepam in anxiety. Rickels K, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):95-100

Availability of isosorbide dinitrate, diazepam and chlormethiazole, from i.v. delivery systems. Cossum PA, et al. **Eur J Clin Pharmacol** 1981 Feb;19(3):181-5

Increase of benzodiazepine binding to the membranes isolated in the presence of diazepam. Korneyev AY, et al. **Eur J Pharmacol** 1981 Apr 24;71(1):127-30

Phasic hippocampal activity during paradoxical sleep in the rat: selective suppression after diazepam administration. Monmaur P. **Experientia** 1981 Mar 15;37(3):261-2

Excessive premedication of diazepam [letter] Smith BL. **Gastrointest Endosc** 1981 May;27(2):110

Limited usefulness of the breath test in evaluation of drug metabolism: a study in human oral contraceptive users treated with dimethylaminoantipyrine and diazepam. Sonnenberg A, et al. **Hepatogastroenterology** 1980 Apr;27(2):104-8

Simultaneous determination of diphenhydramine, methaqualone, diazepam and chlorpromazine in liver by use of enzyme digestion: a comparison of digestion procedures. Holzbecher M, et al. **J Anal Toxicol** 1981 Mar-Apr;5(2):62-4

Determination of diazepam and its major metabolites in man and in the cat by high-performance liquid chromatography. Cotler S, et al.

J Chromatogr 1981 Jan 2;222(1):95–106

Comparative protein binding of diazepam and desmethyldiazepam. Allen MD, et al. **J Clin Pharmacol** 1980 Nov–Dec;20(11–12):639–43

A comparison of prazepam, diazepam, lorazepam and placebo in anxious outpatients in non-psychiatric private practices. Zung WW, et al. **J Clin Psychiatry** 1981 Jul;42(7):280–4

Effects of diazepam on schedule-controlled and schedule-induced behavior under signaled and unsignaled shock. Hymowitz N. **J Exp Anal Behav** 1981 Jul;36(1):119–32

Comparison of the therapeutic effect, tolerance and safety of ketazolam and diazepam administered for six months to out-patients with chronic anxiety neurosis. Fabre LF, et al. **J Int Med Res** 1981;9(3):191–8

Benzodiazepine withdrawal symptoms and propranolol. Tyrer P, et al. **Lancet** 1981 Mar 7;1(8219):520–2

Benzodiazepine receptor: heterogeneity in rabbit brain. Yokoi I, et al. **Life Sci** 1981 Apr 6;28(14):1591–5

The effect of diazepam on nystagmus induced by stimulation of the lateral geniculate body in the rabbit. Ishikawa M, et al. **Neuropharmacology** 1981 May;20(5):435–9

Effect of diazepam on stress induced changes in brain histamine. Mazurkiewicz-Kwilecki IM. **Pharmacol Biochem Behav** 1981 Mar; 14(3):333–8

An in vitro study of the interaction between diazepam and some antacid or excipients. Naggar VF. **Pharmazie** 1981;36(2):114–7

Psychotropic drugs and behaviour therapy. Stern R. **Practitioner** 1981 Jan;225(1351):21–5

Public judgments on the importance of valium information [proceedings] Fisher S, et al. **Psychopharmacol Bull** 1981 Jan;17(1):134

Memory and performance effects of single and 3-week administration of diazepam. Ghoneim MM, et al. **Psychopharmacology (Berlin)** 1981; 73(2):147–51

The relationships between clinical response, psychophysiological variables and plasma levels of amitriptyline and diazepam in neurotic outpatients. Johnstone EC, et al. **Psychopharmacology (Berlin)** 1981;72(3):233–40

Impairment of learning or memory in the mature and old rat by diazepam. Komiskey HL, et al. **Psychopharmacology (Berlin)** 1981;73(3):304–5

Benzodiazepine inhibition of the calcium-calmodulin protein kinase system in brain membrane. DeLorenzo RJ, et al. **Science** 1981 Jul 31; 213(4507):546–9

[Diazemuls. Diazepam in a new vehicle for parenteral use] Hüttel MS, et al. **Ugeskr Laeger** 1981 Jan;143(3):140 **(Dan)**

[A double blind trial : oxprenolol/diazepam (author's transl)] Scharbach H. **Encephale** 1981;7(1):51–8 (Eng. Abstr.) **(Fre)**

[The influence of oxazepam and diazepam on the sexual behaviour and level of GABA biogenic amines in a male rat's brain (author's transl)] Borzęcki Z, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979; 34:371–6 (Eng. Abstr.) **(Pol)**

[Role of the GABA-ergic link in the development of the tranquilizing effect in cats] Kozlovskaia MM, et al. **Biull Eksp Biol Med** 1981; 91(1):45–8 (Eng. Abstr.) **(Rus)**

DIBENZAZEPINES

The effect of mianserin on urinary catecholamine excretion in psychiatric patients. Moody JP, et al. **Br J Clin Pharmacol** 1981 Jan; 11(1):103–5

Mianserin: direct activation of brain norepinephrine neurons by blocking alpha 2-receptors. Engberg G, et al. **Commun Psychopharmacol** 1980; 4(3):233–9

The metabolism of mianserin in women, rabbits, and rats: identification of the major urinary metabolites. de Jongh GD, et al. **Drug Metab Dispos** 1981 Jan–Feb;9(1):48–53

Supersensitivity of central noradrenergic presynaptic autoreceptors following chronic treatment with the antidepressant mianserin. Cerrito F, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):425–6

Time course of chronic haloperidol and clozapine upon operant rate and duration. Faustman W, et al. **Eur J Pharmacol** 1981 Mar 5; 70(1):65–70

Cardiovascular effects of mianserin and amitriptyline in healthy volunteers. Wester HA, et al. **Int J Clin Pharmacol Ther Toxicol** 1980 Dec;18(12):513–7

Mianserin: a possible cause of neutropenia and agranulocytosis. Adverse Drug Reactions Advisory Committee. **Med J Aust** 1980 Dec 13; 2(12):673–4

Comparison of the antimuscarinic activity of mianserin and amitriptyline in the cat superior cervical ganglion. Kwok YH, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):161–4

The therapeutic profile of mianserin in mild elderly depressives [proceedings] Branconnier RJ, et al. **Psychopharmacol Bull** 1981 Jan; 17(1):129–31

Novel antidepressants: a clinical trial of mianserin [proceedings] McGrath PJ, et al. **Psychopharmacol Bull** 1981 Jan;17(1):21–3

Changes in action of tricyclic and tetracyclic antidepressants: desipramine and mianserin, on avoidance behavior in the course of the chronic treatment. Hano J, et al. **Psychopharmacology (Berlin)** 1981; 73(3):265–8

Clozapine: plasma levels and prolactin response. Kane JM, et al. **Psychopharmacology (Berlin)** 1981;73(2):184–7

[Does clozapine cause dependence?] Zapletálek M, et al. **Agressologie** 1990;21(A):19–21 (Eng. Abstr.) **(Ger)**

[Peculiarities and difficulties in the systematic drug therapy of chronic schizophrenics (schizophrenic 'defect')] Lange E, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1981 Jan;33(1):34–8 (Eng. Abstr.) **(Ger)**

[Therapy of elderly depressive patients. Lofepramine and amitriptyline under double-blind conditions] Jessel HJ, et al. **ZFA (Stuttgart)** 1981 Apr 10;57(10):784–8 **(Ger)**

DIBENZOTHIEPINS

High doses of clorotepin in chronic schizophrenia (preliminary report). Bastecký J, et al. **Agressologie** 1980;21(A):31–5

Simultaneous measurement of dothiepin and its major metabolites in plasma and whole blood by gas chromatography-mass fragmentography. Maguire KP, et al. **J Chromatogr** 1981 Mar 13; 222(3):399–408

A double-blind study of dothiepin hydrochloride (Prothiaden) and amitriptyline in out-patients with masked depression. Dahl LE, et al. **J Int Med Res** 1981;9(2):103–7

A comparison of the therapeutic and cardiovascular effects of a single nightly dose of Prothiaden (dothiepin, dosulepin) and Lentizol (sustained-release amitriptyline) in depressed elderly patients. Khan AU. **J Int Med Res** 1981;9(2):108–12

Clinical interpretation of pharmacokinetic data on dothiepin hydrochloride (Dosulepin, Prothiaden). Rees JA. **J Int Med Res** 1981; 9(2):98–102

[Comparison of blood and bile levels of oxyprothepine and docloxythepin in rats] Queisnerová M, et al. **Cesk Farm** 1981 Feb;30(1):14–5 (Eng. Abstr.) **(Cze)**

DIBENZOXAZEPINES

The effect of amoxapine and imipramine on serum prolactin levels. Cooper DS, et al. **Arch Intern Med** 1981 Jul;141(8):1023–5

Amoxapine: a review of literature. Ban TA, et al. **Int Pharmacopsychiatry** 1980;15(3):166–70 (21 ref.)

Postmortem blood and tissue levels of loxapine and its metabolites. Cooper TB, et al. **J Anal Toxicol** 1981 Mar–Apr;5(2):99–100

A critical appraisal of amoxapine. Smith RS Jr, et al. **J Clin Psychiatry** 1981 Jun;42(6):238–42

DIIODOTYROSINE

Changes of receptor cooperation in Tetrahymena by re-exposure to hormones. Csaba G, et al. **Acta Biol Acad Sci Hung** 1980; 31(1–3):43–7

Enhancement of the sensitivity of Tetrahymena to a second hormonal influence by hormone pretreatment. Csaba G, et al. **Acta Biol Med Ger** 1980;39(10):1027–30

Horseradish peroxidase. XLII. Oxidations of L-tyrosine and 3,5-diiodo-L-tyrosine by compound II. Ralston IM, et al. **Can J Biochem** 1980 Nov;58(11):1270–6

DISCRIMINATION (PSYCHOLOGY)

Effects of pimozide on nordiscriminated and discriminated performance in the pigeon. Tombaugh TN. **Psychopharmacology (Berlin)** 1981; 73(2):137–41

DISCRIMINATION LEARNING

Characteristics of the stimulus produced by the mixture of cannabidiol with delta 9-tetrahydrocannabinol. Zuardi AW, et al. **Arch Int Pharmacodyn Ther** 1981 Jan;249(1):137–46

Role of training conditions in discrimination of central nervous system stimulants by rats. Stolerman IP, et al. **Psychopharmacology (Berlin)** 1981;73(3):295–303

DOPA

Pronounced formation of 5-OH-dopa at enzymatic oxidation of DOPA in the presence of ascorbic acid. Hansson C, et al. **Acta Derm Venereol (Stockh)** 1981;61(2):147–8

Urinary excretion of 5-S-cysteinyldopa in healthy Japanese. Morishima T, et al. **Acta Derm Venereol (Stockh)** 1981;61(2):149–50

Specific colorimetric detection of o-diphenols and 3,4-dihydroxyphenylalanine-containing peptides. Waite JH, et al. **Anal Biochem** 1981 Feb;111(1):131–6

Formation of cysteine conjugates from dihydroxyphenylalanine and its S-cysteinyl derivatives by peroxidase-catalyzed oxidation. Ito S, et al. **Biochim Biophys Acta** 1981 Jan 21;672(2):151–7

Studies related to the blood-brain barrier to monoamines and protein in pia-arachnoid cultures. Hervonen H, et al. **Brain Res** 1981 Apr 6; 210(1–2):449–54

Identification of cysteinyldopa-derived units in eumelanins from mammalian eyes. Novellino E, et al. **FEBS Lett** 1981 Mar 9; 125(1):101–3

Chronic L–DOPA treatment of mice: a behavioural and biochemical study. Bailey R, et al. **J Neural Transm** 1981;50(2–4):209–24

DOPAMINE

The effect of dopamine on prolactin cells in vivo. Warchol JB, et al. **Acta Med Pol** 1980;21(4):403–4

Influence of estrogens on tuberoinfundibular and striatal dopaminergic systems in the rat. Labrie F, et al. **Acta Psychiatr Belg** 1980 Sep–Oct; 80(5):658–73

Changes in cardiovascular and renal function during catecholamine infusions in developing swine. Buckley NM, et al. **Am J Physiol** 1981 Apr;240(4):F276–81

Resumption of prolactin secretion after dopaminergic inhibition: differential effects of dopamine and its agonists. Woolf PD. **Am J Physiol** 1981 Jun;240(6):E700–4

Role of calmodulin in dopaminergic transmission. Hanbauer I, et al. **Ann NY Acad Sci** 1980;356:292–303

Treatment of massive phenobarbital overdose with dopamine diuresis. Costello JB, et al. **Arch Intern Med** 1981 Jun;141(7):938–40

Role of the neostriatal dopaminergic activity in sequencing and selecting behavioural strategies: facilitation of processes involved in selecting the best strategy in a stressful situation. Cools AR. **Behav Brain Res** 1980 Oct;1(5):361–78

Phenylethylamine effects on dopamine synthesis. Structure–activity relationships. Patrick RL. **Biochem Pharmacol** 1981 Jan 15; 30(2):141–6

Development of dopaminergic properties in cultured neurons from chick embryo cerebral hemispheres. Louis JC, et al. **Biochem Soc Trans** 1981 Feb;9(1):104–5

Effect of stress and ACTH on dopamine metabolism in the nucleus accumbens and frontal cortex. Fadda F, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):454–8

Ibopamine (SB 7505) in normal subjects and in chronic renal failure: a preliminary report. Stefoni S, et al. **Br J Clin Pharmacol** 1981 Jan; 11(1):69–72

Relationship between the presence of dopaminergic neurons and GABA receptors in substantia nigra: effects of lesions. Gale K. **Brain Res** 1981 Apr 6;210(1–2):401–6

Dopamine–activated adenylate cyclase of spinal cord: supersensitivity following transection of the cord. Gentleman S, et al. **Brain Res** 1981 Apr 6;210(1–2):271–5

Regional changes in brain catecholamine turnover in the rat during performance on fixed ratio and variable interval schedules of reinforcement. Heffner TG, et al. **Brain Res** 1981 Jun 9; 214(1):215–8

The relationship between loss of dopamine nerve terminals, striatal [3H]spiroperidol binding and rotational behavior in unilaterally 6–hydroxydopamine–lesioned rats. Heikkila RE, et al. **Brain Res** 1981 May 4;211(2):285–92

Regional differences in catecholamine formation and metabolism in the rat spinal cord. Karoum F, et al. **Brain Res** 1981 May 18; 212(2):361–6

Effects of methamphetamine on blood flow in the caudate–putamen after lesions of the nigrostriatal dopaminergic bundle in the rat. Lindvall O, et al. **Brain Res** 1981 Apr 27;211(1):211–6

Altered succinate dehydrogenase activity of basal ganglia following to mesotelencephalic dopaminergic projection. Marshall JF, et al. **Brain Res** 1981 May 18;212(2):367–77

The role of GABA in the regulation of the dopamine/tyrosine hydroxylase–containing neurons of the rat retina. Marshburn PB, et al. **Brain Res** 1981 Jun 15;214(2):335–47

Ontogenetic development of high potassium– and acetylcholine–induced release of dopamine from striatal slices of the rat. Nomura Y, et al. **Brain Res** 1981 Apr;227(2):171–7

Decreased dopamine turnover in the median eminence in response to suckling in the lactating rat. Selmanoff M, et al. **Brain Res** 1981 May 11;212(1):101–15

Genotypic influences on striatal dopaminergic regulation in mice. Severson JA, et al. **Brain Res** 1981 Apr 6;210(1–2):201–15

Intracranial self–stimulation: mapping against the lateral boundaries of the dopaminergic cells of the substantia nigra. Wise RA. **Brain Res** 1981 May 25;213(1):190–4

Microspectrofluorometric study of monoamines in the auricle of the heart of Protopterus aethiopicus. Scheuermann DW, et al. **Cell Tissue Res** 1981;217(2):443–9

Clinical processes and central dopaminergic activity in psychotic disorders. Bowers MB Jr, et al. **Commun Psychopharmacol** 1980; 4(3):177–83

Plasma norepinephrine, epinephrine, and dopamine concentrations in maternal and fetal sheep during spontaneous parturition and in premature sheep during cortisol–induced parturition. Eliot RJ, et al. **Endocrinology** 1981 May;108(5):1678–82

Dopamine in hypophysial portal plasma and prolactin in systemic plasma of rats treated with 5–hydroxytryptamine. Pilotte NS, et al. **Endocrinology** 1981 Jun;108(6):2137–41

Negative feedback effects of progesterone correlated with changes in hypothalamic norepinephrine and dopamine turnover rates, median eminence luteinizing hormone–releasing hormone, and peripheral plasma gonadotropins. Rance N, et al. **Endocrinology** 1981 Jun; 108(6):2194–9

The lateral and medial median eminence: distribution of dopamine, norepinephrine, and luteinizing hormone–releasing hormone and the effect of prolactin on catecholamine turnover. Selmanoff M. **Endocrinology** 1981 May;108(5):1716–22

Effects of estradiol and progesterone on catecholamine turnover rates in discrete hypothalamic regions in ovariectomized rats. Wise PM, et al. **Endocrinology** 1981 Jun;108(6):2186–93

Dopamine neurons of the retina: a simple method system for studying synaptic regulatory mechanisms. Iuvone PM, et al. **Essays Neurochem Neuropharmacol** 1981;5:75–94 (35 ref.)

Renal effect of SB 7505: a double–blind study. Melloni GF, et al. **Eur J Clin Pharmacol** 1981 Feb;19(3):177–80

Biochemical mechanism of tolerance to neuroleptic drugs; regional differences in rat brain. Bacopoulos NG. **Eur J Pharmacol** 1981 Apr 9;70(4):585–6

Methylphenidate–like stimulants in vitro release [3H]tyramines but not [14C]dopamine. Dyck LE. **Eur J Pharmacol** 1981 Jan 29;69(3):371–4

GABA enhancement of [3H]dopamine release from slices of rat striatum: dependence on slice size. Ennis C, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):417–20

GABA antagonists enhance dopamine turnover in the rat retina in vivo. Kamp CW, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):273–9

Postsynaptic inhibitory actions of catecholamines and opioid peptides in the bed nucleus of the stria terminalis. Sawada S, et al. **Exp Brain Res** 1981;41(3–4):264–70

Effects of the optical isomers of 2–amino–3–fluoro–1–phenylpropane (monofluoroamphetamine) hydrochloride on uptake and release of dopamine in rat striatum in vitro. Benderly A, et al. **Experientia** 1981 Mar 15;37(3):294–5

Effect of apomorphine hydrochloride administration on serum concentrations of prolactin and growth hormone in cattle. Gorewit RC. **Experientia** 1981 Feb 15;37(2):204–6

Lesions in the substantia nigra of rats induce thermoregulatory deficit in the cold. Lin MT, et al. **Experientia** 1981 Mar 15;37(3):284–6

Pharmacological characterization of the dopaminergic stimulation of mucociliary particle transport by Mytilus edulis gill. Malanga CJ, et al. **Gen Pharmacol** 1981;12(3):139–44

Catecholamine turnover in rat cerebral cortex and caudate following repeated treatment with dihydroergotoxine. Cvejić V, et al. **Gerontology** 1981;27(1–2):7–12

Studies on the uptake of [3H]dopamine by synaptic vesicle fraction isolated from bovine brain. Tsudzuki T. **J Biochem (Tokyo)** 1981 Jan; 89(1):61–9

Amine transport in chromaffin granule ghosts. pH dependence implies cationic form is translocated. Knoth J, et al. **J Biol Chem** 1981 Jul 10; 256(13):6541–3

Simultaneous determination of dopamine, DOPAC and homovanillic acid. Direct injection of supernatants from brain tissue homogenates in a liquid chromatography––electrochemical detection system. Magnusson O, et al. **J Chromatogr** 1980 Dec 12;221(2):237–47

Determination of dopamine, homovanillic acid and 3,4–dihydroxyphenylacetic acid in rat brain striatum by high–performance liquid chromatography with electrochemical detection. Saraswat LD, et al. **J Chromatogr** 1981 Mar 13; 222(3):353–62

Decreased plasma and urinary dopamine during dietary sodium depletion in man. Carey RM, et al. **J Clin Endocrinol Metab** 1981 May; 52(5):903–9

Behavioral and neurochemical effects of neonatal administration of monosodium L–glutamate in mice. Dawson R Jr, et al. **J Comp Physiol Psychol** 1981 Feb;95(1):71–84

Chronic L–DOPA treatment of mice: a behavioural and biochemical study. Bailey R, et al. **J Neural Transm** 1981;50(2–4):209–24

3–Methoxytyramine and normetanephrine as indicators of dopamine and noradrenaline release in mouse brain in vivo. Kehr W. **J Neural Transm** 1981;50(2–4):165–78

Effects of dopamine on cyclic AMP concentration in the anterior pituitary gland in vitro. Pawlikowski M, et al. **J Neural Transm** 1981; 50(2–4):179–84

Role of phospholipids in coupling of adenosine and dopamine receptors to striatal adenylate cyclase. Anand–Srivastava MB, et al. **J Neurochem** 1981 May;36(5):1819–28

Conversion of 3, 4–dihydroxyphenylalanine and deuterated 3, 4–dihydroxyphenylalanine to alcoholic metabolites of catecholamines in rat brain. Edwards DJ, et al. **J Neurochem** 1981 May; 36(5):1641–7

The effect of mesencephalic lesions on tyramine and dopamine in the caudate nucleus of the rat. Juorio AV, et al. **J Neurochem** 1981 Jun; 36(6):1898–903

Effects of in vivo amphetamine administration on dopamine synthesis regulation in rat brain striatal synaptosomes. Patrick RL, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):686–91

Simultaneous radioenzymatic assay of dopamine and dihydroxyphenylacetic acid: an index of in vivo dopamine release. Cheng CH, et al. **J Pharmacol Methods** 1981 Mar;5(2):165–73

Cross-tolerance of dopamine metabolism to baclofen, gamma-butyrolactone and HA-966 in the striatum and olfactory tubercle of the rat. Broxterman HJ, et al. **Life Sci** 1981 Mar 2; 28(9):973–81

Decreased ability to cope with heat and cold linked to a dysfunction in a central dopaminergic pathway in elderly rats. Cox B, et al. **Life Sci** 1981 May 4;28(18):2039–44

Disruption of 5-hydroxytryptaminergic neuronal function blocks the action of morphine on tuberoinfundibular dopaminergic neurons. Demarest KT, et al. **Life Sci** 1981 Mar 23;28(12):1345–51

I. Catecholamines in developing rat lung. Gardey-Levassort C, et al. **Life Sci** 1981 Jan 26;28(4):331–7

Dopamine-inhibited adenylate cyclase in female rat adenohypophysis. Giannattasio G, et al. **Life Sci** 1981 Apr 6;28(14):1605–12

The effect of phencyclidine on dopamine metabolism in the mouse brain. Johnson KM, et al. **Life Sci** 1981 Jan 26;28(4):361–9

Passive avoidance performance correlates with catecholamine turnover in discrete limbic brain regions. Kovács GL, et al. **Life Sci** 1981 Mar 9;28(10):1109–16

Dose-dependent and reversible effects of lead on rat dopaminergic system. Memo M, et al. **Life Sci** 1981 Feb 16;28(7):795–9

Dopamine and norepinephrine uptake and metabolism by astroglial cells in culture. Pelton EW 2d, et al. **Life Sci** 1981 Apr 6;28(14):1655–63

Direct measurement of the effect of potassium, calcium, veratridine, and amphetamine on the rate of release of dopamine from superfused brain tissue. Wightman RM, et al. **Life Sci** 1981 Mar 16;28(11):1279–86

Dopamine in pediatric therapy. Foster SD. **MCN** 1981 Jul–Aug; 6(4):279

Mesocortical dopamine neurons. Lack of autoreceptors modulating dopamine synthesis. Bannon MJ, et al. **Mol Pharmacol** 1981 Mar; 19(2):270–5

Effect of calmodulin on dopamine-sensitive adenylate cyclase activity in rat striatal membranes. Gnegy M, et al. **Mol Pharmacol** 1981 Mar; 19(2):256–63

Neurotensin blocks certain amphetamine-induced behaviours. Ervin GN, et al. **Nature** 1981 May 7;291(5810):73–6

The rate constants for the efflux of deaminated metabolites of 3H-dopamine from the perfused rat heart. Bönisch H. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):231–5

Direct and indirect actions of dopamine on tracheal smooth muscle. Koga Y, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980;315(1):15–20

Experimental studies on the development of sex differences in the release of dopamine from striatal tissue fragments in vitro. Becker JB, et al. **Neuroendocrinology** 1981 Mar;32(3):168–73

Dopamine levels in hypophysial stalk plasma and prolactin levels in peripheral plasma of the lactating rat: effects of a simulated suckling stimulus. de Greef WJ, et al. **Neuroendocrinology** 1981 Apr; 32(4):229–33

Further studies on dopamine-induced suppression of pulsatile LH release in ovariectomized rats. Gallo RV. **Neuroendocrinology** 1981 Mar; 32(3):187–92

Monoamine uptake into synaptosomes from various regions of rat brain following lithium administration and withdrawal. Ahluwalia P, et al. **Neuropharmacology** 1981 May;20(5):483–7

Injections of dopaminergic, cholinergic, serotoninergic and GABAergic drugs into the nucleus accumbens: effects on locomotor activity in the rat. Jones DL, et al. **Neuropharmacology** 1981 Jan;20(1):29–37

Effects of estrogens on the responses of caudate neurons to microiontophoretically applied dopamine. Arnauld E, et al. **Neurosci Lett** 1981 Feb 6;21(3):325–31

Effects of chronic estrogen treatment on dopamine concentrations and turnover in discrete brain nuclei of ovariectomized rats. Dupont A, et al. **Neurosci Lett** 1981 Feb 23;22(1):69–74

Dopaminergic mediation of reward: evidence gained using a natural reinforcer in a behavioral contrast paradigm. Royall DR, et al. **Neurosci Lett** 1981 Jan 20;21(2):223–9

Involvement of serotonin and catecholamine metabolism in cats trained to perform a delayed response task. Vachon L, et al. **Neuroscience** 1981; 6(2):189–94

Is there a non-dopaminergic nigrostriatal pathway? van der Kooy D, et al. **Neuroscience** 1981;6(3):345–57

Effects of a high-dose treatment of methamphetamine on caudate dopamine and anorexia in rats. Bittner SE, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):481–6

Septal lesions and avoidance behavior: genetic, neurochemical and behavioral considerations. Donovick PJ, et al. **Physiol Behav** 1981 Mar; 26(3):495–507

Target neuron-specific process formation by embryonic mesencephalic dopamine neurons in vitro. Hemmendinger LM, et al. **Proc Natl Acad Sci USA** 1981 Feb;78(2):1264–8

Dopamine and depolarizing agents regulate the state of phosphorylation of protein I in the mammalian superior cervical sympathetic ganglion. Nestler EJ, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7479–83

Chromosomes in living Escherichia coli cells are segregated into domains of supercoiling. Sinden RR, et al. **Proc Natl Acad Sci USA** 1981 Jan; 78(1):224–8

Dopaminergic involvement in attention. A novel animal model. Katz RJ, et al. **Prog Neuropsychopharmacol** 1980;4(6):585–90

Psychopharmacology of anorectic drugs in man. Silverstone T. **Prog Neuropsychopharmacol** 1980;4(4–5):371–4

The effect of altered dopaminergic activity on food intake in the rat: evidence for an optimal level of dopaminergic activity for behavior. Zigmond MJ, et al. **Prog Neuropsychopharmacol** 1980;4(4–5):351–62

Slow and rapid onset of manic episodes: implications for underlying biology. Post RM, et al. **Psychiatry Res** 1981 Apr;4(2):229–37

The effect of long-term concurrent administration of chlorpromazine and lithium on the striatal and frontal cortical dopamine metabolism in rats. Eroğlu L, et al. **Psychopharmacology (Berlin)** 1981;73(1):84–6

Dopaminergic agonists differentially affect open-field activity of rats with A10 lesions. Hodge GK, et al. **Psychopharmacology (Berlin)** 1981; 73(1):39–42

Increased mesolimbic dopamine binding following chronic haloperidol treatment. Kamer RS, et al. **Psychopharmacology (Berlin)** 1981; 72(3):261–3

Is dopamine an inhibitory modulator of gastrointestinal motility? Schuurkes JA, et al. **Scand J Gastroenterol [Suppl]** 1981;67:33–6

Phosphatidate as a molecular link between depolarization and neurotransmitter release in the brain. Harris RA, et al. **Science** 1981 Jun 12;212(4500):1290–1

Cerebral blood flow and intracranial pressure in the dog during intravenous infusion of nitroglycerin alone and in combination with dopamine. von Essen C, et al. **Stroke** 1981 May–Jun;12(3):331–8

3,4,3',4'-Tetrachlorobiphenyl given to mice prenatally produces long-term decreases in striatal dopamine and receptor binding sites in the caudate nucleus. Agrawal AK, et al. **Toxicol Lett** 1981 Mar; 7(6):417–24

[A study of renovation rate of dopamine and 5-hydroxytryptamine in brain in chronic schizophrenics (author's transl)] Shen YC. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1979;12(3):158–60 (Chi)

[A case of poisoning with anuria and circulatory failure treated with dopamine infusion] Nielsen HV, et al. **Ugeskr Laeger** 1981 13 Apr; 143(16):1017–8 (Eng. Abstr.) (Dan)

[The dopaminergic innervation of neostriatum: a new possibility of radioautographic investigation (author's transl)] Descarries L, et al. **J Physiol (Paris)** 1981 Apr;77(1):53–61 (Eng. Abstr.) (Fre)

[Influence of dopamine on pars reticulata neurones of substantia nigra (author's transl)] Ruffieux A, et al. **J Physiol (Paris)** 1981 Apr; 77(1):63–9 (Eng. Abstr.) (Fre)

[Dopaminergic A10 neurons and frontal system (author's transl)] Simon H. **J Physiol (Paris)** 1981 Apr;77(1):81–95 (Eng. Abstr.) (Fre)

[Effect of a new gastrokinetic drug on gastrointestinal motility: domperidone, a peripheral antidopaminergic drug] Chevrel B. **Med Chir Dig** 1981;10(2):175–8 (Fre)

[Dopamine in the management of septic shock states] Daoud A, et al. **Tunis Med** 1981 Jan–Feb;59(1):848–51 (Eng. Abstr.) (Fre)

[Effect of reserpine on monoamine uptake by rat brain synaptosomes] Blaschke M, et al. **Acta Biol Med Ger** 1980;39(11–12):1205–12 (Eng. Abstr.) (Ger)

[Effect of social isolation on the transmitter sensitivity of striatal and hippocampal neurons of the rat] Oehler J, et al. **Acta Biol Med Ger** 1980;39(10):1089–93 (Eng. Abstr.) (Ger)

[Mechanisms of the renal action of dopamine and their dependence on changes in the sodium balance. II. Studies on water-salt depletion] Agnoli GC, et al. **Boll Soc Ital Cardiol** 1979;24(12):1331–49 (Ita)

[Mechanisms of the renal action of dopamine and thier dependence on changes in sodium balance. Studies on water-salt retention] Agnoli GC, et al. **Boll Soc Ital Cardiol** 1979;24(12):1315–29 (Ita)

DOPAMINE BETA-HYDROXYLASE

Immunofluorescent and biochemical studies on dopamine-beta-hydroxylase and catecholamines in SIF cells of the superior cervical ganglion. Heym C, et al. **Acta Histochem [Suppl] (Jena)** 1981;24:123–9

Urinary catecholamine excretion and plasma dopamine-beta-hydroxylase activity during mental work performed in some periods of menstrual cycle in women. Wasilewska E, et al. **Acta Physiol Pol** 1980; 31(6):647–51

Catecholamine synthesis in the adrenal medulla of cattle and rats deficient in copper. Hesketh JE. **Biochem Soc Trans** 1981 Feb;9(1):101–2

Effect of nerve activity on transport of nerve growth factor and dopamine beta-hydroxylase antibodies in sympathetic neurones. Lees G, et al. **Brain Res** 1981 Jun 9;214(1):186–9

Inhibition of LH and prolactin release in the cycling rat following inhibition of dopamine-beta-hydroxylase. Voogt JL, et al.

Brain Res 1981 Mar 30;209(2):411-9

Fluorimetric assay for dopamine beta-hydroxylase in rat plasma. Ohkura Y, et al. **Chem Pharm Bull (Tokyo)** 1980 Nov;28(11):3385-8

Plasma DBH activity: relation to genetic factors in schizophrenia. Baron M, et al. **Commun Psychopharmacol** 1980;4(3):197-202

Role of glucocorticoids in expression of the adrenergic phenotype in rat embryonic adrenal gland. Bohn MC, et al. **Dev Biol** 1981 Feb; 82(1):1-10

Plasma dopamine beta hydroxylase activity in chronic schizophrenic patients tested with single dose of 2-bromo-alpha ergocriptine (Parlodel). Vardi J, et al. **Encephale** 1981;7(1):95-103

Human plasma dopamine-beta-hydroxylase: oxygen and thermal stability. Dunnette J, et al. **Experientia** 1981 Feb 15;37(2):115-7

Circadian rhythms of dopamine-beta-hydroxylase and c-AMP in plasma of controls and patients with affective disorders. Markianos M, et al. **J Neural Transm** 1981;50(2-4):149-55

Phentolamine increases neuronal binding and retrograde transport of dopamine beta-hydroxylase antibodies. Lees GJ, et al. **Neurosci Lett** 1981 Mar 10;22(2):115-8

Interaction of opiate peptide and noradrenalin systems: light microscopic studies. Watson SJ, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):23-30

Serum DBH and platelet MAO in patients with depressive disorders. Honecker H, et al. **Pharmacopsychiatria** 1981 Jan;14(1 Suppl):10-4

The hyperactive child syndrome: peripheral sympathetic nervous system function and the effect of d-amphetamine. Mikkelsen E, et al. **Psychiatry Res** 1981 Apr;4(2):157-69

[Plasma dopamine beta-hydroxylase activity in endogenous depressive syndromes] Pużyński S, et al. **Psychiatr Pol** 1980 Nov-Dec; 14(6):581-6 (Eng. Abstr.) (Pol)

DOXEPIN

Doxepin, a tricyclic antidepressant, binds to normal, intact astroglial cells in cultures and inhibits the isoproterenol-induced increase in cyclic AMP production. Hertz L, et al. **Can J Physiol Pharmacol** 1980 Dec; 58(12):1515-9

[3H]doxepin interactions with histamine H1-receptors and other sites in guinea pig and rat brain homogenates. Tran VT, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):501-9

DRUG INTERACTIONS

What to watch for with lithium. Rosenberg JM, et al. **RN** 1981 Jul; 44(7):44-6

DRUG TOLERANCE

Biochemical mechanism of tolerance to neuroleptic drugs; regional differences in rat brain. Bacopoulos NG. **Eur J Pharmacol** 1981 Apr 9;70(4):585-6

ELECTROCONVULSIVE THERAPY

Effect of antidepressants, lithium and electroconvulsive treatment on rat serum prolactin levels. Meltzer HY, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):100-21

Electroconvulsive therapy and receptor sensitivity. Modigh K, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):91-9

The medically ill elderly, tricyclic response, and ECT [letter] Small G, et al. **Am J Psychiatry** 1981 May;138(5):703-4

Convulsive and drug therapies of depression. Fink M. **Annu Rev Med** 1981;32:405-12 (71 ref.)

Auditory brain stem evoked responses in hospitalized patients undergoing drug treatment or ECT. Small JG, et al. **Biol Psychiatry** 1981 Mar; 16(3):287-90

ELECTROENCEPHALOGRAPHY

Effect of p-chlorophenylalanine and tryptophan on sleep, EEG and motor activity in the rat. Borbély AA, et al. **Behav Brain Res** 1981 Jan; 2(1):1-22

Lisuride and cerebral electrical activity in the rabbit. Bo P, et al. **Farmaco [Sci]** 1981 May;36(5):351-8

Effect of pentobarbital on thalamo- and hippocampocortical processes in rats. Kolinová M, et al. **Physiol Bohemoslov** 1981;30(2):139-48

An objective classification of psychoactive drugs. Fink M. **Prog Neuropsychopharmacol** 1980;4(4-5):495-502

Computer analyzed EEG in amphetamine-responsive hyperactive children. McIntyre HB, et al. **Psychiatry Res** 1981 Apr;4(2):189-97

[The use of electrophysiological techniques to project typical psychotropic drug effects: some examples (author's transl)] Herrmann WM, et al. **EEG EMG** 1981 Mar;12(1):21-32 (Eng. Abstr.) (Ger)

[The effect of clonazepam on visual evoked potentials of the rabbit (author's transl)] Pockberger H, et al. **EEG EMG** 1981 Mar; 12(1):14-20 (Eng. Abstr.) (Ger)

ELECTROLYTES

Methylprednisolone stimulation of guanylate cyclase activity in rat small intestinal mucosa: possible rôle in electrolyte transport. Marnane WG, et al. **Gastroenterology** 1981 Jul;81(1):90-100

ELECTROSHOCK

Effect of stress and ACTH on dopamine metabolism in the nucleus accumbens and frontal cortex. Fadda F, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):454-8

The effects of electric shock on responding maintained by cocaine in rhesus monkeys. Bergman J, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):423-6

Repeated electroconvulsive shock prevents the sedative effect of small doses of apomorphine. Serra G, et al. **Psychopharmacology (Berlin)** 1981; 73(2):194-6

The effects of electroconvulsive shock on the discriminative stimulus properties of d-amphetamine and apomorphine: evidence for dopamine receptor alteration subsequent ECS. White DK, et al. **Psychopharmacology (Berlin)** 1981;73(3):211-4

EMOTIONS

The effect of bromazepam on psychomotor activity and subjective mood. Hobi V, et al. **J Int Med Res** 1981;9(2):89-97

[On the effect of imipramine on blood composition, glucose level and alkaline phosphatase activity of leucocytes in non-emotive Wistar rats and animals of inbred TMB strain (author's transl)] Freund D, et al. **Arzneimittelforsch** 1981;31(3):425-8 (Eng. Abstr.) (Ger)

[Catecholamines in the brain structures of rats responding differently to the 'open field' test] Belova TI, et al. **Biull Eksp Biol Med** 1981 Feb; 91(2):136-8 (Eng. Abstr.) (Rus)

ENDORPHINS

Light and electron microscopic localization of enkephalin and tyrosine hydroxylase in neostriatum of fetal and adult rat brain. Pickel VM, et al. **Acta Histochem [Suppl] (Jena)** 1981;24:97-105

Immunoreactive endorphin peptides and prolactin in umbilical vein and maternal blood. Kimball CD, et al. **Am J Obstet Gynecol** 1981 May 15;140(2):157-64

Role of adrenergic blocking agents and glucocorticoids on the regulation of pituitary opioid peptides levels. Giagnoni G, et al. **Arch Int Pharmacodyn Ther** 1980 Dec;248(2):272-9

Met-enkephalin-Arg6-Phe7 metabolism: conversion to Met-enkephalin by brain and kidney dipeptidyl carboxypeptidases. Benuck M, et al. **Biochem Biophys Res Commun** 1981 Mar 31;99(2):630-6

The complete amino acid sequence of alpha-neo-endorphin. Kangawa K, et al. **Biochem Biophys Res Commun** 1981 Apr 15;99(3):871-8

Proposals for conformation of enkephalins related to opiate mu-pharmacophore. Maigret B, et al. **Biochem Biophys Res Commun** 1981 Mar 16;99(1):267-74

Beta-neo-endorphin, a new hypothalamic 'big' Leu-enkephalin of porcine origin: its purification and the complete amino acid sequence. Minamino N, et al. **Biochem Biophys Res Commun** 1981 Apr 15;99(3):864-70

Behavioral activity of met-enkephalin and ACTH4-10 and other peptides containing a phenylalanine and methionine residue. Rigter H, et al. **Biochem Biophys Res Commun** 1981 Jan 30;98(2):424-30

De novo biosynthesis of enkephalins and their homologues in the human placenta. Tan L, et al. **Biochem Biophys Res Commun** 1981 Feb 12; 98(3):752-60

Purification and substrate characterization of a human enkephalin-degrading aminopeptidase. Coletti-Previero MA, et al. **Biochim Biophys Acta** 1981 Jan 15;657(1):122-7

Serotonergic and peptidergic projections to the spinal cord demonstrated by a combined retrograde HRP histochemical and immunocytochemical staining method. Bowker RM, et al. **Brain Res** 1981 May 4; 211(2):412-7

A study of 24-hour profiles of plasma met-enkephalin in man. Shanks MF, et al. **Brain Res** 1981 May 18;212(2):403-9

Enkephalin and zinc in the hippocampal mossy fiber System. Stengaard-Pedersen K, et al. **Brain Res** 1981 May 11;212(1):230-3

Release of beta-lipotropin and beta-endorphin from rat hypothalami in vitro. Vermes I, et al. **Brain Res** 1981 Apr 27;211(1):248-54

Development of radioimmunoassayable beta-endorphin and methionine-enkephalin binding sites in regions of rat brain. Tsang D, et al. **Can J Physiol Pharmacol** 1980 Aug;58(8):947-50

Ultrastructural localization of corticotropin, beta-lipotropin, and alpha- and beta-endorphin in the porcine anterior pituitary. Dacheux F. **Cell Tissue Res** 1981;215(1):87-101

Nerves containing substance P, vasoactive intestinal polypeptide, enkephalin or somatostatin in the guinea-pig taenia coli. Distribution, ultrastructure and possible functions. Leander S, et al. **Cell Tissue Res** 1981;215(1):21-39

Cytological localization of alpha-MSH, ACTH and beta-endorphin in the pars intermedia of the cichlid teleost Sarotherodon mossambicus.

van Eys GJ, et al. **Cell Tissue Res** 1981;215(3):625–33

Presence of beta–endorphin–like immunoreactivity in the anterior pituitary gland of rat and man and evidence for the differential localization with ACTH. Watkins WB, et al. **Cell Tissue Res** 1981; 215(3):577–89

Structure and biosynthesis of pro–adrenocorticotropin/endorphin and related peptides. Eipper BA, et al. **Endocr Rev** 1980 Winter; 1(1):1–27 (186 ref.)

Effect of intraventricular injection of neurotensin and other various bioactive peptides on plasma immunoreactive somatostatin levels in rat hypophysial portal blood. Abe H, et al. **Endocrinology** 1981 May; 108(5):1939–43

Evidence for two different turnover pools of adrenocorticotropin, alpha–melanocyte–stimulating hormone, and endorphin–related peptides released by the frog pituitary neurointermediate lobe. Loh YP, et al. **Endocrinology** 1981 Jul;109(1):54–61

Comparison of acute effects of dynorphin and beta–endorphin on prolactin release in the rat. Van Vugt DA, et al. **Endocrinology** 1981 May; 108(5):2017–8

Effects of hypoxia on beta–endorphin and beta–lipotropin release in fetal, newborn, and maternal sheep. Wardlaw SL, et al. **Endocrinology** 1981 May;108(5):1710–5

Differential loss of biological activity of the enkephalins induced by current. Kitchen I, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):393–6

Postsynaptic inhibitory actions of catecholamines and opioid peptides in the bed nucleus of the stria terminalis. Sawada S, et al. **Exp Brain Res** 1981;41(3–4):264–70

Opioid peptide precursors in striatum. Beaumont A, et al. **FEBS Lett** 1980 Dec 15;122(1):135–7

Failure of somatostatin and beta–endorphin to affect bovine adrenal cortex cells in vitro. Diel F, et al. **Horm Metab Res** 1981 Feb;13(2):95–8

Endocrine effect of a methionine–enkephalin derivative (FK 33–824) in man. del Pozo E, et al. **Horm Res** 1980;13(2):90–7

Beta–endorphin: synthesis and radioligand binding activity of analogs containing cystine bridges. Blake J, et al. **Int J Pept Protein Res** 1981 Feb;17(2):239–42

Use of the chromogenic p–(p–(dimethylamino)phenylazo) benzyl (AZ) ester in the synthesis of leu–enkephalin. Reynolds GD, et al. **Int J Pept Protein Res** 1981 Feb;17(2):231–4

Human beta–endorphin: synthesis and biological activity of analogs with substitutions in positions 2, 9, 18, 27 and 31. Yeung HW, et al. **Int J Pept Protein Res** 1981 Feb;17(2):235–8

Differentiation of MSH–, ACTH–, endorphin–, and LPH–containing cells in the hypophysis during embryonic and fetal development. Dupouy JP. **Int Rev Cytol** 1980;68:197–249 (277 ref.)

Further analysis of post–translational processing of beta–endorphin in rat intermediate pituitary. Eipper BA, et al. **J Biol Chem** 1981 Jun 10; 256(11):5689–95

Differences in the post–translational processing of beta–endorphin in rat anterior and intermediate pituitary. Mains RE, et al. **J Biol Chem** 1981 Jun 10;256(11):5683–8

The interaction of N alpha–alkylenkephalins with opiate receptors. Tissue–dependent shifts in the opiate activity of methionine–enkephalin following N alpha–alkylation. Summers MC, et al. **J Biol Chem** 1981 May 25;256(10):4951–6

Diurnal rhythm of plasma immunoreactive beta–endorphin and its relationship to sleep stages and plasma rhythms of cortisol and prolactin. Dent RR, et al. **J Clin Endocrinol Metab** 1981 May;52(5):942–7

Immunohistochemical localization of substance–P, somatostatin, and methionine–enkephalin in the spinal cord and dorsal root ganglia of the North American opossum, Didelphis virginiana. Ditirro FJ, et al. **J Comp Neurol** 1981 May 10;198(2):351–63

Localization of enkephalin–like immunoreactivity to identified axonal and neuronal populations of the rat hippocampus. Gall C, et al. **J Comp Neurol** 1981 May 10;198(2):335–50

Immunohistochemical localization of leucine–enkephalin in the spinal cord of the cat: enkephalin–containing marginal neurons and pain modulation. Glazer EJ, et al. **J Comp Neurol** 1981 Mar 1;196(3):377–89

Sex differences in the content of beta–endorphin and enkephalin–like peptides in the pituitary of obese (ob/ob) mice. Govoni S, et al. **J Neurochem** 1981 May;36(5):1829–33

Alpha–N–acetyl beta–endorphins in the pituitary: immunohistochemical localization using antibodies raised against dynorphin(1–13). Weber E, et al. **J Neurochem** 1981 Jun;36(6):1977–85

The effect of captopril and ascorbic acid on nonenzymatic methionine enkephalin inactivation in the guinea–pig ileum. Greenberg R, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):750–6

Is excitation by enkephalins of hippocampal neurones in the rat due to presynaptic facilitation or to disinhibition? Haas HL, et al. **J Physiol (Lond)** 1980 Nov;308:315–30

beta–Endorphin and related peptides. Imura H. **Jpn J Pharmacol** 1980; 30(Suppl):1P

Inhibition of gastric emptying by enkephalin analogue [letter] Sullivan SN, et al. **Lancet** 1981 Jul 11;2(8237):86–7

Potent tetrapeptide enkephalins. Chipkin RE, et al. **Life Sci** 1981 Mar 30;28(13):1517–22

The effect of running on plasma beta–endorphin. Colt EW, et al. **Life Sci** 1981 Apr 6;28(14):1637–40

Corticotropin/beta–endorphin immunoreactivity in rat mast cells. Peptide or protease? DiAugustine RP, et al. **Life Sci** 1980 Dec 22–29; 27(25–26):2663–8

Comparative study on the effect of morphine and the opioid–like peptides in the vas deferens of rodents: species and strain differences, evidence for multiple opiate receptors. Huidobro–Toro JP, et al. **Life Sci** 1981 Mar 23;28(12):1331–6

Des–tyrosine–gamma–endorphin: H–reflex response similar to neuroleptics. Metz J, et al. **Life Sci** 1981 May 4;28(18):2003–8

Episodic secretion of opioid activity in human plasma and monkey CSF: evidence for a diurnal rhythm. Naber D, et al. **Life Sci** 1981 Feb 23; 28(8):931–5

Conformation of beta–endorphin analogues in cerebroside sulfate solution. Wu CS, et al. **Mol Pharmacol** 1981 Mar;19(2):302–6

Dynorphin. Nathan B. Eddy memorial award lecture. Goldstein A. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(34):1–10

Presence of avian pancreatic polypeptide–like immunoreactivity in catecholamine and methionine–enkephalin–containing neurones within the central nervous system. Hunt SP, et al. **Neurosci Lett** 1981 Jan 20; 21(2):125–30

Retention of passive avoidance behavior in rats following alpha– and gamma–endorphin administration: effects of post–learning treatments. Kovács GL, et al. **Neurosci Lett** 1981 Feb 23;22(1):79–82

In vivo release of met–enkephalin in the cat brain. Cesselin F, et al. **Neuroscience** 1981;6(3):301–13

An immunohistochemical study of enkephalins and other neuropeptides in the striatum of the cat with evidence that the opiate peptides are arranged to form mosaic patterns in register with the striosomal compartments visible by acetylcholinesterase staining. Graybiel AM, et al. **Neuroscience** 1981;6(3):377–97

Localization of [Met5]– and [Leu5]–enkephalin–like immunoreactivity in nerve terminals in human paravertebral sympathetic ganglia. Hervonen A, et al. **Neuroscience** 1981;6(3):323–30

Human spinal neurons: innervation by both substance P and enkephalin. LaMotte CC, et al. **Neuroscience** 1981;6(4):713–23

Reserpine increases opiate–like peptide content and tyrosine hydroxylase activity in adrenal medullary chromaffin cells in culture. Wilson SP, et al. **Neuroscience** 1981;6(1):71–9

Tyrosine–modified analogs of methionine–enkephalin and their effects on the mouse vas deferens. Coy DH, et al. **Peptides (Fayetteville)** 1980 Summer;1(2):175–7

Radioimmunoassay of methionine(5)–enkephalin sulphoxide: phylogenetic and anatomical distribution. King JA, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):211–6

Tobacco mosaic virus–enkephalin conjugates: potentiation of opioid activity. Kriwaczek VM, et al. **Peptides (Fayetteville)** 1981 Spring; 2(1):89–92

Enkephalinase: selective inhibitors and partial characterization. Sullivan S, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):31–5

Interaction of opiate peptide and noradrenalin systems: light microscopic studies. Watson SJ, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):23–30

A cyclic enkephalin analog with high in vitro opiate activity. DiMaio J, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7162–6

Enkephalin–like immunoreactivity of olivocochlear nerve fibers in cochlea of guinea pig and cat. Fex J, et al. **Proc Natl Acad Sci USA** 1981 Feb; 78(2):1255–9

Two adrenal opioid polypeptides: proposed intermediates in the processing of proenkephalin. Stern AS, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1962–6

Dynorphin immunocytochemical localization in brain and peripheral nervous system: preliminary studies. Watson SJ, et al. **Proc Natl Acad Sci USA** 1981 Feb;78(2):1260–3

Classification of endorphins/enkephalins in brain physiology and pathology (based on EEG and clinical study of synthetically–modified methionine–enkephalin). Roubicek J, et al. **Prog Neuropsychopharmacol** 1980;4(4–5):507–18

The regional distribution of gamma 3–melanotropin–like peptides in bovine brain is correlated with adrenocorticotropin immunoreactivity but not with beta–endorphin. Shibasaki T, et al. **Regul Pept** 1981 Apr; 2(1):43–52

Differential immunostaining of adenohypophysial cells with antisera to ACTH and beta–endorphin. Watkins WB. **Regul Pept** 1981 Mar; 1(6):375–85

Selective protection of methionine enkephalin released from brain slices by enkephalinase inhibition. Patey G, et al. **Science** 1981 Jun 5; 212(4499):1153–5

[Possibility of the proline–rich exorphins biodegradation in the gastrointestinal tract (author's transl)] Křepela E. **Cesk Gastroenterol Vyz** 1981 Mar;35(2):68–71 (Eng. Abstr.) (Cze)

[Distribution of substance P and methionine enkephalin in dorsolateral pontine tegmentum of the cat. Immunofluorescence study] Charnay Y, et al. **C R Acad Sci [D] (Paris)** 1981 Feb 2;292(5):435–40 (Eng. Abstr.) (Fre)

[Endorphins: structure, roles and biogenesis] Chrétien M, et al. **Can J Physiol Pharmacol** 1981 May;59(5):413–31 (218 ref.) (Eng. Abstr.) (Fre)

[Neuroendocrinological aspects of endorphins] Herz A. **Verh Dtsch Ges Inn Med** 1980;86:4–12 (45 ref.) (Ger)

[Prolactin secretion inhibition as affected by leucine enkephalin] Iudaev NA, et al. **Dokl Akad Nauk SSSR** 1981;256(2):500–2 (Rus)

ENURESIS

Evaluation of various methods in treatment of enuresis. Mehrotra SN, et al. **Indian Pediatr** 1980 Jun;17(6):519–22

EPHEDRINE

A clinical trial of antihistamine, decongestant, or placebo in antibiotic–treated acute otitis media followed with pneumatic otoscopy and impedance tympanometry. Lampe RM, et al. **Milit Med** 1981 Apr;146(4):259–61

EPINEPHRINE

Effects of adrenergic neuron and ganglion blockers on hemodynamics and plasma catecholamine levels after corticosteroids during hemorrhagic shock in the dog. Haglund U, et al. **Acta Anaesthesiol Scand** 1980 Dec;24(6):444–50

Changes of receptor cooperation in Tetrahymena by re–exposure to hormones. Csaba G, et al. **Acta Biol Acad Sci Hung** 1980;31(1–3):43–7

Effect of epinephrine and 5–hydroxytryptamine on in vitro thyroid iodine organification. Masini–Repiso AM, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):207–12

Thyroid hormone–catecholamine interrelationships during exposure to cold. Storm H, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):91–7

Neuropathological findings in autonomic nervous system of alimentary tract of rat after application of catecholamines. Jędrzejewska A, et al. **Acta Neuropathol [Suppl] (Berl)** 1981;7:273–5

Urinary catecholamine excretion and plasma dopamine–beta–hydroxylase activity during mental work performed in some periods of menstrual cycle in women. Wasilewska E, et al. **Acta Physiol Pol** 1980;31(6):647–51

Catecholamines and monoamine oxidase activity in anxiety. Mathew RJ, et al. **Acta Psychiatr Scand** 1981 Mar;63(3):245–52

Dose–related interaction between timolol and adrenaline. Ohrström A. **Albrecht Von Graefes Arch Klin Exp Ophthalmol** 1981;216(1):55–9

Maternal psychological and physiologic correlates of fetal–newborn health status. Lederman E, et al. **Am J Obstet Gynecol** 1981 Apr 15;139(8):956–8

Effect of counterregulatory hormones on kinetic response to ingested glucose in dogs. Saccà L, et al. **Am J Physiol** 1981 May;240(5):E465–73

Contractility of vascular smooth muscle: maximum ability to contract in response to a stimulus. Skaug N, et al. **Am J Physiol** 1981 Jun;240(6):H971–9

A comparative study on the retention of 3H lignocaine and 3H prilocaine in the presence of various vasoconstrictors. Almasi W, et al. **Aust Dent J** 1980 Dec;25(6):316–8

Induction of phosphoenolpyruvate carboxykinase by sympathetic agents in primary cultures of adult rat hepatocytes. Wölfle D, et al. **Biochem Biophys Res Commun** 1981 Feb 27;98(4):1084–90

Use of a novel rapid preparation of fat–cell plasma membranes employing Percoll to investigate the effects of insulin and adrenaline on membrane protein phosphorylation within intact fat–cells. Belsham GJ, et al. **Biochem J** 1980 Nov 15;192(2):457–67

Phosphorylation of rabbit cardiac–muscle troponin I by phosphorylase kinase. The effect of adrenaline. Moir AJ, et al. **Biochem J** 1980 Nov 1;191(2):547–54

Plasma kallikrein–generating activity evoked by rat peritoneal–fluid mast cells following treatment with epinephrine, 8–bromo–cyclic 3',5'–guanosine monophosphate or compound 48/80. Rothschild AM. **Biochem Pharmacol** 1981 Mar 1;30(5):481–7

Catecholamines and the brain microsomal Na, K–adenosinetriphosphatase—I. Protection against lipoperoxidative damage. Svoboda P, et al. **Biochem Pharmacol** 1981 Mar 1;30(5):427–32

Reversible swelling evoked by epinephrine, 8–bromo–cyclic 3',5'–guanosine monophosphate and feeding in the mast cells of the rat. Tamburus EL, et al. **Biochem Pharmacol** 1981 Mar 1;30(5):469–79

The influence of adrenaline on the metabolism of erythrocytes in vitro. Mairbäurl H, et al. **Biochem Soc Trans** 1981 Feb;9(1):99–100

The influences of glucagon, epinephrine and alpha– and beta–adrenergic agents on glycogenolysis in isolated rabbit hepatocytes and perfused livers. Rufo GA Jr, et al. **Biochim Biophys Acta** 1981 May 18;674(3):297–305

Type of adrenoceptors involved in induction by adrenaline of hepatic alkaline phosphatase in mice in vivo. Mary PL, et al. **Br J Pharmacol** 1981 Jan;72(1):8–9

Post–biopsy haematuria successfully treated by selective transcatheter epinephrine injection. Vaeusorn N, et al. **Br J Radiol** 1981 May;54(641):425–6

Characteristics of the beta 1–and beta 2–adrenergic–sensitive adenylate cyclases in glial cell primary cultures and their comparison with beta 2–adrenergic–sensitive adenylate cyclase of meningeal cells. Ebersolt C, et al. **Brain Res** 1981 May 25;213(1):151–61

Electrophysiological characteristics of rodent myocardium damaged by adrenaline. Gilmour RF Jr, et al. **Cardiovasc Res** 1980 Oct;14(10):582–9

Effects of calcitonin and epinephrine on serum glucose concentration in rats. Yamaguchi M. **Chem Pharm Bull (Tokyo)** 1980 Dec;28(12):3693–5

The effect of epinephrine on blood and tissue PO2 in the rabbit. Towell ME, et al. **Circ Shock** 1981;8(2):123–30

A simple chromatographic technique for the estimation of urinery levels of normetadrenaline and metadrenaline. Hanson P, et al. **Clin Biochem** 1980 Dec;13(6):262–5

Analysis of urinary metanephrines by reversed–phase high–performance liquid chromatography and electrochemical detection. Bertani–Dziedzic LM, et al. **Clin Chim Acta** 1981 Feb 19;110(1):1–8

The effect of adrenaline on peripheral vascular resistance at different temperatures in a hind part preparation of rainbow trout (Salmo gairdnerii R.). Moen KA, et al. **Comp Biochem Physiol [C]** 1981;69C(1):157–9

Plasma norepinephrine, epinephrine, and dopamine concentrations in maternal and fetal sheep during spontaneous parturition and in premature sheep during cortisol–induced parturition. Eliot RJ, et al. **Endocrinology** 1981 May;108(5):1678–82

Morphine: dual effects on plasma catecholamines. Taborsky GJ Jr, et al. **Endocrinology** 1981 Jul;109(1):319–21

In vivo and in vitro effects of adrenaline on conversion of thyroxine to triiodothyronine and to reverse–triiodothyronine in dog liver and heart. Nauman A, et al. **Eur J Clin Invest** 1980 Jun;10(3):189–92

Acute sino–aortic denervation in rats produces a selective increase of adrenaline turnover in the dorsal midline area of the caudal medulla oblongata and a reduction of adrenaline levels in the anterior and posterior hypothalamus. Yukimura T, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):361–5

Degeneration of nerve terminals in cats following systemic epinephrine: depletion of tissue norepinephrine correlated with ultrastructural changes. Flach AJ, et al. **Exp Eye Res** 1981 Apr;32(4):389–94

The effect of hormones on the haemodynamics in animals of different age groups. Frolkis VV, et al. **Exp Gerontol** 1981;16(1):1–12

The effect of phenoxybenzamine on the relationship between glycerol release and cyclic AMP levels in the presence of insulin in epinephrine–stimulated rat adipocytes. Wong EH, et al. **FEBS Lett** 1981 May 18;127(2):217–20

Influence of the hypophysio–adrenocortical system on the metabolism of 3H–adrenaline in the hypothalamus, hypophysis and the rest of the brain of rats. Parvez H, et al. **Horm Metab Res** 1981 Feb;13(2):98–102

Utilization of epinephrine–containing anesthetic solutions in the toes. Roth RD. **J Am Podiatry Assoc** 1981 Apr;71(4):189–99

Amine transport in chromaffin granule ghosts. pH dependence implies cationic form is translocated. Knoth J, et al. **J Biol Chem** 1981 Jul 10;256(13):6541–3

Novel post–column derivatization method for the fluorimetric determination of norepinephrine and epinephrine. Nimura N, et al. **J Chromatogr** 1980 Dec 12;221(2):249–55

Epinephrine plasma thresholds for lipolytic effects in man: measurements of fatty acid transport with [l–13C]palmitic acid. Galster AD, et al. **J Clin Invest** 1981 Jun;67(6):1729–38

Essential role of GTP in epinephrine stimulation of human fat cell adenylate cyclase. Katz MS, et al. **J Lipid Res** 1981 Jan;22(1):113–21

Determination of catecholamine permeability coefficients for passive diffusion across phospholipid vesicle membranes. Bochain A, et al. **J Membr Biol** 1981;60(1):73–6

Biochemical and histochemical studies on catecholamines in bullfrog spinal ganglia. Kojima H, et al. **J Neurochem** 1981 Jun;36(6):2106–9

Role of adrenergic mechanism in ketogenesis. Takabayashi Y, et al. **Keio J Med** 1980 Apr;29(1):1–8

Thyrotropin releasing factor: a putative CNS regulator of the autonomic nervous system. Brown MR. **Life Sci** 1981 Apr 13–20;28(15–16):1789–95

Glucagon and epinephrine–stimulated phospholipid methylation in hepatic microsomes. Kraus–Friedmann N, et al. **Life Sci** 1981 Mar 30;28(13):1483–8

Epinephrine–independent production of hyperuricemia by means of hypothalamic stimulation in the conscious rat. Sumi T, et al. **Life Sci** 1981 Mar 9;28(10):1183–8

Effect of epinephrine and dibutyryl cyclic AMP on delta 5–desaturation activity of rat liver microsomes. de Gomez Dumm IN, et al. **Lipids** 1980 Dec;15(12):1064–6

Distinct regulations by calcium of cyclic GMP levels and catecholamine secretion in isolated bovine adrenal chromaffin cells. Lemaire S, et al. **Metabolism** 1981 May;30(5):462–8

Active transport of biogenic amines in chromaffin granule membrane vesicles. Schuldiner S, et al. **Monogr Neural Sci** 1980;7:117–28

Sustained potentiation of transmitter release by adrenaline and dibutyryl cyclic AMP in sympathetic ganglia. Kuba K. et al. **Nature** 1981 Jun 25;291(5817):654–6

Kinetic analyses of the mechanisms of action of inhibitors of the extraneuronal uptake of adrenaline in smooth muscle cells of guinea-pig trachea. Bryan LJ, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Jan;315(3):249–54

Comparison of brainstem and adrenal circadian patterns of epinephrine synthesis. Turner BB, et al. **Neuroendocrinology** 1981 May; 32(5):257–61

Effects of hypoxic and hormonal factors on ribonucleic acid content in spinal cord cells: comparison of the metabolic responses in neurons, perineuronal neuroglia and ependyma cells. Pevzner L. **Neuroscience** 1981;6(5):963–8

The effect of tryptolines (1, 2, 3, 4–tetrahydro–beta–carbolines) on monoamine metabolism and the platelet aggregation response in human platelets. Youdim MB, et al. **Neuroscience** 1981;6(4):801–10

Early effect of epinephrine on aqueous formation in the normal human eye. Nagataki S, et al. **Ophthalmology (Rochester)** 1981 Mar; 88(3):276–82

Emergence of beta–adrenergic sensitivity in the developing chicken heart. Lipshultz S, et al. **Proc Natl Acad Sci USA** 1981 Jan;78(1):288–92

Elevation of epinephrine concentration in rat brain by LY51641, a selective inhibitor of type A monoamine oxidase. Fuller RW, et al. **Res Commun Chem Pathol Pharmacol** 1981 May;32(2):207–21

In vitro response of the regenerating adrenal gland to epinephrine. Soliman KF, et al. **Res Commun Chem Pathol Pharmacol** 1981 May; 32(2):373–6

[Lactic acid in the blood of heifers after administration of adrenaline and its relationship to pregnancy] Hintnaus J. **Vet Med (Praha)** 1981 Feb; 26(2):95–100 (Eng. Abstr.) (Cze)

[Comparative pharmacology of adrenaline and noradrenaline] Martin C, et al. **Ann Anesthesiol Fr** 1981;22(1):85–96 (16 ref.) (Fre)

[Effect of adrenergic beta–receptor blockers on the oxygen consumption of narcotized rats and the calorigenic action of adrenaline] Ankermann H. **Acta Biol Med Ger** 1980;39(11–12):1227–34 (Eng. Abstr.) (Ger)

[Comparative pharmacological study of d,l–adrenaline dipivalate hydrochloride and l–adrenaline hydrochloride after local and oral administration] Eisenburger R, et al. **Arzneimittelforsch** 1981; 31(2):325–34 (Eng. Abstr.) (Ger)

[Effect of acetylcholine and adrenaline on membrane currents in ventricular muscle (author's transl)] Ochi R. **Kokyu To Junkan** 1980 Oct;28(10):1103–9 (Jpn)

[The hormonal regulation of the hepatic glycogenolysis in the newborn (author's transl)] Okazaki H. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 May;32(5):541–9 (Eng. Abstr.) (Jpn)

[Effect of adrenaline, noradrenaline and acetylcholine on rabbit and human uterine activity in vivo (author's transl)] Sakoda H. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 Jun;32(6):697–705 (Eng. Abstr.) (Jpn)

ESCAPE REACTION

Alterations in brain norepinephrine metabolism and behavior induced by environmental stimuli previously paired with inescapable shock. Cassens G, et al. **Behav Brain Res** 1981 May;2(3):387–407

Effects of chlorpromazine on escape and avoidance responses: a closer look. Spirduso WW, et al. **Pharmacol Biochem Behav** 1981 Apr, 14(4):433–8

ESTRADIOL

Direct evidence in men for a role of endogenous oestrogens on gonadotrophin release. D'Agata R, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):145–9

Estrogenic and antiestrogenic effects of danazol administration in studies of estradiol receptor binding. Musich JR, et al. **Am J Obstet Gynecol** 1981 May 1;140(1):62–9

Hormonal control of postnatal development of corticosteroid–binding globulin. D'Agostino J, et al. **Am J Physiol** 1981 Apr;240(4):E402–6

Sensitivity of rat adenohypophyseal cells to estradiol and LHRH during long–term culture. Lagacé L, et al. **Am J Physiol** 1981 Jun; 240(6):E602–8

LH responses to LHRH, DBcAMP, and 17 beta–estradiol in cultures derived from aged rats. Tang LK, et al. **Am J Physiol** 1981 May; 240(5):E510–8

Effects of bromocriptine on [3H]estradiol binding in cytosol of anterior pituitary. De Nicola AF, et al. **Endocrinology** 1981 Jul;109(1):83–6

Dissociated changes of pituitary luteinizing hormone–releasing hormone (LHRH) receptors and responsiveness to the neurohormone induced by 17 beta–estradiol and LHRH in vivo in the rat. Ferland L, et al. **Endocrinology** 1981 Jul;109(1):87–93

The actions of porcine follicular fluid and estradiol on periovulatory secretion of gonadotropic hormones in rats. Rush ME, et al. **Endocrinology** 1981 Jun;108(6):2316–23

Estradiol as a gonadotropin releasing hormone in the rhesus monkey. Wildt L, et al. **Endocrinology** 1981 May;108(5):2011–3

Effects of estradiol and progesterone on catecholamine turnover rates in discrete hypothalamic regions in ovariectomized rats. Wise PM, et al. **Endocrinology** 1981 Jun;108(6):2186–93

Maintenance by L–DOPA treatment of estrous cycles and LH response to estrogen in aging female rats. Forman LJ, et al. **Exp Aging Res** 1980 Dec;6(6):547–54

A biphasic effect of estradiol on serotonin metabolism in rat pineal organ cultures. Cardinali DP, et al. **Experientia** 1981 Feb 15;37(2):203–4

Correlation between plasma thyroxine levels and corticosterone–binding activity in intact, ovariectomized, and ovariectomized estrogen–treated rats. Calvano SE, et al. **Horm Metab Res** 1981 Mar;13(3):171–4

Relationship between thyrotropin, thyroid hormones, thyroxine–binding globulin and estradiol–17 beta levels in normal pregnancy. Sawhney RC, et al. **Indian J Med Res** 1981 Jan;73:41–52

Importance of the episodic nature of luteinizing hormone secretion for normal development of the bovine testis during puberty: interference with oestradiol–17 beta. Schanbacher BD. **J Endocrinol** 1981 Mar; 88(3):393–400

Effect of oestrogen and an LH–RH agonist on the release of gonadotrophins in ovariectomized ewes deprived of LH–RH. Fraser HM, et al. **J Reprod Fertil** 1981 May;62(1):131–40

Estrogen potentiates the stereotypy induced by dopamine agonists in the rat. Chiodo LA, et al. **Life Sci** 1981 Feb 16;28(7):827–35

A dopamine agonist stimulates progesterone secretion from adrenal gland. Kalra SP, et al. **Life Sci** 1981 Mar 30;28(13):1467–9

A group–comparative study of effects of Ovestin cream versus Premarin cream in post–menopausal women with vaginal atrophy. Luisi M, et al. **Maturitas** 1980 Dec;2(4):311–9

Effects of estrogens on the responses of caudate neurons to microiontophoretically applied dopamine. Arnauld E, et al. **Neurosci Lett** 1981 Feb 6;21(3):325–31

Contrasting effects of diethylstilbestrol and estradiol on contraction of isolated rat aorta. Roesch CB, et al. **Pharmacology** 1981;22(1):15–23

Growth hormone, insulin, prolactin and total thyroxine in the plasma of sheep implanted with the anabolic steroid trenbolone acetate alone or with oestradiol. Donaldson IA, et al. **Res Vet Sci** 1981 Jan; 30(1):7–13

LH and prolactin in estrogenized female rats: response to LHRH. Vaticón MD, et al. **Rev Esp Fisiol** 1980 Dec;36(4):371–6

[Induction of lactation in cattle after short–term hormonal treatment] Manunta G, et al. **Boll Soc Ital Biol Sper** 1981 Jan 30;57(2):172–8 (Eng. Abstr.) (Ita)

[Hormonal induction of lactation after short–term treatment in sheep. III.] Manunta G, et al. **Boll Soc Ital Biol Sper** 1981 Jan 30;57(2):165–71 (Eng. Abstr.) (Ita)

[Effects of hypothalamic deafferentation and estrogen on the distribution and content of hypothalamic LHRH (author's transl)] Taketani Y. **Acta Obstet Gynaecol Jpn** 1981 May;33(5):625–34 (Eng. Abstr.) (Jpn)

EXPLORATORY BEHAVIOR

Habituation of the head–poke response: effects of an amphetamine–barbiturate mixture, PLG and fenfluramine. Koek W, et al. **Psychopharmacology (Berlin)** 1981;72(3):251–6

[Locomotor activity of rats following chronic pretreatment with haloperidol] Oehler J, et al. **Acta Biol Med Ger** 1980; 39(11–12):1235–9 (Eng. Abstr.) (Ger)

[Diphasic action of apomorphine on motility of the rat. I. Dose–effect relationship in exploratory and basal motility] Vaccheri A, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):374–80 (Eng. Abstr.) (Ita)

EXTINCTION (PSYCHOLOGY)

The partial reinforcement extinction effect after treatment with chlordiazepoxide. Feldon J, et al. **Psychopharmacology (Berlin)** 1981; 73(3):269–75

FACTITIOUS DISORDERS

Pseudodementia and physical findings masking significant psychopathology. Good MI. **Am J Psychiatry** 1981 Jun;138(6):811–4

FEAR

Differential diagnosis and treatment of panic attacks and phobic states. Liebowitz MR, et al. **Annu Rev Med** 1981;32:583–99 (46 ref.)

FENFLURAMINE

The metabolism and kinetics of tiflorex in the rat. Mas–Chamberlin C, et al. **Drug Metab Dispos** 1981 Mar–Apr;9(2):150–5

Effect of fenfluramine and related compounds on the pancreatic colipase/lipase system. Borgström B, et al. **FEBS Lett** 1981 Apr 6; 126(1):25–8

Habituation of the head-poke response: effects of an amphetamine-barbiturate mixture, PLG and fenfluramine. Koek W, et al. **Psychopharmacology (Berlin)** 1981;72(3):251–6

[Ponderal Retard] de Longraye J. **Soins** 1981 Jan 20;26(2):45–6 (Fre)

FLICKER FUSION

Critical flicker fusion (CFF) test for sedative effect of antidepressants. Holmberg G. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):289–301

FLUPHENAZINE

Late (4–8 years) outcome of treatment with megadoses of fluphenazine enanthate in drug-refractory schizophrenics. Dencker SJ, et al. **Acta Psychiatr Scand** 1981 Jan;63(1):1–12

Depot fluphenazine maintenance treatment and associated weight changes. Marriott P, et al. **Compr Psychiatry** 1981 May–Jun;22(3):320–5

Treatment of fibromyositis with fluphenazine and amitriptyline: a preliminary report. Connolly RG. **Del Med J** 1981 Apr;53(4):189–91

Biochemical mechanism of tolerance to neuroleptic drugs; regional differences in rat brain. Bacopoulos NG. **Eur J Pharmacol** 1981 Apr 9;70(4):585–6

Prolonged dopamine receptor blockade in rats after termination of long-term depot fluphenazine [letter] Waddington JL, et al. **Lancet** 1981 Jun 20;1(8234):1375–6

Slow decline of plasma drug and prolactin levels after discontinuation of chronic treatment with depot neuroleptics [letter] Wistedt B, et al. **Lancet** 1981 May 23;1(8230):1163

Natural and therapeutic environmental indicators of maintenance dosage requirements [proceedings] Hogarty GE. **Psychopharmacol Bull** 1981 Jan;17(1):36–7

[The course of long-term care with fluphenazine decanoate (Dapotum D)] Deiser R, et al. **Psychiatr Clin (Basel)** 1980;13(3–4):193–205 (Eng. Abstr.) (Ger)

[Modification of schizophrenia by intensive neuroleptic therapy and the course of the disease after withdrawal of neuroleptic drugs] Steiner S. **Psychiatr Clin (Basel)** 1980;13(3–4):165–78 (Eng. Abstr.) (Ger)

[The influence of trihexyphenidyl on the antiamphetaminic action of fluphenazine (author's transl)] Kleinrok Z, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979;34:341–5 (Eng. Abstr.) (Pol)

[The influence of atropine on the antiamphetaminic action of fluphenazine (author's transl)] Rechberger T, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979;34:333–9 (Eng. Abstr.) (Pol)

FLURAZEPAM

Determination of flurazepam in human plasma by gas chromatography-electron capture negative chemical ionization mass spectrometry. Miwa BJ, et al. **Anal Chem** 1981 May;53(6):793–7

Tolerance during chronic benzodiazepine treatment associated with decreased receptor binding. Rosenberg HC, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):453–60

Rapid quantitation of flurazepam and its major metabolite, N-desalkylflurazepam, in human plasma by gas-liquid chromatography with electron-capture detection. Riva R, et al. **J Chromatogr** 1981 Mar 13;222(3):491–5

FOOD DEPRIVATION

Adrenergic neuroplasticity is maintained in the nutritional rehabilitated adult rat. Gottesfeld Z, et al. **Experientia** 1981 Feb 15;37(2):168–9

Intravenous self-administration of etonitazene, cocaine and phencyclidine in rats during food deprivation and satiation. Carroll ME, et al. **J Pharmacol Exp Ther** 1981 May;217(2):241–7

Pharmacokinetic study of apomorphine-induced stereotypy in food deprived rats. Watanabe H, et al. **Pharmacol Biochem Behav** 1981 Apr; 14(4):493–6

FSH

Direct evidence in men for a role of endogenous oestrogens on gonadotrophin release. D'Agata R, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):145–9

Release of LH and FSH by anterior pituitary cell suspensions from female rats during the estrous cycle and from estrogen-treated ovariectomized rats. Baldwin DM, et al. **Biol Reprod** 1981 Apr;24(3):581–90

Role of the ovary in controlling luteinizing hormone, follicle stimulating hormone, and prolactin secretion during and after lactation in pigs. Stevenson JS, et al. **Biol Reprod** 1981 Mar;24(2):341–53

Increased postovulatory plasma follicle stimulating hormone levels in the luteinized unruptured follicle syndrome: a role for inhibin? Koninckx PR, et al. **Br J Obstet Gynaecol** 1981 May;88(5):525–9

A radioimmunoassay for a highly active luteinizing hormone-releasing hormone analogue and relation between the serum level of the analogue and that of gonadotropin. Yamazaki I, et al. **Endocrinol Jpn** 1980 Oct; 27(5):593–605

Stimulation of beta 2-adrenergic responsiveness by follicle-stimulating hormone in rat granulosa cells in vitro and in vivo. Adashi EY, et al. **Endocrinology** 1981 Jun;108(6):2170–8

Regulation of the second surge of follicle-stimulating hormone; effects of antiluteinizing hormone-releasing hormone serum and pentobarbital. Hasegawa Y, et al. **Endocrinology** 1981 Jul;109(1):130–5

Catecholamine turnover rates in discrete hypothalamic areas and associated changes in median eminence luteinizing hormone-releasing hormone and serum gonadotropins on proestrus and diestrous day 1. Rance N, et al. **Endocrinology** 1981 May;108(5):1795–802

The actions of porcine follicular fluid and estradiol on periovulatory secretion of gonadotropic hormones in rats. Rush ME, et al. **Endocrinology** 1981 Jun;108(6):2316–23

In vivo effect of inhibin on FSH uptake by rat testis. Vanage GR, et al. **Experientia** 1981 Apr 15;37(4):433–4

Gonadotrophin release in vitro, in the presence and absence of luteinizing hormone releasing hormone, by pituitary glands from ovariectomized and sham-operated immature female rats of various ages. Dullaart J. **J Endocrinol** 1981 Mar;88(3):375–9

Pituitary function during pseudopregnancy and lactation in the rat. Taya K, et al. **J Reprod Fertil** 1981 May;62(1):93–8

Isolation and characterization of a bovine seminal plasma protein inhibiting pituitary FSH secretion. Sairam MR, et al. **Mol Cell Endocrinol** 1981 May;22(2):231–50

[The intragonadic cybernins (author's transl)] Franchimont P. **J Gynecol Obstet Biol Reprod (Paris)** 1980;9(8):825–34 (Eng. Abstr.) (Fre)

[Orientation studies of ovulation release in mice to test gonadotropic preparations. 2. FSH, PMSG and Gn-RH activity] Bergfeld J, et al. **Arch Exp Veterinaermed** 1981;35(1):143–8 (Eng. Abstr.) (Ger)

GABA

The concentration of gamma-aminobutyric acid (GABA) in discrete areas of rat brain after chemical sympathectomy or serotoninectomy. Szkilnik R, et al. **Acta Physiol Pol** 1980;31(5):513–5

GABAergic mechanisms in blood pressure control. A pharmacological analysis in the rat. Persson B. **Acta Physiol Scand [Suppl]** 1980; 491:1–54

Inhibition of GABA metabolism in rat brain slices by halothane. Cheng SC, et al. **Anesthesiology** 1981 Jul;55(1):26–33

Isolation and identification of gamma-aminobutyric acid in Streptomyces lincolnensis. Haak WJ, et al. **Antimicrob Agents Chemother** 1981 Mar; 19(3):493

Glutamate, aspartate, and gamma-aminobutyrate transport by membrane vesicles prepared from rat brain. Roskoski R Jr, et al. **Arch Biochem Biophys** 1981 Apr 1;207(2):407–15

Absorption of 14C-clanobutin-Na in blood-perfused tied-off jejunal segments in vivo of rats. Overhoff H, et al. **Arzneimittelforsch** 1981; 31(4):670–4

Absorption of 14C-clanobutin-Na isolated perfused intestinal segments in vitro of rats. Strugala G, et al. **Arzneimittelforsch** 1981; 31(3):429–33

Studies on bicuculline binding sites on neuronal membrane using fluorescent antibody technique: comparative binding of GABA and bicuculline. Bhattacharyya A, et al. **Biochem Biophys Res Commun** 1981 Jan 30;98(2):520–6

Competitive inhibition by 3-aminopropanesulfonic acid and gamma-aminobutyric acid of carnitine transport in rat brain slices. Fariello RG, et al. **Biochem Pharmacol** 1981 May 1;30(9):1012–3

The enzymes catalysing succinic semialdehyde reduction in rat brain. Rivett AJ, et al. **Biochem Pharmacol** 1981 Apr 1;30(7):741–7

Determination of glutamic acid and gamma-aminobutyric acid in Ringer's solution without desalination at the femtomole level by gas chromatography chemical ionization mass spectrometry. Murayama K, et al. **Biomed Mass Spectrom** 1981 Apr;8(4):165–9

SL 75 102 as a gama-aminobutyric acid agonist: experiments on dorsal root ganglion neurones in vitro. Desarmenien M, et al. **Br J Pharmacol** 1981 Feb;72(2):355–64

Sensitivity of identified medial hypothalamic neurons to GABA, glycine and related amino acids; influence of bicuculline, picrotoxin and strychnine on synaptic inhibition. Blume HW, et al. **Brain Res** 1981 Mar 23;209(1):145–58

Changes of electroretinogram and neurochemical aspects of GABAergic neurons of retina after intraocular injection of kainic acid in rats. Goto M, et al. **Brain Res** 1981 May 4;211(2):305–14

Benzodiazepines prevent kainate-induced loss of GABAergic and cholinergic neurons in the chick retina. Imperato A, et al. **Brain Res** 1981 May 25;213(1):205–10

Sensitivity to GABA of neurons of the dorsal and ventral lateral geniculate nuclei in the rat. Kayama Y, et al. **Brain Res** 1981 Apr 27; 211(1):202–5

Effects of halopemide on GABA receptor binding, uptake and release. Loonen AJ, et al. **Brain Res** 1981 Apr 6;210(1–2):485–92

The role of GABA in the regulation of the dopamine/tyrosine hydroxylase-containing neurons of the rat retina. Marshburn PB, et al. **Brain Res** 1981 Jun 15;214(2):335–47

Inhibitory actions of taurocyamine, hypotaurine, homotaurine, taurine and GABA on spike discharges of Purkinje cells, and localization of sensitive sites, in guinea pig cerebellar slices. Okamoto K, et al. **Brain Res** 1981 Feb 16;206(2):371–86

Potassium-stimulated, calcium-dependent release of [3H]GABA from neuron- and glia-enriched cultures of cells dissociated from rat cerebellum. Pearce BR, et al. **Brain Res** 1981 Feb 16;206(2):485–9

Barbiturate enhancement of GABA-mediated inhibition and activation of chloride ion conductance: correlation with anticonvulsant and anesthetic actions. Schulz DW, et al. **Brain Res** 1981 Mar 23; 209(1):177–88

The insensitivity of developing benzodiazepine receptors to chronic treatment with diazepam, GABA and muscimol in brain cell cultures. Shibla DB, et al. **Brain Res** 1981 Apr 6;210(1–2):471–4

Growth dependent induction of high affinity gamma-amino-butyric acid transport in cultures of a normal human brain cell line. Walum E, et al. **Brain Res** 1981 May 11;212(1):215–8

Effect of GABA agonist and antagonists on cardiovascular and sympathetic responses in SHR and WKY rats. Feuerstein G, et al. **Clin Exp Hypertens** 1981;3(2):207–18

Succinic semialdehyde dehydrogenases of Escherichia coli: their role in the degradation of p-hydroxyphenylacetate and gamma-aminobutyrate. Donnelly MI, et al. **Eur J Biochem** 1981 Jan;113(3):555–61

gamma-Aminobutyric acid regulation of the benzodiazepine receptor: biochemical evidence for pharmacologically different effects of benzodiazepines and propyl beta-carboline-3-carboxylate. Ehlert FJ, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):593–5

GABA enhancement of [3H]dopamine release from slices of rat striatum: dependence on slice size. Ennis C, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):417–20

GABA antagonists enhance dopamine turnover in the rat retina in vivo. Kamp CW, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):273–9

Molecular sizes of benzodiazepine receptors and the interacting GABA receptors in the membrane are identical. Chang LR, et al. **FEBS Lett** 1981 Apr 20;126(2):309–12

Golgi-impregnated amacrine cells and GABAergic retinal neurons: a comparison of dendritic, immunocytochemical and histochemical stratification in the inner plexiform layer of rat retina. Famiglietti EV Jr, et al. **J Comp Neurol** 1981 Mar 20;197(1):129–39

GABAergic amacrine cells in rat retina: immunocytochemical identification and synaptic connectivity. Vaughn JE, et al. **J Comp Neurol** 1981 Mar 20;197(1):113–27

The release of gamma-aminobutyric acid, glutamate, and acetylcholine from striatal slices: a mass fragmentographic study. Moroni F, et al. **J Neurochem** 1981 May;36(5):1691–9

GABA conductance of chick spinal cord and dorsal root ganglion neurons in cell culture. Choi DW, et al. **J Neurophysiol** 1981 Apr; 45(4):605–20

Chlordiazepoxide selectively potentiates GABA conductance of spinal cord and sensory neurons in cell culture. Choi DW, et al. **J Neurophysiol** 1981 Apr;45(4):621–31

GABA-mediated synaptic potentials in chick spinal cord and sensory neurons. Choi DW, et al. **J Neurophysiol** 1981 Apr;45(4):632–43

Physiological and pharmacological basis of GABA and glycine action on neurons of mudpuppy retina. III. Amacrine-mediated inhibitory influences on ganglion cell receptive-field organization: a model. Frumkes TE, et al. **J Neurophysiol** 1981 Apr;45(4):783–804

Physiological and pharmacological basis of GABA and glycine action on neurons of mudpuppy retina. I. Receptors, horizontal cells, bipolars, and G-cells. Miller RF, et al. **J Neurophysiol** 1981 Apr;45(4):743–63

Physiological and pharmacological basis of GABA and glycine action on neurons of mudpuppy retina. II. Amacrine and ganglion cells. Miller RF, et al. **J Neurophysiol** 1981 Apr;45(4):764–82

A simple perfusion chamber for studying neurotransmitter release from cells maintained in monolayer culture. Pearce BR, et al. **J Neurosci Methods** 1981 Feb;3(3):255–9

Sodium valproate enhancement of gamma-aminobutyric acid (GABA) inhibition: electrophysiological evidence for anticonvulsant activity. Balding F Jr, et al. **J Pharmacol Exp Ther** 1981 May;217(2):445–50

Modulation by picrotoxin and IPTBO of 3H-flunitrazepam binding to the GABA/benzodiazepine receptor complex of rat cerebellum. Karobath M, et al. **Life Sci** 1981 Jan 19;28(3):307–13

Cerebellar specific gamma-glutamyltranspeptidase activation by GABA and taurine in postnatal mouse brain. Lisy V, et al. **Life Sci** 1980 Dec 22–29;27(25–26):2615–20

Present status and significance of the glutamine cycle in neural tissues. Shank RP, et al. **Life Sci** 1981 Feb 23;28(8):837–42 (36 ref.)

Cortical effects of monocular deprivation: suppression or deafferentation? [news] Movshon JA. **Nature** 1981 May 28;291(5813):284–5

The role of GABAergic inhibition in the cortical effects of monocular deprivation. Sillito AM, et al. **Nature** 1981 May 28;291(5813):318–20

GABA facilitation by noradrenaline shows supersensitivity in cerebellum after 6-hydroxydopamine. Moises HC, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980;315(1):37–46

Levels of glutamate, aspartate, GABA, and taurine in different regions of the cerebellum after x-irradiation-induced neuronal loss. Rea MA, et al. **Neurochem Res** 1981 Jan;6(1):33–9

GABA and muscimol inhibit the release of prolactin from dispersed rat anterior pituitary cells. Grossman A, et al. **Neuroendocrinology** 1981 Mar;32(3):145–9

Effects of anticonvulsants on excitability and GABA sensitivity of cat dorsal root ganglion cells. Gallagher JP, et al. **Neuropharmacology** 1981 May;20(5):427–33

Injections of dopaminergic, cholinergic, serotoninergic and GABAergic drugs into the nucleus accumbens: effects on locomotor activity in the rat. Jones DL, et al. **Neuropharmacology** 1981 Jan;20(1):29–37

An electrophysiological model of GABA-mediated neurotransmission. Matthews WD, et al. **Neuropharmacology** 1981 Jun;20(6):561–5

Modulatory interactions between norepinephrine and taurine, beta-alanine, gamma-aminobutyric acid and muscimol, applied iontophoretically to cerebellar Purkinje cells. Yeh HH, et al. **Neuropharmacology** 1981 Jun;20(6):549–60

Biphasic response of hippocampal pyramidal neurons to GABA. Thalmann RH, et al. **Neurosci Lett** 1981 Feb 6;21(3):319–24

Pentobarbitone slows the dissociation of GABA from rat brain synaptosomal binding sites. Willow M, et al. **Neurosci Lett** 1981 Apr 9;23(1):71–4

[3H]gamma-aminobutyrate autoradiography of the rat olfactory bulb: hypothetical grain analysis of the distribution of silver grains. Halász N, et al. **Neuroscience** 1981;6(3):473–9

Demonstration of central gamma-aminobutyrate-containing nerve terminals by means of antibodies against glutamate decarboxylase. Pérez de la Mora M, et al. **Neuroscience** 1981;6(5):875–95

Involvement of the GABAergic system on shock-induced aggressive behavior in two strains of mice. Puglisi-Allegra S, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:13–8

gamma-Aminobutyric acid and benzodiazepine receptors: copurification and characterization. Gavish M, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1939–42

Autoradiographic localization of benzodiazepine receptors in immunocytochemically identified gamma-aminobutyrergic synapses. Möhler H, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1935–8

Net uptake of gamma-aminobutyric acid by a high-affinity system of rat brain synaptosomes. Pastuszko A, et al. **Proc Natl Acad Sci USA** 1981 Feb;78(2):1242–4

Preliminary studies on CSF gamma-aminobutyric acid levels in psychiatric patients before and during treatment with different psychotropic drugs. Zimmer R, et al. **Prog Neuropsychopharmacol** 1980; 4(6):613–20

GABA depletion in chick brain-stem after intraventricular injection of cefazolin. Ientile R, et al. **Res Commun Chem Pathol Pharmacol** 1981 Feb;31(2):241–50

Stability of gamma-aminobutyric acid in human cerebrospinal fluid and plasma [letter] Löscher W, et al. **Ther Drug Monit** 1981;3(1):109

[Possible ways for the directed regulation of cerebral gamma aminobutyric acid (GABA) metabolism in local irradiation of the head (author's transl)] Savickij IV, et al. **Radiobiol Radiother (Berl)** 1980; 21(6):800–8 (Eng. Abstr.) (Ger)

[Role of the GABA-ergic link in the development of the tranquilizing effect in cats] Kozlovskaia MM, et al. **Biull Eksp Biol Med** 1981; 91(1):45–8 (Eng. Abstr.) (Rus)

[Effect of certain pharamcologic preparations and different lighting setups on human work capacity] Bogatova RI, et al. **Kosm Biol Aviakosm Med** 1981 Jan–Feb;15(1):92–3 (Rus)

[Activation of the cerebral GABA-ergic inhibiting system in stress] Pavlova VI, et al. **Patol Fiziol Eksp Ter** 1981 Jan–Feb;(1):26–30 (Eng. Abstr.) (Rus)

GALVANIC SKIN RESPONSE

The replicability of the psychophysiological effects of diazepam. Itil TM, et al. **Biol Psychiatry** 1981 Jan;16(1):65–70

Bilateral skin conductance and the pupillary light-dark reflex: manipulation by chlorpromazine, haloperidol, scopolamine, and placebo. Patterson T, et al. **Psychopharmacology (Berlin)** 1981;73(1):63–9

GLUCURONIDASE

Release of lysosomal hydrolases from bone explants affected by dental plaque. Tenovuo J, et al. **Acta Odontol Scand** 1980;38(6):355–61

The synthesis and processing of beta-glucuronidase in normal and egasyn deficient mouse kidney. Brown JA, et al. **Biochem Biophys Res Commun** 1981 Mar 31;99(2):691–9

Enzyme release and morphological changes in leukocytes induced by mechanical trauma. Dewitz TS, et al. **Blood Cells** 1979 Aug; 5(3):499–512

Inhibition by zinc of hepatic lysosomal release of beta-glucuronidase induced by phorbol-12-myristate-13-acetate (PMA). Pfeiffer CJ, et al. **Cancer Lett** 1980 Jul;10(1):51–6

Enzymatic and functional heterogeneity of lysosomes. Groh V, et al. **Cell Tissue Res** 1981;214(3):613–21

Triplex gene dosage effect of beta-glucuronidase and possible assignment to band q22 in a partial duplication 7q. Danesino C, et al. **Hum Genet** 1981;56(3):371–3

Effects of low doses of alpha-chlorohydrin on phosphatases, beta-glucosidase, beta-glucuronidase & hyaluronidase of rat testis & epididymis. Gill SK, et al. **Indian J Exp Biol** 1980 Nov; 18(11):1351–2

Hydrolysis of natural and synthetic substrates by alpha-L-fucosidase, beta-D-glucuronidase and beta-N-acetylhexosaminidase purified from molluscs. Cabezas JA, et al. **Int J Biochem** 1981;13(3):389–93

Comparative studies on postnatal development of liver beta-glucuronidase activity between Gunn rats and Wistar rats. Tamura S, et al. **J Toxicol Sci** 1980 Nov;5(4):331–8

[A cytochemical study of T, active T, non active T and B lymphocytes in respect to acid phosphatase and beta-glucuronidase activity (author's transl)] Takada K, et al. **Rinsho Byori** 1981 Feb;29(2):183–6 **(Jpn)**

GONADOTROPINS, PITUITARY

Ultrastructural localization of gonadotropin and luteinizing hormone releasing hormone in the pituitary gland of a teleost fish (the platyfish). Margolis-Kazan H, et al. **J Exp Zool** 1981 Jan;215(1):99–102

Effect of oestrogen and an LH-RH agonist on the release of gonadotrophins in ovariectomized ewes deprived of LH-RH. Fraser HM, et al. **J Reprod Fertil** 1981 May;62(1):131–40

Serotonin involvement in the regulation of gonadotropin secretion during lactation in the rat. Coppings RJ, et al. **Proc Soc Exp Biol Med** 1981 Apr;166(4):536–41

Chronic effects of the stimulatory luteinizing hormone-releasing hormone analogue D-Ser (TBU) 6-EA 10-LRH on the gonadotrophin and gonadal steroid secretion in women with amenorrhoea. Skarin G, et al. **Ups J Med Sci** 1980;85(2):103–12

[Testicular atrophy and gonadotropin activity in rats with portacaval anastomosis] Di Marcotullio A, et al. **Minerva Chir** 1980 Oct 15; 35(19):1449–54 (Eng. Abstr.) **(Ita)**

GUANETHIDINE

Autoradiographic assessment of 3H-proline uptake by osteoblasts following guanethidine-induced sympathectomy in the rat. Singh IJ, et al. **Cell Tissue Res** 1981;216(1):215–20

Intravascular guanethidine in the treatment of extravasated vasopressin [letter] Crocker MC. **N Engl J Med** 1981 Jun 4;304(23):1430

Reversal of guanethidine- and diethyldithiocarbamate-induced amnesia by peripherally-administered catecholamines. Walsh TJ, et al. **Pharmacol Biochem Behav** 1981 May;14(5):713–8

HABITUATION (PSYCHOPHYSIOLOGY)

Neuroendocrine changes following habituation of animal hypnosis in male rabbits. Farabollini F, et al. **Behav Brain Res** 1981 May;2(3):363–72

HALOPERIDOL

Haloperidol and droperidol treatment in schizophrenics. Clinical application of the 'prolactin-model'. Langer G, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):574–83

Neuroleptic-induced decrease in platelet MAO activity of schizophrenic patients. Chojnacki M, et al. **Am J Psychiatry** 1981 Jun; 138(6):838–40

Behavioral supersensitivity to methamphetamine following chronic treatment with (—)-sulpiride in the rat. Montanaro N, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):401–6

3H and 125I radioimmunoassays of haloperidol compared with fluoroimmunoassay involving antibody coupled to magnetizable solid phase. Rowell FJ, et al. **Clin Chem** 1981 Jul;27(7):1249–54

Time course of chronic haloperidol and clozapine upon operant rate and duration. Faustman W, et al. **Eur J Pharmacol** 1981 Mar 5; 70(1):65–70

A comparison of dopamine receptor blocking assay with plasma drug levels of haloperidol in schizophrenic patients. Kurland AA, et al. **J Clin Pharmacol** 1981 Jan;21(1):42–7

A comparative study of parenteral molindone and haloperidol in the acutely psychotic patient. Binder R, et al. **J Clin Psychiatry** 1981 May; 42(5):203–6

A new radioimmunoassay for haloperidol: direct measurement of serum and striatal concentrations. Wurzburger RJ, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):757–63

Chlorpromazine-induced decrease of red cell aggregability. Costa D, et al. **Med Interne** 1981 Jan–Mar;19(1):83–7

Blink rates and receptor supersensitivity. Karson CN, et al. **Neuropharmacology** 1981 Jan;20(1):91–3

Influence of substance P on the behavioral changes induced by haloperidol in rats. Jolicoeur FB, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):103–7

Disruption of autoshaped responding to a single of brain-stimulation reward by neuroleptic drugs. Phillips AG, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):543–8

An analysis of visual object reversal learning in the marmoset after amphetamine and haloperidol. Ridley RM, et al. **Pharmacol Biochem Behav** 1981 Mar;14(3):345–51

Differential prolactin responses to haloperidol and TRH in normal adult men. Hays SE, et al. **Psychoneuroendocrinology** 1981;6(1):45–52

Effects of lithium carbonate and haloperidol on cognition in aggressive, hospitalized school age children [proceedings] Platt JE, et al. **Psychopharmacol Bull** 1981 Jan;17(1):123–5

Effects of single and long-term haloperidol administration on open field behavior of rats. Bernardi MM, et al. **Psychopharmacology (Berlin)** 1981; 73(2):171–5

Increased mesolimbic dopamine binding following chronic haloperidol treatment. Kamer RS, et al. **Psychopharmacology (Berlin)** 1981; 72(3):261–3

Bilateral skin conductance and the pupillary light-dark reflex: manipulation by chlorpromazine, haloperidol, scopolamine, and placebo. Patterson T, et al. **Psychopharmacology (Berlin)** 1981;73(1):63–9

Serum and CSF levels of haloperidol by radioimmunoassay and radioreceptor assay during high-dose therapy of resistant schizophrenic patients. Rimón R, et al. **Psychopharmacology (Berlin)** 1981; 73(2):197–9

[Locomotor activity of rats following chronic pretreatment with haloperidol] Oehler J, et al. **Acta Biol Med Ger** 1980; 39(11–12):1235–9 (Eng. Abstr.) **(Ger)**

[Influence of the central dopaminergic system on GABAergic activity of the cerebellum. Initial results] Di Giorgio RM, et al. **Acta Neurol (Napoli)** 1981 Feb;36(1):302–4 (Eng. Abstr.) **(Ita)**

HEXOBARBITAL

Effect of cannabidiol on cytochrome P-450 and hexobarbital sleep time. Bornheim LM, et al. **Biochem Pharmacol** 1981 Mar 1;30(5):503–7

Stereoselective formation of glucuronides in metabolism of hexobarbital enantiomers in vivo: isolation and quantitation of glucuronides in rabbit urine. Miyano K, et al. **Drug Metab Dispos** 1981 Jan–Feb;9(1):60–4

Enhancement of hexobarbital-induced sleep by lysine and its metabolites. Chang YF, et al. **Life Sci** 1981 Jan 26;28(4):407–13

HISTAMINE

Additional data on the function of hypothalamic histamine. Huszti Z. **Agents Actions** 1981 Apr;11(1–2):135–42

Radical formation in single crystals of aromatic amines and radical transformation by light. Karsten W, et al. **Int J Radiat Biol** 1981 Mar; 39(3):235–52

The effect of histamine and H1 and H2 receptors on prolactin and luteinizing hormone release in humans: sex differences and the role of stress. Pontiroli AE, et al. **J Clin Endocrinol Metab** 1981 May; 52(5):924–8

Effect of diazepam on stress induced changes in brain histamine. Mazurkiewicz-Kwilecki IM. **Pharmacol Biochem Behav** 1981 Mar; 14(3):333–8

Histamine release and endothelial leakage from an intravascular contrast medium. Raininko R. **ROEFO** 1981 Apr;134(4):445–9

Histamine reactions due to ingestion of tuna fish (Thunnus argentivittatus) in patients on anti-tuberculosis therapy. Senanayake N, et al. **Toxicon** 1981;19(1):184–5

[Histamine and serotonin study in 1 blood sample] Proshina LIa. **Lab Delo** 1981;(2):90–3 (Eng. Abstr.) **(Rus)**

[Histamine and serotonin content in immunocompetent tissues and blood in vagotomized rats] Aksenova VM. **Patol Fiziol Eksp Ter** 1981 Jan–Feb;(1):23–6 (Eng. Abstr.) **(Rus)**

HISTRIONIC PERSONALITY DISORDER

Interrelationship of hysteroid dysphoria and borderline personality disorder. Liebowitz MR, et al. **Psychiatr Clin North Am** 1981 Apr; 4(1):67–87

HYDANTOINS

An improved procedure for high-sensitivity microsequencing: use of aminoethyl aminopropyl glass beads in the Beckman sequencer and the ultrasphere ODS column for PTH amino acid identification. Bhown AS, et al. **Anal Biochem** 1981 Jan 15;110(2):355–9

Rapid separation of amino acid phenylthiohydantoins by isocratic high-performance liquid chromatography. Tarr GE. **Anal Biochem** 1981 Feb;111(1):27–32

PMR and 13C-NMR spectroscopy of tropane and N-substituted nortropane spirohydantoins. Trigo GG, et al. **J Pharm Sci** 1981 Jan; 70(1):87–9

Behavioural, ECoG spectrum power and body temperature effects of BW 245C, a prostaglandin analogue after intraventricular microinjection in chicks. Rotiroti D, et al. **Neuropharmacology** 1981 May;20(5):517–20

[Establishment of the maximum permissible concentration of 5,5-dimethylhydantoin in reservoir water] Pis'ko GT, et al. **Gig Sanit** 1981 May;(5):69–70 **(Rus)**

HYDRAZINES

Development of occupational and environmental health criteria for the F–16. McLendon MH. **Aviat Space Environ Med** 1981 Mar; 52(3):145–7

A comparison of the effects of hydrallazine, diazoxide, sodium nitrite and sodium nitroprusside on human isolated arteries and veins. Moulds RF, et al. **Br J Clin Pharmacol** 1981 Jan;11(1):57–61

Differential effect of benserazide (Ro4–4602) on the concentration of indoleamines in rat pineal and hypothalamus. Arendt J, et al. **Br J Pharmacol** 1981 Feb;72(2):257–62

Deacylation of polymyxin B by hydrazine & solvolysis. Srinivasa BR, et al. **Indian J Biochem Biophys** 1980 Aug;17(4):298–302

The oxidation of hydrazine derivatives catalyzed by the purified liver microsomal FAD–containing monooxygenase. Prough RA, et al. **J Biol Chem** 1981 May 10;256(9):4178–84

Hydrazine formation from iproniazid. Hsu KY, et al. **J Pharmacobiodyn** 1980 Nov;3(11):620–7

The interaction of 2,3,4–trihydroxybenzylhydrazine with DOPA decarboxylase from pig kidney. Borri Voltattorni C, et al. **Life Sci** 1981 Jan 5;28(1):103–8

Cyclic hydrazides are mutagenic for Salmonella typhimurium. Zeiger E, et al. **Mutat Res** 1981 May;91(3):199–205

HYDRAZONES

Mechanism of action of antiviral hetarylhydrazones in vitro. Tonew M. **Acta Virol (Praha)** 1981 Mar;25(2):108–14

A novel preparation of human platelet lipoxygenase. Characteristics and inhibition by a variety of phenyl hydrazones and comparisons with other lipoxygenases. Wallach DP, et al. **Biochim Biophys Acta** 1981 Feb 23; 663(2):361–72

HYDROXYBUTYRATES

Changes in blood ketone body ratio: their significance after major hepatic resection. Ukikusa M, et al. **Arch Surg** 1981 Jun;116(6):781–5

Effect of pH and 3–hydroxybutyrate on insulin binding and action in cultured human fibroblasts. Hidaka H, et al. **Diabetes** 1981 May; 30(5):402–6

Kinetics of coupled gamma–hydroxybutyrate oxidation and D–glucuronate reduction by an NADP+–dependent oxidoreductase. Kaufman EE, et al. **J Biol Chem** 1981 Jul 10;256(13):6890–4

[Value of sodium gamma hydroxybutyrate in cerebral protection during severe hypoxia in the rat] Laborit G, et al. **Agressologie** 1980; 21(4):189–97 (Eng. Abstr.) **(Fre)**

[Lipids of the luminescent bacteria Photobacterium mandapamensis] Kalacheva GS, et al. **Mikrobiologiia** 1981 Jan–Feb;50(1):79–83 (Eng. Abstr.) **(Rus)**

HYDROXYDOPAMINE

Cardiac catecholamine stores after cardiac sympathectomy, 6–OHDA, and cardiac denervation. Priola DV, et al. **Am J Physiol** 1981 Jun; 240(6):H889–95

Effects of pre– and postnatal treatment with 6–hydroxydopamine on the development of the rat locus coeruleus. Sievers J, et al. **Bibl Anat** 1981; (19):258–63

Bradycardia following injection of 6–hydroxydopamine into the intermediate portion of nucleus tractus solitarius medialis. Healy DP, et al. **Brain Res** 1981 Feb 16;206(2):415–20

The relationship between loss of dopamine nerve terminals, striatal [3H]spiroperidol binding and rotational behavior in unilaterally 6–hydroxydopamine–lesioned rats. Heikkila RE, et al. **Brain Res** 1981 May 4;211(2):285–92

Destruction of noradrenergic cell bodies by intracerebral 6–hydroxydopamine in the newborn rat. Lanfumey L, et al. **Brain Res** 1981 Jun 15;214(2):445–50

Effects of denervation and 6–hydroxydopamine on the activity of choline acetyltransferase in the spleen of the cod, Gadus morhua. Winberg M, et al. **Comp Biochem Physiol [C]** 1981;69C(1):141–3

Neonatal intraspinal 6–hydroxydopamine: depletion of norepinephrine but not dopamine. Ings R, et al. **Eur J Pharmacol** 1981 Apr 9; 70(4):577–83

Differential effects of maternal and sibling presence of hyperactivity of 6–hydroxydopamine–treated developing rats. Teicher MH, et al. **J Comp Physiol Psychol** 1981 Feb;95(1):134–45

The role of nigral projections to the thalamus in drug–induced circling behaviour in the rat. Reavill C, et al. **Life Sci** 1981 Mar 30; 28(13):1457–66

GABA facilitation by noradrenaline shows supersensitivity in cerebellum after 6–hydroxydopamine. Moises HC, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980;315(1):37–46

Adrenalectomy and chemical sympathectomy by 6–hydroxydopamine. Effects on basal and stimulated insulin secretion. Ahrén B, et al. **Pfluegers Arch** 1981 Apr;390(1):17–21

6–hydroxydopamine and aggression in cats. Beleslin DB, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:29–32

Effect of morphine on circling behaviour in rats with 6–hydroxydopamine striatal lesions and electrolesions of the raphe nucleus. Slater P. **Pharmacol Biochem Behav** 1981 May;14(5):625–30

Effects of neonatal 6–hydroxydopamine treatment on catecholamine levels and behavior during development and adulthood. Fobes JL, et al. **Psychopharmacology (Berlin)** 1981;73(1):27–30

Use of 6–hydroxydopamine to deplete brain catecholamines in the rhesus monkey: effects on urinary catecholamine metabolites and behavior. Kraemer GW, et al. **Psychopharmacology (Berlin)** 1981;73(1):1–11

Catecholamine–serotonin interaction effects on activity in rats neonatally treated with 6–hydroxydopamine. Olds ME, et al. **Psychopharmacology (Berlin)** 1981;73(1):31–3

[Influence of the central dopaminergic system on GABAergic activity of the cerebellum. Initial results] Di Giorgio RM, et al. **Acta Neurol (Napoli)** 1981 Feb;36(1):302–4 (Eng. Abstr.) **(Ita)**

HYDROXYINDOLEACETIC ACID

Serotonin and noradrenaline uptake inhibitors in the treatment of depression—relationship to 5–HIAA in spinal fluid. Träskman–Bendz L, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):209–18

Monoamine metabolites in CSF and suicidal behavior. Träskman L, et al. **Arch Gen Psychiatry** 1981 Jun;38(6):631–6

Correlation of individual symptoms and other clinical variables with cerebrospinal fluid amine metabolites and tryptophan in depression. Banki CM, et al. **Arch Psychiatr Nervenkr** 1981;229(4):345–53

Simultaneous determination of femtomole quantities of 5–hydroxytryptophan, serotonin and 5–hydroxyindoleacetic acid in brain using HPLC with electrochemical detection. Lacković Z, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):347–52

Levels of HIAA and VMA in C.S.F. of schizophrenics before and after treatment. Okasha A, et al. **J Egypt Med Assoc** 1978; 61(Suppl 1–2):38–50

The effect of morphine on the content of serotonin, 5–hydroxyindole acetic acid and substance–P in the nuclei raphe magnus and reticularis gigantocellularis. Lakoski JM, et al. **Life Sci** 1980 Dec 22–29; 27(25–26):2639–44

Differential effects of short and long term lithium on tryptophan uptake and serotonergic function in cat brain. Swann AC, et al. **Life Sci** 1981 Jan 26;28(4):347–54

Brain serotonin and 5–hydroxyindoleacetic acid concentrations and serotonin synthesis following tetrahydro–beta–carboline administration in mice. Buckholtz NS. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):215–21

Involvement of serotonin and catecholamine metabolism in cats trained to perform a delayed response task. Vachon L, et al. **Neuroscience** 1981; 6(2):189–94

Platelet MAO activity and monoamine metabolites in cerebrospinal fluid in depressed and suicidal patients and in healthy controls. Oreland L, et al. **Psychiatry Res** 1981 Feb;4(1):21–9

Pretreatment amine neurotransmitter system interrelationships in depression [proceedings] Bowden CL, et al. **Psychopharmacol Bull** 1981 Jan;17(1):70–2

Cerebrospinal fluid amine metabolites and cyclic nucleotides in human aggression [proceedings] Brown GL, et al. **Psychopharmacol Bull** 1981 Jan;17(1):63–5

Unexpected neuroendocrine–transmitter relationships [proceedings] Stokes PE, et al. **Psychopharmacol Bull** 1981 Jan;17(1):72–5

HYDROXYTRYPTOPHAN

Management of depression with serotonin precursors. van Praag HM. **Biol Psychiatry** 1981 Mar;16(3):291–310

Simultaneous determination of femtomole quantities of 5–hydroxytryptophan, serotonin and 5–hydroxyindoleacetic acid in brain using HPLC with electrochemical detection. Lacković Z, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):347–52

New and highly sensitive assay for L–5–hydroxytryptophan decarboxylase activity by high–performance liquid chromatography–voltammetry. Rahman MK, et al. **J Chromatogr** 1980 Dec 12;221(2):265–70

Denervation supersensitivity to 5–hydroxytryptophan in rats following spinal transection and 5,7–dihydroxytryptamine injection. Barbeau H, et al. **Neuropharmacology** 1981 Jun;20(6):611–6

L–5–Hydroxytryptophan–induced drinking in rats: possible mechanisms for induction. Threatte RM, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):385–91

HYPERKINESIS

Serum serotonin, free tryptophan and plasma cyclic AMP levels in autistic children –with special reference to their relation to hyperkinesia. Hoshino Y, et al. **Fukushima J Med Sci** 1979;26(3–4):79–91

Predictors of adolescent height and weight in hyperkinetic boys treated with methylphenidate [proceedings] Loney J, et al. **Psychopharmacol Bull** 1981 Jan;17(1):132–4

Analysis of pemoline in serum by high performance liquid chromatography: clinical application to optimize treatment of hyperactive children. Tomkins CP, et al. **Ther Drug Monit** 1980; 2(3):255–60

HYPERKINETIC SYNDROME

Plasma free and total tryptophan, blood serotonin, and the hyperactivity syndrome: no evidence for the serotonin deficiency hypothesis. Ferguson HB, et al. **Biol Psychiatry** 1981 Mar;16(3):231–8

Evaluation of the relative effectiveness of methylphenidate and cognitive behavior modification in the treatment of kindergarten-aged hyperactive children. Cohen NJ, et al. **J Abnorm Child Psychol** 1981 Mar;9(1):43–54

Differential effects of parent training and stimulant medication with hyperactives: A progress report. Firestone P, et al. **J Am Acad Child Psychiatry** 1981 Winter;20(1):135–47

Growth hormone, prolactin, and growth responses in hyperkinetic males treated with d-amphetamine. Greenhill LL, et al. **J Am Acad Child Psychiatry** 1981 Winter;20(1):84–103

A review of some alternative approaches to drug management of hyperactivity in children. Walden EL, et al. **J Learn Disabil** 1981 Apr; 14(4):213–7, 238 (36 ref.)

'Hyperactivity' : still a maze of questions [editorial] Chamberlein HR. **JDPB** 1980 Sep;1(3):99–101

Potential risk of prolonged administration of stimulant medication for hyperactive children. Satterfield JH. et al. **JDPB** 1980 Sep; 1(3):102–7

Computer analyzed EEG in amphetamine-responsive hyperactive children. McIntyre HB, et al. **Psychiatry Res** 1981 Apr;4(2):189–97

The hyperactive child syndrome: peripheral sympathetic nervous system function and the effect of d-amphetamine. Mikkelsen E, et al. **Psychiatry Res** 1981 Apr;4(2):157–69

IMIPRAMINE

Antidepressants and alpha 2-adrenergic autoreceptor desensitization. Siever LJ, et al. **Am J Psychiatry** 1981 May;138(5):681–2

Effects of Ro 11-2465, a new psychotropic agent on the uptake of serotonin by human platelets—in vitro determination of the IC50. Lenehan T, et al. **Arch Int Pharmacodyn Ther** 1981 Jan; 249(1):147–52

The effect of amoxapine and imipramine on serum prolactin levels. Cooper DS, et al. **Arch Intern Med** 1981 Jul;141(8):1023–5

2-nitroimipramine: a selective irreversible inhibitor of [3H] serotonin uptake and [3H] imipramine binding in platelets. Rehavi M, et al. **Biochem Biophys Res Commun** 1981 Apr 15;99(3):954–9

Regional distribution of [3H]imipramine binding in rat brain. Palkovits M, et al. **Brain Res** 1981 Apr 6;210(1–2):493–8

Reversed-phase liquid chromatography for the separation of chloropromazine, imipramine and some of their metabolites. Fekete J, et al. **J Chromatogr** 1981 Jan 16;204:319–27

Determination of clomipramine or imipramine and their mono-demethylated metabolites in human blood or plasma by high-performance liquid chromatography. Godbillon J, et al. **J Chromatogr** 1981 Jan 16;204:303–11

Inhibition of riboflavin metabolism in rat tissues by chlorpromazine, imipramine, and amitriptyline. Pinto J, et al. **J Clin Invest** 1981 May; 67(5):1500–6

Agoraphobia: the 'what if' syndrome. Fier M. **J Med Soc NJ** 1981 Apr; 78(4):286–8

Prenatal exposure to imipramine alters early behavioral development and beta adrenergic receptors in rats. Jason KM, et al. **J Pharmacol Exp Ther** 1981 May;217(2):461–6

Effect of imipramine on central 5-hydroxytryptamine turnover and metabolism in rats. Segawa T, et al. **Jpn J Pharmacol** 1980 Dec; 30(6):789–93

An enhanced sensitivity of muscarinic cholinergic receptor associated with dopaminergic receptor subsensitivity after chronic antidepressant treatment. Koide T, et al. **Life Sci** 1981 Mar 9;28(10):1139–45

Circadian acetylcholine receptor rhythm in rat brain and its modification by imipramine. Kafka MS, et al. **Neuropharmacology** 1981 May; 20(5):421–5

Prophylactic lithium with and without imipramine for bipolar I patients: a double-blind study [proceedings] Kane JM, et al. **Psychopharmacol Bull** 1981 Jan;17(1):144–5

Factors which affect antidepressant drug responses in a multicenter controlled trial [proceedings] Logue JN, et al. **Psychopharmacol Bull** 1981 Jan;17(1):138–9

Lithium and imipramine in the prophylaxis of unipolar and bipolar II depression: a prospective, placebo-controlled comparison [proceedings] Quitkin FM, et al. **Psychopharmacol Bull** 1981 Jan;17(1):142–4

[On the effect of imipramine on blood composition, glucose level and alkaline phosphatase activity of leucocytes in non-emotive Wistar rats and animals of inbred TMB strain (author's transl)] Freund D, et al. **Arzneimittelforsch** 1981;31(3):425–8 (Eng. Abstr.) (Ger)

IPRONIAZID

The inhibitory action of L-dihydroxyphenylalanine (L-dopa) in the presence of a monoamine oxidase inhibitor on protein synthesis in vivo and the partial amelioration of this by methionine supplementation. Bone AH, et al. **Biochem J** 1980 Nov 15;192(2):703–7

Hydrazine formation from iproniazid. Hsu KY, et al. **J Pharmacobiodyn** 1980 Nov;3(11):620–7

ISOCARBOXAZID

Effect of adrenoceptor blocker and MAOI on postcoital utero-oviductal contractility, sperm transport, and sperm attachment to eggs in rabbits. Marsafy YM, et al. **Arch Androl** 1981 Jun;6(4):307–16

JUDGMENT

Public judgments on the importance of valium information [proceedings] Fisher S, et al. **Psychopharmacol Bull** 1981 Jan;17(1):134

LACTATES

[Lactic acid in the blood of heifers after administration of adrenaline and its relationship to pregnancy] Hintnaus J. **Vet Med (Praha)** 1981 Feb; 26(2):95–100 (Eng. Abstr.) (Cze)

LEARNING

Involvement of serotonin and catecholamine metabolism in cats trained to perform a delayed response task. Vachon L, et al. **Neuroscience** 1981; 6(2):189–94

Impairment of learning or memory in the mature and old rat by diazepam. Komiskey HL, et al. **Psychopharmacology (Berlin)** 1981;73(3):304–5

LEARNING DISORDERS

Residual attentional deficits in adolescents. Clampit MK. **J Learn Disabil** 1981 Apr;14(4):218–9

LEVODOPA

The inhibitory action of L-dihydroxyphenylalanine (L-dopa) in the presence of a monoamine oxidase inhibitor on protein synthesis in vivo and the partial amelioration of this by methionine supplementation. Bone AH, et al. **Biochem J** 1980 Nov 15;192(2):703–7

The catecholamine precursor L-3,4-dihydroxyphenylalanine inhibits both heat production and heat loss mechanisms in the rabbit. Lin MT. **Can J Physiol Pharmacol** 1980 Aug;58(8):956–64

L-dopa enhances acquisition of an inhibitory avoidance response. Martinez JL Jr, et al. **Commun Psychopharmacol** 1980;4(3):215–8

Studies on the mechanisms of L-dopa-induced salivary secretion. Pazo JH, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):255–61

Maintenance by L-DOPA treatment of estrous cycles and LH response to estrogen in aging female rats. Forman LJ, et al. **Exp Aging Res** 1980 Dec;6(6):547–54

Drugs to boost sexual potency. Kent S. **Geriatrics** 1981 Jul; 36(7):158–66

Chronic L-DOPA treatment of mice: a behavioural and biochemical study. Bailey R, et al. **J Neural Transm** 1981;50(2–4):209–24

Conversion of 3, 4-dihydroxyphenylalanine and deuterated 3, 4-dihydroxyphenylalanine to alcoholic metabolites of catecholamines in rat brain. Edwards DJ, et al. **J Neurochem** 1981 May; 36(5):1641–7

LH

Direct evidence in men for a role of endogenous oestrogens on gonadotrophin release. D'Agata R, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):145–9

Existence of multiple molecular forms of luteinizing hormone in rat: differences in immunological and biological activities between stored and circulating forms. Reddy PV, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):33–41

Qualitative and quantitative differences in the isoelectrofocusing profile of biologically active lutropin in the blood of normally menstruating and post-menopausal women. Strollo F, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):166–75

Effect of calcium and potassium on basal and gonadotrophin-releasing hormone (GnRH) stimulated release of luteinizing hormone (LH). Zolman JC, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):26–32

Differential effects of cyclic nucleotide analogues and GnRH on LH synthesis and release. Liu TC, et al. **Am J Physiol** 1981 Jul; 241(1):E6–13

Perifused pituitary cultures: a model for LHRH regulation of LH secretion. Loughlin JS, et al. **Am J Physiol** 1981 Jun;240(6):E591–6

Perifusion of rat pituitaries: requirements for optimal GnRH-stimulated LH release. Stern JE, et al. **Am J Physiol** 1981 May;240(5):E504–9

LH responses to LHRH, DBcAMP, and 17 beta-estradiol in cultures derived from aged rats. Tang LK, et al. **Am J Physiol** 1981 May; 240(5):E510–8

Effect of inhibitors of catecholamine synthesis on the pituitary response to LH-RH. Rettori V, et al. **Arch Androl** 1981 Mar;6(2):151–4

Release of LH and FSH by anterior pituitary cell suspensions from female rats during the estrous cycle and from estrogen-treated ovariectomized rats. Baldwin DM, et al. **Biol Reprod** 1981 Apr;24(3):581–90

Role of the ovary in controlling luteinizing hormone, follicle stimulating hormone, and prolactin secretion during and after lactation in pigs. Stevenson JS, et al. **Biol Reprod** 1981 Mar;24(2):341–53

Inhibition of LH and prolactin release in the cycling rat following inhibition of dopamine-beta-hydroxylase. Voogt JL, et al. **Brain Res** 1981 Mar 30;209(2):411–9

A reevaluation of the refractory period following the estrogen-induced luteinizing hormone surge in the rhesus monkey. Weick RF. **Can J Physiol Pharmacol** 1980 Aug;58(8):995–8

A radioimmunoassay for a highly active luteinizing hormone-releasing hormone analogue and relation between the serum level of the analogue and that of gonadotropin. Yamazaki I, et al. **Endocrinol Jpn** 1980 Oct; 27(5):593–605

Regulation of adrenal and testicular prolactin receptors by adrenocorticotropin and luteinizing hormone. Katikineni M, et al. **Endocrinology** 1981 Jun;108(6):2367–74

In vitro effect of danazol on luteinizing hormone-releasing hormone-stimulated luteinizing hormone release in rat anterior pituitary cell cultures in vitro. Menon M, et al. **Endocrinology** 1981 Jul; 109(1):191–6

Catecholamine turnover rates in discrete hypothalamic areas and associated changes in median eminence luteinizing hormone-releasing hormone and serum gonadotropins on proestrus and diestrous day 1. Rance N, et al. **Endocrinology** 1981 May;108(5):1795–802

The actions of porcine follicular fluid and estradiol on periovulatory secretion of gonadotropic hormones in rats. Rush ME, et al. **Endocrinology** 1981 Jun;108(6):2316–23

Maintenance by L-DOPA treatment of estrous cycles and LH response to estrogen in aging female rats. Forman LJ, et al. **Exp Aging Res** 1980 Dec;6(6):547–54

Comparison between the effects of LH-RH and raised K+ concentration on release of LH from pituitary glands of female rats in vitro. de Koning J, et al. **FEBS Lett** 1981 Apr 20;126(2):199–202

A priming effect of luteinizing hormone releasing hormone on bovine pituitary cells in vitro. Padmanabhan V, et al. **J Anim Sci** 1981 May; 52(5):1137–42

The effect of histamine and H1 and H2 receptors on prolactin and luteinizing hormone release in humans: sex differences and the role of stress. Pontiroli AE, et al. **J Clin Endocrinol Metab** 1981 May; 52(5):924–8

Gonadotrophin release in vitro, in the presence and absence of luteinizing hormone releasing hormone, by pituitary glands from ovariectomized and sham-operated immature female rats of various ages. Dullaart J. **J Endocrinol** 1981 Mar;88(3):375–9

Importance of the episodic nature of luteinizing hormone secretion for normal development of the bovine testis during puberty: interference with oestradiol-17 beta. Schanbacher BD. **J Endocrinol** 1981 Mar; 88(3):393–400

Pituitary function during pseudopregnancy and lactation in the rat. Taya K, et al. **J Reprod Fertil** 1981 May;62(1):93–3

Effect of electrical stimulation of the dorsomedial hypothalamic nucleus on pulsatile LH release in ovariectomized rats. Gallo RV. **Neuroendocrinology** 1981 Mar;32(3):134–8

Further studies on dopamine-induced suppression of pulsatile LH release in ovariectomized rats. Gallo RV. **Neuroendocrinology** 1981 Mar; 32(3):187–92

Interrelationship between pineal gland and hypothalamic-hypophyseal complex. IV. Effect of pinealectomy on luteinizing function of rat hypophysis. Krivosheev OG, et al. **Neurosci Behav Physiol** 1980 Nov-Dec;10(6):480–4

Inhibition of LH-release by synthetic analogues of LH-RH in rat pituitary cell culture. Nikolics K, et al. **Peptides (Fayetteville)** 1981 Spring; 2(1):65–73

LH and prolactin in estrogenized female rats: response to LHRH. Vaticón MD, et al. **Rev Esp Fisiol** 1980 Dec;36(4):371–6

Delta9-tetrahydrocannabinol increase plasma testosterone concentrations in mice. Dalterio S, et al. **Science** 1981 Jul 31;213(4507):581–3

LH-FSH RELEASING HORMONE

Sensitivity of rat adenohypophyseal cells to estradiol and LHRH during long-term culture. Lagacé L, et al. **Am J Physiol** 1981 Jun; 240(6):E602–8

Differential effects of cyclic nucleotide analogues and GnRH on LH synthesis and release. Liu TC, et al. **Am J Physiol** 1981 Jul; 241(1):E6–13

Perifused pituitary cultures: a model for LHRH regulation of LH secretion. Loughlin JS, et al. **Am J Physiol** 1981 Jun;240(6):E591–6

Perifusion of rat pituitaries: requirements for optimal GnRH-stimulated LH release. Stern JE, et al. **Am J Physiol** 1981 May;240(5):E504–9

LH responses to LHRH, DBcAMP, and 17 beta-estradiol in cultures derived from aged rats. Tang LK, et al. **Am J Physiol** 1981 May; 240(5):E510–8

Effect of inhibitors of catecholamine synthesis on the pituitary response to LH-RH. Rettori V, et al. **Arch Androl** 1981 Mar;6(2):151–4

Human placental receptors for luteinizing hormone releasing hormone. Currie AJ, et al. **Biochem Biophys Res Commun** 1981 Mar 16; 99(1):332–8

A study of the applicability of QSAR calculation for peptide hormones. Nádasdi L, et al. **Biochem Biophys Res Commun** 1981 Mar 31; 99(2):451–7

Paradoxical effects of D-Trp6-LHRH in immature female rats correlated with changes in ACTH, prolactin, and corticosterone levels. Nekola MV, et al. **Biol Reprod** 1981 Apr;24(3):505–11

Increased postovulatory plasma follicle stimulating hormone levels in the luteinized unruptured follicle syndrome: a role for inhibin? Koninckx PR, et al. **Br J Obstet Gynaecol** 1981 May;88(5):525–9

Circadian variations in substance P, luliberin (LH-RH) and thyroliberin (TRH) contents in hypothalamic and extrahypothalamic brain nuclei of adult male rats. Kerdelhue B, et al. **Brain Res** 1981 Feb 16; 206(2):405–13

Ultrastructural localization of gonadotropin-releasing hormone in the porcine gonadotropic cells. Dacheux F. **Cell Tissue Res** 1981; 216(1):143–50

Correlative ontogenetic development of catecholamine- and LHRH-containing nerve endings in the median eminence of the rat. Ibata Y, et al. **Cell Tissue Res** 1981;216(1):31–8

Lack of effect of intravenous LHRH on plasma noradrenaline in man. Jürgensen HJ, et al. **Clin Endocrinol (Oxf)** 1980 Sep;13(3):249–52

The antigonadotropic activity of Lithospermum ruderale. II. The inhibition of LRF-induced gonadotropin release in vitro. Findley WE. **Contraception** 1981 Feb;23(2):157–62

Influence of the LH-RH analogue buserelin on cyclic ovarian function and on endometrium. A new approach to fertility control? Schmidt-Gollwitzer M, et al. **Contraception** 1981 Feb;23(2):187–95

A radioimmunoassay for a highly active luteinizing hormone-releasing hormone analogue and relation between the serum level of the analogue and that of gonadotropin. Yamazaki I, et al. **Endocrinol Jpn** 1980 Oct; 27(5):593–605

Binding characteristics of gonadotropin-releasing hormone receptors throughout the estrous cycle of the hamster. Adams TE, et al. **Endocrinology** 1981 Jun;108(6):2245–53

Pituitary and gonadal gonadotropin-releasing hormone receptors during sexual maturation in the rat. Dalkin AC, et al. **Endocrinology** 1981 May; 108(5):1658–64

Gonadotropin releasing hormone agonists stimulate oocyte meiosis and ovulation in hypophysectomized rats. Ekholm C, et al. **Endocrinology** 1981 May;108(5):2022–4

Dissociated changes of pituitary luteinizing hormone-releasing hormone (LHRH) receptors and responsiveness to the neurohormone induced by 17 beta-estradiol and LHRH in vivo in the rat. Ferland L, et al. **Endocrinology** 1981 Jul;109(1):87–93

Regulation of the second surge of follicle-stimulating hormone; effects of antiluteinizing hormone-releasing hormone serum and pentobarbital. Hasegawa Y, et al. **Endocrinology** 1981 Jul;109(1):130–5

Gonadotropin-releasing hormone analog and testosterone synergistically inhibit spermatogenesis. Heber D, et al. **Endocrinology** 1981 May; 108(5):2019–21

In vitro effect of danazol on luteinizing hormone-releasing hormone-stimulated luteinizing hormone release in rat anterior pituitary cell cultures in vitro. Menon M, et al. **Endocrinology** 1981 Jul; 109(1):191–6

Catecholamine turnover rates in discrete hypothalamic areas and associated changes in median eminence luteinizing hormone-releasing hormone and serum gonadotropins on proestrus and diestrous day 1. Rance N, et al. **Endocrinology** 1981 May;108(5):1795–802

Negative feedback effects of progesterone correlated with changes in hypothalamic norepinephrine and dopamine turnover rates, median eminence luteinizing hormone-releasing hormone, and peripheral plasma gonadotropins. Rance N, et al. **Endocrinology** 1981 Jun; 108(6):2194–9

The actions of porcine follicular fluid and estradiol on periovulatory secretion of gonadotropic hormones in rats. Rush ME, et al. **Endocrinology** 1981 Jun;108(6):2316–23

The lateral and medial median eminence: distribution of dopamine, norepinephrine, and luteinizing hormone-releasing hormone and the effect of prolactin on catecholamine turnover. Selmanoff M. **Endocrinology** 1981 May;108(5):1716–22

Estradiol as a gonadotropin releasing hormone in the rhesus monkey. Wildt L, et al. **Endocrinology** 1981 May;108(5):2011–3

Changes in radioimmunoassayable luteinizing hormone-releasing hormone in discrete brain areas of the rat at various times on proestrus, diestrous day 1, and after phenobarbital administration. Wise PM, et al. **Endocrinology** 1981 Jun;108(6):2179–85

Comparison between the effects of LH-RH and raised K+ concentration on release of LH from pituitary glands of female rats in vitro. de Koning

J, et al. **FEBS Lett** 1981 Apr 20;126(2):199-202

Synthesis, biological activity and resistance to enzymic degradation of luteinizing hormone--releasing hormone analogues modified at position 7. Hazum E, et al. **FEBS Lett** 1981 Jan 26;123(2):300-2

Results of three-times-per-week long-term administration of a luteinizing hormone-releasing hormone (LHRH) analog, D-Ser-(TBU)6-LHRH-(EA)10 in primary amenorrhea. Batrinos ML, et al. **Fertil Steril** 1981 May;35(5):515-20

TRH, GH-RIH, and LH-RH in metamorphosing Xenopus laevis. King JA, et al. **Gen Comp Endocrinol** 1981 May;44(1):20-7

Topochemically related hormone structures. Synthesis of partial retro-inverso analogs of LH-RH. Chaturvedi N, et al. **Int J Pept Protein Res** 1981 Jan;17(1):72-88

A priming effect of luteinizing hormone releasing hormone on bovine pituitary cells in vitro. Padmanabhan V, et al. **J Anim Sci** 1981 May; 52(5):1137-42

Absence of LH-RH binding sites in corpora lutea from rhesus monkeys (Macacca mulatta). Asch RH, et al. **J Clin Endocrinol Metab** 1981 Jul; 53(1):215-17

Relationship between human follicular fluid inhibin F activity and steroid content. Channing CP, et al. **J Clin Endocrinol Metab** 1981 Jun; 52(6):1193-8

Urinary excretion of immunoreactive luteinizing hormone-releasing hormone-like material in children correlation with pubertal development. Rettig K, et al. **J Clin Endocrinol Metab** 1981 Jun; 52(6):1150-5

Pregnancy after prolonged pulsatile administration of luteinizing hormone-releasing hormone in a patient with clomiphene-resistant secondary amenorrhea. Schoemaker J, et al. **J Clin Endocrinol Metab** 1981 May;52(5):882-5

Bisexual behavior in male rats treated neonatally with antibodies to luteinizing hormone-releasing hormone. Kalcheim C, et al. **J Comp Physiol Psychol** 1981 Feb;95(1):36-44

Gonadotrophin release in vitro, in the presence and absence of luteinizing hormone releasing hormone, by pituitary glands from ovariectomized and sham-operated immature female rats of various ages. Dullaart J. **J Endocrinol** 1981 Mar;88(3):375-9

Changes in responsiveness of dispersed pituitary cells to luteinizing hormone releasing hormone at different times of the oestrous cycle of the rat. Speight A, et al. **J Endocrinol** 1981 Apr;89(1):129-34

Changes in pituitary LHRH incorporation during the rat estrous cycle, and in rats made anovulatory by various experimental procedures. De Gaetani CF, et al. **J Endocrinol Invest** 1981 Jan-Mar;4(1):59-63

Ultrastructural localization of gonadotropin and luteinizing hormone releasing hormone in the pituitary gland of a teleost fish (the platyfish). Margolis-Kazan H, et al. **J Exp Zool** 1981 Jan;215(1):99-102

Effect of oestrogen and an LH-RH agonist on the release of gonadotrophins in ovariectomized ewes deprived of LH-RH. Fraser HM, et al. **J Reprod Fertil** 1981 May;62(1):131-40

Induction of delayed implantation in rats by LH-RH. Yoshinaga K. **J Reprod Fertil [Suppl]** 1981;29:131-3

Inhibition of HCG-induced cyclic AMP accumulation and steroidogenesis in rat luteal cells by an LHRH agonist. Massicotte J, et al. **J Steroid Biochem** 1981 Mar;14(3):239-42

Inhibition of the action of sex steroids by gonadotropin-releasing hormone (GnRH) agonists: a new biological effect. Sundaram K, et al. **Life Sci** 1981 Jan 5;28(1):83-8

The use of affinity matrices in the purification of inhibin from bovine follicular fluid. Jansen EH, et al. **Mol Cell Endocrinol** 1981 Feb; 21(2):109-17

Sertoli-Leydig cell communication via an LHRH-like factor. Sharpe RM, et al. **Nature** 1981 Apr 30;290(5809):785-7

Opiate receptors modulate LHRH and SRIF release from mediobasal hypothalamic neurons. Drouva SV, et al. **Neuroendocrinology** 1981 Mar; 32(3):163-7

Ionic channels involved in the LHRH and SRIF release from rat mediobasal hypothalamus. Drouva SV, et al. **Neuroendocrinology** 1981 Mar;32(3):155-62

Interrelationship between pineal gland and hypothalamic-hypophyseal complex. IV. Effect of pinealectomy on luteinizing function of rat hypophysis. Krivosheev OG, et al. **Neurosci Behav Physiol** 1980 Nov-Dec;10(6):480-4

Cellular characteristics of immunolabeled luteinizing hormone releasing hormone (LHRH) neurons. Kozlowski GP, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):37-46

Simultaneous monoamine histofluorescence and neuropeptide immunocytochemistry: I. Localization of catecholamines and gonadotropin-releasing hormone in the rat median eminence. McNeill TH, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):59-68

Inhibition of LH-release by synthetic analogues of LH-RH in rat pituitary cell culture. Nikolics K, et al. **Peptides (Fayetteville)** 1981 Spring; 2(1):65-73

Chromatographic and biologic analysis of ME and OVLT LHRH. Samson WK, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):97-102

LH and prolactin in estrogenized female rats: response to LHRH. Vaticón MD, et al. **Rev Esp Fisiol** 1980 Dec;36(4):371-6

Chronic effects of the stimulatory luteinizing hormone-releasing hormone analogue D-Ser (TBU) 6-EA 10-LRH on the gonadotrophin and gonadal steroid secretion in women with amenorrhoea. Skarin G, et al. **Ups J Med Sci** 1980;85(2):103-12

[Inhibin - a new ovarian hormone] Presl J. **Cesk Gynekol** 1981 Mar; 46(2):132-3 (Cze)

[Ultrastructure of female rat FSH gonadotrophs following two LH-RH stimulations (author's transl)] Seinsch W, et al. **Anat Anz** 1980; 148(3):207-13 (Eng. Abstr.) (Ger)

[Orientation studies of ovulation release in mice to test gonadotropic preparations. [illegible] FSH, PMSG and Gn-RH activity] Bergfeld J, et al. **Arch Exp Veterinaermed** 1981;35(1):143-8 (Eng. Abstr.) (Ger)

[Menstrual cycle changes during consecutive artificial insemination therapy and their treatment] Katzorke T, et al. **Fortschr Med** 1981 Apr 2;99(13):471-4 (Eng. Abstr.) (Ger)

[Endocrinology and diseases of the testis in children] Zweymüller E. **Wien Med Wochenschr** 1981 Feb 15;131(3):68-72 (Ger)

[Endocrinologic study of beta-thalassemia major] Monteverde R, et al. **Minerva Pediatr** 1980 Dec 15;32(23):1335-42 (Eng. Abstr.) (Ita)

[Effects of hypothalamic deafferentation and estrogen on the distribution and content of hypothalamic LHRH (author's transl)] Taketani Y. **Acta Obstet Gynaecol Jpn** 1981 May;33(5):625-34 (Eng. Abstr.) (Jpn)

[Primary amenorrhea possibly due to insufficient LH-RH secretion] Iwasa T, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 Oct; 32(10):1647-9 (Jpn)

LIPOTROPIN

Release of beta-lipotropin and beta-endorphin from rat hypothalami in vitro. Vermes I, et al. **Brain Res** 1981 Apr 27;211(1):248-54

Ultrastructural localization of corticotropin, beta-lipotropin, and alpha- and beta-endorphin in the porcine anterior pituitary. Dacheux F. **Cell Tissue Res** 1981;215(1):87-101

Effects of hypoxia on beta-endorphin and beta-lipotropin release in fetal, newborn, and maternal sheep. Wardlaw SL, et al. **Endocrinology** 1981 May;108(5):1710-5

Differentiation of MSH-, ACTH-, endorphin-, and LPH-containing cells in the hypophysis during embryonic and fetal development. Dupouy JP. **Int Rev Cytol** 1980;68:197-249 (277 ref.)

Chemistry and biosynthesis of pro-opiomelanocortin. ACTH, MSH's, endorphins and their related peptides. Chrétien M, et al. **Mol Cell Biochem** 1981 Jan 28;34(2):101-27 (232 ref.)

Secretory granules of an anterior pituitary cell line, AtT-20, contain only mature forms of corticotropin and beta-lipotropin. Gumbiner B, et al. **Proc Natl Acad Sci USA** 1981 Jan;78(1):318-22

LITHIUM

Preferential vulnerability of dendrites to lithium ion in rat brain and in nerve cell culture. Janka Z, et al. **Acta Neuropathol [Suppl] (Berl)** 1981; 7:44-7

The effect of chronic lithium treatment on the sialic acid content in rat brain synaptosomes. Edelfors S. **Acta Pharmacol Toxicol (Copenh)** 1981 Jan;48(1):61-4

Estimates of the prevalence of bipolar affective disorder. Methods based on treatment with lithium. Eastwood R, et al. **Acta Psychiatr Scand** 1981 Jan;63(1):83-90

Effect of antidepressants, lithium and electroconvulsive treatment on rat serum prolactin levels. Meltzer HY, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):100-2

Lithium therapy of children with chronic neutropenia. Chan HS, et al. **Am J Med** 1981 May;70(5):1073-7

Psychotropic drugs: lithium. Harris E. **Am J Nurs** 1981 Jul; 81(7):1311-5

Effects of lithium on memory. Christodoulou GN, et al. **Am J Psychiatry** 1981 Jun;138(6):847-8

Effect of lithium on glycine levels in patients with affective disorders. Deutsch SI, et al. **Am J Psychiatry** 1981 May;138(5):683-4

A case report of megaloblastic anemia secondary to lithium. Prakash R, et al. **Am J Psychiatry** 1981 Jun;138(6):849

Receptors, adenylate cyclase, depression, and lithium. Belmaker RH. **Biol Psychiatry** 1981 Apr;16(4):333-50

Relationship between lithium levels of saliva and serum [letter] Sethi N, et al. **Biol Psychiatry** 1981 Apr;16(4):413-4

Cerebral evoked potential changes produced by treatment with lithium carbonate. Straumanis JJ Jr, et al. **Biol Psychiatry** 1981 Feb; 16(2):113-29

Lithium effect on calcitonin secretion in the rat. Dupuy B, et al. **Biomedicine** 1980 Nov;33(7):207-8

Current concepts of lithium therapy [letter] Coppen A, et al. **Br J Hosp Med** 1981 Mar;25(3):309-10

Renal function in patients receiving long-term lithium therapy. Uldall PR, et al. **Can Med Assoc J** 1981 Jun 1;124(11):1471-4

Lithium and the mitogenic response of human lymphocytes. Bray J, et al. **Clin Immunol Immunopathol** 1981 May;19(2):284-8

Prophylactic effect of lithium against depression in cyclothymic patients: a life-table analysis. Peselow ED, et al. **Compr Psychiatry** 1981 May-Jun;22(3):257-64

The antidepressant effect of lithium. Arieli A, et al. **Curr Dev Psychopharmacol** 1981;6:165-90 (58 ref.)

Lithium updated. **Drug Ther Bull** 1981 Mar 13;19(6):21-4

The lithium clinic for treatment and prevention of manic depression: a cost benefit approach. Fieve RR. **Egypt J Psychiatry** 1979 Oct; 2(2):166-90

Effect of potassium and lithium ions on protein synthesis in the sea urchin embryo. Wolcott DL. **Exp Cell Res** 1981 Apr;132(2):464-7

Granulopoietic effects of lithium on human bone marrow in vitro. Richman CM, et al. **Exp Hematol** 1981 Apr;9(4):449-55

The spectrum of neutrons from A238Pu-Li source. Ing H, et al. **Health Phys** 1981 Mar;40(3):345-50

Adjuvant effects of lithium chloride on human mononuclear cells in suppressor-enriched and suppressor-depleted systems. Shenkman L, et al. **Immunopharmacology** 1981 Feb;3(1):1-8

Lithium response in the treatment of manic symptomatology. Channabasavanna SM, et al. **Indian J Med Res** 1980 Dec;72:908-9

Effects of indomethacin and methylprednisolone on renal elimination of lithium in the rat. Imbs JL, et al. **Int Pharmacopsychiatry** 1980; 15(3):143-9

Lithium induces abnormal calcium-regulated PTH release in dispersed bovine parathyroid cells. Brown EM. **J Clin Endocrinol Metab** 1981 May;52(5):1046-8

Steady-state lithium blood level fluctuations in man following administration of a lithium carbonate conventional and controlled-release dosage form. Caldwell HC, et al. **J Clin Pharmacol** 1981 Feb-Mar;21(2):106-9

Memory processing with lithium carbonate. Marusarz TZ, et al. **J Clin Psychiatry** 1981 May;42(5):190-2

Evidence that lithium alters phosphoinositide metabolism: chronic administration elevates primarily D-myo-inositol-1-phosphate in cerebral cortex of the rat. Sherman WR, et al. **J Neurochem** 1981 Jun; 36(6):1947-51

Lithium and the kidney. Singer I. **Kidney Int** 1981 Feb;19(2):374-87

Differential effects of short and long term lithium on tryptophan uptake and serotonergic function in cat brain. Swann AC, et al. **Life Sci** 1981 Jan 26;28(4):347-54

Lithium nephrotoxicity [letter] Johnson GF, et al. **Med J Aust** 1981 Apr 4;1(7):376

Effect of monovalent cations on the aggregation of tobacco mosaic virus by chondroitin sulfate. Sano Y, et al. **Microbiol Immunol** 1981; 25(2):155-61

The inhibitory effect of lithium of high-K induced contraction in guinea-pig taenia coli. Kishimoto T, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980;315(1):69-76

Monoamine uptake into synaptosomes from various regions of rat brain following lithium administration and withdrawal. Ahluwalia P, et al. **Neuropharmacology** 1981 May;20(5):483-7

Paradoxical effects of lithium on field potentials of dentate granule cells in slices of rat hippocampus. MacVicar BA, et al. **Neuropharmacology** 1981 May;20(5):489-96

Estimation of lithium dose requirement by lithium clearance, serum lithium and saliva lithium following a loading dose of lithium carbonate. Tyrer SP, et al. **Neuropsychobiology** 1981;7(3):152-8

Unit activity changes elicited in amygdala and neocortex of anaesthetized rats by intraperitoneal injection of lithium chloride. Reddy MM, et al. **Neurosci Lett** 1981 Mar 10;22(2):169-72

Feeding and selection of saccharin after injections of bombesin, LiCl, and NaCl. Kulkosky PJ, et al. **Peptides (Fayetteville)** 1981 Spring; 2(1):61-4

Particle size effects in thermoluminescent lithium fluoride. Driscoll CM, et al. **Phys Med Biol** 1981 Mar;26(2):321-7

Effects of dorsolateral tegmental lesions on amphetamine- and lithium-induced taste aversions. Wellman PJ, et al. **Physiol Behav** 1981 Feb;26(2):341-4

Lithium: some drug interactions. Kamlana SH, et al. **Practitioner** 1980 Dec;224(1350):1291-2

Manic-depressive disorder. Paykel ES, et al. **Practitioner** 1981 Jan; 225(1351):75-7, 79-81

Lithium in children of lithium-responding parents. McKnew DH, et al. **Psychiatry Res** 1981 Apr;4(2):171-80

Prophylactic lithium with and without imipramine for bipolar I patients: a double-blind study [proceedings] Kane JM, et al. **Psychopharmacol Bull** 1981 Jan;17(1):144-5

Effects of lithium carbonate and haloperidol on cognition in aggressive, hospitalized school age children [proceedings] Platt JE, et al. **Psychopharmacol Bull** 1981 Jan;17(1):123-5

Lithium and imipramine in the prophylaxis of unipolar and bipolar II depression: a prospective, placebo-controlled comparison [proceedings] Quitkin FM, et al. **Psychopharmacol Bull** 1981 Jan;17(1):142-4

Effect of lithium on reaction time—a study of diurnal variations. Elsass P, et al. **Psychopharmacology (Berlin)** 1981;72(3):279-82

The effect of long-term concurrent administration of chlorpromazine and lithium on the striatal and frontal cortical dopamine metabolism in rats. Eroglu L, et al. **Psychopharmacology (Berlin)** 1981;73(1):84-6

Effects of lithium carbonate on methylphenidate-induced mood, behavior, and cognitive processes. Huey LY, et al. **Psychopharmacology (Berlin)** 1981;73(2):161-4

Lithium effects on citrate metabolism in humans and rats. Mellerup ET, et al. **Psychopharmacology (Berlin)** 1981;73(1):75-6

Effects of lithium on behavioral reactivity: relation to increases in brain cholinergic activity. Russell RW, et al. **Psychopharmacology (Berlin)** 1981;73(2):120-5

What to watch for with lithium. Rosenberg JM, et al. **RN** 1981 Jul; 44(7):44-6

Lithium and T cell colonies. Fernandez LA, et al. **Scand J Haematol** 1980 Nov;25(5):382-4

Lithium and mania. Tosteson DC. **Sci Am** 1981 Apr; 244(4):164-6, 168, 171-2 et passim

Medical therapies for mood disorders alter the blood-brain barrier. Preskorn SH, et al. **Science** 1981 Jul 24;213(4506):469-71

[Lithium dosage and age] Kijne B, et al. **Ugeskr Laeger** 1981 Jan; 143(3):119-20 (Eng. Abstr.) **(Dan)**

[Lithium dose in relation to body weight and age in the preventive of relapses in manic-depressive psychosis] König L. **Agressologie** 1980; 21(A):15-7 (Eng. Abstr.) **(Ger)**

[Pharmacokinetic study of delayed-action lithium in affective psychoses] Molcan J, et al. **Agressologie** 1980;21(A):11-4 (Eng. Abstr.) **(Ger)**

[Lithium prophylaxis and renal function. Conclusions and guidelines for treatment control (author's transl)] Müller-Oerlinghausen B, et al. **Nervenarzt** 1981 Feb;52(2):113-5 **(Ger)**

[Endocrinological aspects of long-term lithium therapy] Jonderko G, et al. **Z Gesamte Inn Med** 1981 Feb 1;36(3):79-82 (Eng. Abstr.) **(Ger)**

[Lithium. A practical clinical review] Malt U. **Tidsskr Nor Laegeforen** 1981 Mar 30;101(9-10):549-54 (Eng. Abstr.) **(Nor)**

[Long-term use of lithium salts - endocrinological and biochemical aspects] Jonderko G, et al. **Pol Tyg Lek** 1981 Jan 5;36(1):23-5 (Eng. Abstr.) **(Pol)**

[Effect of lithium chloride on lymphocyte transformation] Sierakowski S, et al. **Pol Tyg Lek** 1981 Jan 12;36(2):63-4 (Eng. Abstr.) **(Pol)**

[Influence of lithium ions on glycolytic and oxidative enzymes of the subcellular fractions and synaptosome fractions of the rat cortex] Busuioc A, et al. **Rev Med Chir Soc Med Nat Iasi** 1980 Jul-Sep; 84(3):515-20 (Eng. Abstr.) **(Rum)**

[Geographical gradients of lithium concentration in surface and drinking waters and in plasma of exposed subjects in Northern Chile (author's transl)] Zaldivar R. **Rev Med Chil** 1980 Sep;108(9):822-4 (Eng. Abstr.) **(Spa)**

MATERNAL BEHAVIOR

Pituitary-adrenal responsiveness of mothers to pups in mice of two inbred strains. Hennessy MB, et al. **Behav Neural Biol** 1981 Mar; 31(3):304-13

Mother-infant interaction in rhesus monkeys treated clinically with delta-9-tetrahydrocannabinol. Golub MS, et al. **Child Dev** 1981 Mar; 52(1):389-92

Concentrations of pituitary, gonadal and adrenal hormones in serum of laying and broody white rock hens (Gallus domesticus). Bedrak E, et al. **J Endocrinol** 1981 May;89(2):197-204

Serum concentrations of prolactin, luteinizing hormone, growth hormone, corticosterone, progesterone, testosterone and oestradiol in relation to broodiness in domestic turkeys (Meleagris gallopavo). Harvey S, et al. **J Endocrinol** 1981 May;89(2):187-95

MEMORY

Impaired speed of visual information processing in marijuana intoxication. Braff DL, et al. **Am J Psychiatry** 1981 May;138(5):613-7

Effects of lithium on memory. Christodoulou GN, et al. **Am J Psychiatry** 1981 Jun;138(6):847-8

The pharmacology of memory: a neurobiological perspective. Squire LR, et al. **Annu Rev Pharmacol Toxicol** 1981;21:323-56 (203 ref.)

The effects of colchicine and vinblastine on memory in chicks. Bell GA, et al. **Behav Brain Res** 1981 May;2(3):301-22

Memory processing with lithium carbonate. Marusarz TZ, et al. **J Clin Psychiatry** 1981 May;42(5):190-2

Time dependent changes in anterograde scopolamine-induced amnesia in rats. Moss DE, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):321-3

Reversal of guanethidine- and diethyldithiocarbamate-induced amnesia by peripherally-administered catecholamines. Walsh TJ, et al. **Pharmacol Biochem Behav** 1981 May;14(5):713-8

Memory and performance effects of single and 3-week administration of diazepam. Ghoneim MM, et al. **Psychopharmacology (Berlin)** 1981; 73(2):147-51

Impairment of learning or memory in the mature and old rat by diazepam. Komiskey HL, et al. **Psychopharmacology (Berlin)** 1981;73(3):304-5

[Formation and preservation of conditioned taste aversion in dogs] Vavilova NM, et al. **Zh Vyssh Nerv Deiat** 1981 Jan-Feb;31(1):171-2 **(Rus)**

MENTAL DISORDERS

Treatment of the seriously disturbed adolescent. Miller D. **Adolesc Psychiatry** 1980;8:469–81

An interdisciplinary comparison of consultation outcomes. Psychiatry vs cardiology. Popkin MK, et al. **Arch Gen Psychiatry** 1981 Jul; 38(7):821–5

Low blood pressure in psychiatric inpatients. Masterton G, et al. **Br Heart J** 1981 Apr;45(4):442–6

The psychiatrically violent patient [letter] **Br Med J [Clin Res]** 1981 Mar 7;282(6266):821

Adverse effects of antidepressant drugs. Part 2: 'Second generation' antidepressants and rational decision making in antidepressant therapy. Blackwell B. **Drugs** 1981 Apr;21(4):273–82 (120 ref.)

Folic acid and B12 in autism and neuropsychiatric disturbances of childhood. Lowe TL, et al. **J Am Acad Child Psychiatry** 1981 Winter; 20(1):104–11

What's so special about my specialty? Psychiatric med nursing. Harvey S. **J Pract Nurs** 1981 Jun;31(6):27, 32

Self-medication of psychiatric patients. Lane DE. **J Psychiatr Nurs** 1981 May;19(5):27–8

A clinician's guide to the use of stimulant medication for the psychiatric disorders of children. Cantwell DP. **JDPB** 1980 Sep;1(3):133–40 (58 ref.)

Psychiatry. 4. Drugged to the eyeballs. Ross T. **Nurs Mirror** 1981 Apr 16;152(16):16–8

Psychiatric treatment in the aged. Jacobson SB. **NY State J Med** 1981 Apr;81(5):802–4

Methods of multicenter trials in psychiatry. Part I: Review. Fischer-Cornelssen KA. **Prog Neuropsychopharmacol** 1980; 4(6):545–60

Classification of drugs and patients to achieve maximum therapeutic response. Kline NS. **Prog Neuropsychopharmacol** 1980;4(4–5):491–4

Preliminary studies on CSF gamma-aminobutyric acid levels in psychiatric patients before and during treatment with different psychotropic drugs. Zimmer R, et al. **Prog Neuropsychopharmacol** 1980; 4(6):613–20

[Sultopride used at low doses in the older child and adolescent.] Hugonenq H, et al. **Neuropsychiatr Enfance Adolesc** 1980 Dec;28(12):593–7 (Fre)

[Neuropeptides and psychiatry report presented at the French-Swiss Psychiatric meeting in Bel-Air, Geneva, 4 May 1980] Taban CH. **Schweiz Arch Neurol Neurochir Psychiatr** 1981;128(1):85–103 (Eng. Abstr.) (Fre)

[Cooperation of pharmacotherapy and psychotherapy: an experimental illustration] Caplová T, et al. **Agressologie** 1980;21(A):37–9 (Eng. Abstr.) (Ger)

[Experience with reactivant in psychiatric patients] Guensberger E, et al. **Agressologie** 1980;21(A):63–5 (Eng. Abstr.) (Ger)

[Documentation of psychopathological data in psychopharmacotherapy] Kühne GE, et al. **Agressologie** 1980;21(A):1–5 (Eng. Abstr.) (Ger)

[Psychopharmacology in gerontopsychiatry] Kümpel Q. **Agressologie** 1980;21(A):67–9 (Eng. Abstr.) (Ger)

[Biologic psychiatric research and psychiatric pharmacotherapy. Critical remarks on methods (author's transl)] Benkert O, et al. **MMW** 1981 May 8;123(19):795–9 (Eng. Abstr.) (Ger)

[Psychopharmacology for the practising physician (author's transl)] Laemmel K. **Praxis** 1981 Feb 3;70(6):192–9 (Eng. Abstr.) (Ger)

[The course of long-term care with fluphenazine decanoate (Dapotum D)] Deiser R, et al. **Psychiatr Clin (Basel)** 1980;13(3–4):193–205 (Eng. Abstr.) (Ger)

[Psychopathologic changes during 20 days of antidepressive or neuroleptic therapy] Woggon B. **Psychiatr Clin (Basel)** 1980;13(3–4):150–64 (Eng. Abstr.) (Ger)

[Rehabilitation of persons with psychic disorders or handicaps in transitional facilities and its place within the social security system (author's transl)] Stroebel H. **Rehabilitation (Stuttg)** 1981 Feb; 20(1):42–4 (Eng. Abstr.) (Ger)

[Current extent of biological therapy of mental disorder. II.] Predescu V, et al. **Rev Med Interna [Neurol Psihiatr]** 1980 Oct–Dec; 25(4):241–51 (205 ref.) (Rum)

MENTAL PROCESSES

[Psychotropic drugs and imprisonment in a psychiatric hospital for political reasons] Drucker H. **Acta Med Leg Soc (Liege)** 1980; 30(1):189–210 (Fre)

[Psychotropic drugs and imprisonment] Maltaverne S. **Acta Med Leg Soc (Liege)** 1980;30(1):185–8 (Fre)

[Effect of certain pharamcologic preparations and different lighting setups on human work capacity] Bogatova RI, et al. **Kosm Biol Aviakosm Med** 1981 Jan–Feb;15(1):92–3 (Rus)

MEPROBAMATE

Severe meprobamate intoxication treated by hemoperfusion over amberlite resin. Freund LG. **Artif Organs** 1981 Feb;5(1):80–1

The poisoned pen. A case report. Vanstratt W. **Forensic Sci Int** 1981 Mar–Apr;17(2):152–6

[The influence of the polymorphism of the active substance on the properties of tablets. Part 3. Compressional behaviour of meprobamate (author's transl)] Burger A, et al. **Pharmazie** 1981;36(1):41–6 (Eng. Abstr.) (Ger)

METHYLPHENIDATE

Gas chromatographic/mass spectrometric analysis of methylphenidate (ritalin) in serum. Chan YM, et al. **Clin Biochem** 1980 Dec; 13(6):266–72

Effect of methylphenidate on young adult's vigilance and event-related potentials. Coons HW, et al. **Electroencephalogr Clin Neurophysiol** 1981 Apr;51(4):373–87

Methylphenidate-like stimulants in vitro release [3H]tyramines but not [14C]dopamine. Dyck LE. **Eur J Pharmacol** 1981 Jan 29;69(3):371–4

A comparison of the hypothermic effects of methylphenidate and d-amphetamine. Yehuda S, et al. **Int J Neurosci** 1981;13(2–3):117–20

Evaluation of the relative effectiveness of methylphenidate and cognitive behavior modification in the treatment of kindergarten-aged hyperactive children. Cohen NJ, et al. **J Abnorm Child Psychol** 1981 Mar;9(1):43–54

Differential effects of parent training and stimulant medication with hyperactives: A progress report. Firestone P, et al. **J Am Acad Child Psychiatry** 1981 Winter;20(1):135–47

Potential risk of prolonged administration of stimulant medication for hyperactive children. Satterfield JH, et al. **JDPB** 1980 Sep; 1(3):102–7

Predictors of adolescent height and weight in hyperkinetic boys treated with methylphenidate [proceedings] Loney J, et al. **Psychopharmacol Bull** 1981 Jan;17(1):132–4

Effects of lithium carbonate on methylphenidate-induced mood, behavior, and cognitive processes. Huey LY, et al. **Psychopharmacology (Berlin)** 1981;73(2):161–4

Methylphenidate in depression and states of apathy. Moore DP. **South Med J** 1981 Mar;74(3):347–8

METHYSERGIDE

Effects of the interaction between methysergide and clonidine on growth hormone and prolactin secretion in normal man. Agnati LF, et al. **Neurosci Lett** 1981 Feb 6;21(3):333–8

MMPI

Psychotherapeutic drug recommendations based on the Mini-Mult. Siddall JW, et al. **Psychol Rep** 1980 Dec;47(3 Pt 2):1283–8

MOTIVATION

The central basis of motivation: intracranial self-stimulation studies. Olds ME, et al. **Annu Rev Psychol** 1981;32:523–74 (246 ref.)

Reward and detection thresholds for brain stimulation: dissociative effects of cocaine. Kornetsky C, et al. **Brain Res** 1981 Mar 30; 209(2):496–500

MOTOR ACTIVITY

Effect of p-chlorophenylalanine and tryptophan on sleep, EEG and motor activity in the rat. Borbély AA, et al. **Behav Brain Res** 1981 Jan; 2(1):1–22

Behavioral supersensitivity to methamphetamine following chronic treatment with (—)-sulpiride in the rat. Montanaro N, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):401–6

Dopamine receptor changes following destruction of the nigrostriatal pathway: lack of a relationship to rotational behavior. Staunton DA, et al. **Brain Res** 1981 May 4;211(2):315–27

Intraventricular carbachol mimics the phase-shifting effect of light on the circadian rhythm of wheel-running activity. Zatz M, et al. **Brain Res** 1981 May 11;212(1):234–8

Cats develop tolerance to d-amphetamine's effects upon locomotion and stereotyped behaviors. Jacobs BL, et al. **Eur J Pharmacol** 1981 Jan 29; 69(3):353–6

Involvement of both dopaminergic and alpha-adrenergic receptors in the hypomotility induced by dibenzoyl-6,7-ADTN. Sumners C, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):541–50

Differential effects of maternal and sibling presence of hyperactivity of 6-hydroxydopamine-treated developing rats. Teicher MH, et al. **J Comp Physiol Psychol** 1981 Feb;95(1):134–45

The effect of bromazepam on psychomotor activity and subjective mood. Hobi V, et al. **J Int Med Res** 1981;9(2):89–97

Chronic L-DOPA treatment of mice: a behavioural and biochemical study. Bailey R, et al. **J Neural Transm** 1981;50(2–4):209–24

The effects of p-chloroamphetamine administration on locomotor activity and serotonin in neonatal and adult rats. Lucot JB, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):738–44

Drug-environment interaction: context dependency of cocaine-induced behavioral sensitization. Post RM, et al. **Life Sci** 1981 Feb 16;

28(7):755–60

The role of nigral projections to the thalamus in drug-induced circling behaviour in the rat. Reavill C, et al. **Life Sci** 1981 Mar 30; 28(13):1457–66

Similar motor effects of 5-HT and TRH in rats following chronic spinal transection and 5.7-dihydroxytryptamine injection. Barbeau H, et al. **Neuropharmacology** 1981 May;20(5):477–81

Self-stimulation and locomotor changes indicating 'latent' anticholinergic activity by an atypical neuroleptic (thioridazine). Herberg LJ, et al. **Neuropharmacology** 1981 Jan;20(1):55–60

Injections of dopaminergic, cholinergic, serotoninergic and GABAergic drugs into the nucleus accumbens: effects on locomotor activity in the rat. Jones DL, et al. **Neuropharmacology** 1981 Jan;20(1):29–37

Apomorphine-induced circling behaviour in hamsters following unilateral injection of scrapie gent in the striatum. Gorde JM, et al. **Neurosci Lett** 1981 Mar 10;22(2):201–4

Influence of substance P on the behavioral changes induced by haloperidol in rats. Jolicoeur FB, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):103–7

Interaction of MIF-I or alpha-MSH with D-amphetamine or chlorpromazine on thermoregulation and motor activity of rats maintained at different ambient temperatures. Yehuda S, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):243–8

The effects cocaine free extracts of the coca leaf on food consumption and locomotor activity. Bedford JA, et al. **Pharmacol Biochem Behav** 1981 May;14(5):725–8

Different effects of apomorphine on locomotor activity in C57BL/6 and DBA/2 mice. Sansone M, et al. **Pharmacol Biochem Behav** 1981 May; 14(5):741–3

Effects of morphine and chlordiazepoxide on locomotor activity in two inbred strains of mice. Cuomo V, et al. **Pharmacol Res Commun** 1981 Jan;13(1):87–93

Role of the pulvinar-lateral posterior nucleus complex in turning behavior. Motles E, et al. **Physiol Behav** 1980 Dec;25(6):921–9

Effects of propranolol on the locomotor stimulation induced by activation of postsynaptic catecholamine receptors. Hallberg H, et al. **Psychopharmacology (Berlin)** 1981;72(3):227–31

Dopaminergic agonists differentially affect open-field activity of rats with A10 lesions. Hodge GK, et al. **Psychopharmacology (Berlin)** 1981; 73(1):39–42

Lesion of serotonergic neurons antagonizes clonidine induced suppression of avoidance behavior and locomotor activity in rats. Kostowski W, et al. **Psychopharmacology (Berlin)** 1981;73(3):261–4

[Locomotor activity of rats following chronic pretreatment with haloperidol] Oehler J, et al. **Acta Biol Med Ger** 1980; 39(11–12):1235–9 (Eng. Abstr.) **(Ger)**

[Evaluation of motor behavior in conditions of hyperprolactinemia] Rampello L, et al. **Acta Neurol (Napoli)** 1981 Feb;36(1):297–301 (Eng. Abstr.) **(Ita)**

[Diphasic action of apomorphine on motility of the rat. I. Dose-effect relationship in exploratory and basal motility] Vaccheri A, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):374–80 (Eng. Abstr.) **(Ita)**

[Diphasic action of apomorphine on motility in the rat. II. Time aspects of the effect of a single dose] Vaccheri A, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):381–6 (Eng. Abstr.) **(Ita)**

[Certain biochemical and behavioral effects of morphine in rats following amyzil administration] Bandman AL, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):185–8 (Eng. Abstr.) **(Rus)**

[State of the endocrine glands in hypodynamia (a review of the literature)] Korkach VI. **Vrach Delo** 1981 Feb;(2):11–6 (73 ref.) **(Rus)**

MSH

Cytological localization of alpha-MSH, ACTH and beta-endorphin in the pars intermedia of the cichlid teleost Sarotherodon mossambicus. van Eys GJ, et al. **Cell Tissue Res** 1981;215(3):625–33

Evidence for two different turnover pools of adrenocorticotropin, alpha-melanocyte-stimulating hormone, and endorphin-related peptides released by the frog pituitary neurointermediate lobe. Loh YP, et al. **Endocrinology** 1981 Jul;109(1):54–61

Differentiation of MSH-, ACTH-, endorphin-, and LPH-containing cells in the hypophysis during embryonic and fetal development. Dupouy JP. **Int Rev Cytol** 1980;68:197–249 (277 ref.)

Effect gamma-melanotropin (gamma-MSH) on the conditioned behavior. Oka M, et al. **J Pharmacobiodyn** 1980 Nov;3(11):628–30

Chemistry and biosynthesis of pro-opiomelanocortin. ACTH, MSH's, endorphins and their related peptides. Chrétien M, et al. **Mol Cell Biochem** 1981 Jan 28;34(2):101–27 (232 ref.)

Circulating human pituitary pro-gamma-melanotropin enhances the adrenal response to ACTH. Al-Dujaili EA, et al. **Nature** 1981 May 14;291(5811):156–9

The Yawning elicited by alpha-melanocyte-stimulating hormone involves serotonergic-dopaminergic-cholinergic neuron link in rats. Yamada K, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr; 316(2):155–60

Interaction of MIF-I or alpha-MSH with D-amphetamine or chlorpromazine on thermoregulation and motor activity of rats maintained at different ambient temperatures. Yehuda S, et al. **Peptides (Fayetteville)** 1980 Fall;1(3):243–8

Localization of gamma-melanocyte stimulating hormone (gamma MSH) immunoreactivity in rat brain and pituitary. Bloom FE, et al. **Regul Pept** 1980 Dec;1(3):205–22

The regional distribution of gamma 3-melanotropin-like peptides in bovine brain is correlated with adrenocorticotropin immunoreactivity but not with beta-endorphin. Shibasaki T, et al. **Regul Pept** 1981 Apr; 2(1):43–52

NEUROREGULATORS

An introduction to the immunocytochemical localization of neuropeptides and neurotransmitters. van Leeuwen FW. **Acta Histochem [Suppl] (Jena)** 1981;24:49–77 (162 ref.)

Ultrastructural and morphometric investigations on the mechanism of neurotransmitter release from synaptic vesicles. Dymecki J, et al. **Acta Neuropathol [Suppl] (Berl)** 1981;7:381–5

Role of calmodulin in neurotransmitter release and synaptic function. DeLorenzo RJ. **Ann NY Acad Sci** 1980;356:92–109

Dietary precursors and brain neurotransmitter formation. Fernstrom JD. **Annu Rev Med** 1981;32:413–25 (49 ref.)

Hypothalamic hypophysiotropic hormones and neurotransmitter regulation: current views. Meites J, et al. **Annu Rev Pharmacol Toxicol** 1981;21:295–322 (160 ref.)

Excitatory amino acid transmitters. Watkins JC, et al. **Annu Rev Pharmacol Toxicol** 1981;21:165–204 (294 ref.)

Biochemical specificity of septal hyperreactivity: a behavioral discrimination. Chafetz MD, et al. **Behav Brain Res** 1981 May; 2(3):409–20

Morphological and biochemical studies on the ontogenesis of the nucleus locus coeruleus. Sievers J, et al. **Bibl Anat** 1981;(19):52–130

Neurochemistry of man: noninvasive approaches. Agranoff BW. **Biol Psychiatry** 1981 Mar;16(3):211–2

Glutamate mimics the afferent transmitter in the Xenopus laevis lateral line. Bobbin RP, et al. **Birth Defects** 1980;16(4):107–9

The role of calcium in the effects of noradrenaline and phenoxybenzamine on adrenergic transmitter release from atria: no support for negative feedback of release. Kalsner S. **Br J Pharmacol** 1981 Jun; 73(2):363–71

An examination of the residual calcium theory for facilitation of transmitter release. Bittner GD, et al. **Brain Res** 1981 Apr 6; 210(1–2):431–6

Monoaminergic afferents to the neocortex: a developmental histofluorescence study in normal and Reeler mouse embryos. Caviness VS Jr, et al. **Brain Res** 1981 Mar 23;209(1):1–9

The influence of striatal stimulation and putative neurotransmitters on identified neurones in the rat substantia nigra. Collingridge GL, et al. **Brain Res** 1981 May 18;212(2):345–59

Neuronal, glial and meningeal localizations of neurotransmitter-sensitive adenylate cyclases in cerebral cortex of mice. Ebersolt C, et al. **Brain Res** 1981 May 25;213(1):139–50

The membrane potential of cat hippocampal neurons recorded in vivo displays four different reaction-mechanisms to iontophoretically applied transmitter agonists. Herrling PL. **Brain Res** 1981 May 18; 212(2):331–43

Behavioral evidence that substance P may be a spinal cord sensory neurotransmitter. Piercey MF, et al. **Brain Res** 1981 Apr 6; 210(1–2):407–12

Barbiturates and transmitter release at the frog neuromuscular junction. Pincus JH, et al. **Brain Res** 1981 May 25;213(1):127–37

Characterization of the isolated perfused mouse brain as a system for neurochemical studies. Towell JF, et al. **Brain Res** 1981 Mar 30; 209(2):476–81

Baclofen modifies via the release of monoamines the synaptic depression, frequency facilitation, and posttetanic potentiation observed at an identified cholinergic synapse of Aplysia californica. Philippe E, et al. **Can J Physiol Pharmacol** 1981 Mar;59(3):244–52

Effects of precursors on brain neurotransmitter synthesis and brain functions. Fernstrom JD. **Diabetologia** 1981 Mar;20 Suppl:281–9 (43 ref.)

Octopamine—after a decade as a putative neuroregulator. Robertson HA. **Essays Neurochem Neuropharmacol** 1981;5:47–73 (83 ref.)

Neurotransmitter control of hypothalamic-pituitary-thyroid function in rats. Morley JE, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):263–71

Localization of putative amino acid neurotransmitters in the human retina. Lam DM, et al. **Exp Eye Res** 1980 Dec;31(6):729–32

A simple perfusion chamber for studying neurotransmitter release from cells maintained in monolayer culture. Pearce BR, et al. **J Neurosci Methods** 1981 Feb;3(3):255–9

The K+ liquid ion exchange electrode system: responses to drugs and neurotransmitters. Kuramoto T, et al. **J Neurosci Res** 1951; 6(1):37–48

Calcium dependence of evoked transmitter release at very low quantal contents at the frog neuromuscular junction. Andreu R, et al. **J Physiol (Lond)** 1980 Nov;308:79–97

Possible embryogenetical differences of the dog venous system in sensitivity to vasoactive substances. Ishikawa N, et al.

Jpn J Pharmacol 1980 Dec;30(6):807-18

Pharmacological antagonists of excitant amino acid action. Evans RH, et al. **Life Sci** 1981 Mar 23;28(12):1303-8

Role of intracellular proteins in the regulation of calcium action and transmitter release during exocytosis. Pollard HB, et al. **Monogr Neural Sci** 1980;7:106-16

Contralateral denervation causes enhanced transmitter release from frog motor nerve terminals. Herrera AA, et al. **Nature** 1981 Jun 11; 291(5815):495-7

Sustained potentiation of transmitter release by adrenaline and dibutyryl cyclic AMP in sympathetic ganglia. Kuba K, et al. **Nature** 1981 Jun 25;291(5817):654-6

Possible role of 'prenervous' neurotransmitters in cellular interactions of early embryogenesis: a hypothesis. Buznikov GA, et al. **Neurochem Res** 1981 Jan;6(1):55-68

Regional distribution of neurohumoral responsive adenylate cyclase in rabbit brain microvessels. Palmer GC. **Neurosci Lett** 1981 Jan 20; 21(2):207-10

Excitatory amino acids as transmitter candidates of vibrissae afferent fibres to the rat trigeminal nucleus caudalis. Salt TE, et al. **Neurosci Lett** 1981 Mar 10;22(2):183-7

Modelling the postsynaptic location and magnitude of tonic conductance changes resulting from neurotransmitters or drugs. Carlen PL, et al. **Neuroscience** 1981;6(5):839-46

Biochemical evidence for glutamate as neurotransmitter in corticostriatal and corticothalamic fibres in rat brain. Fonnum F, et al. **Neuroscience** 1981;6(5):863-73

Regional changes of monoamines in cerebral cortex and subcortical structures of aging rhesus monkeys. Goldman-Rakic PS, et al. **Neuroscience** 1981;6(2):177-87

Substance P as a baro- and chemoreceptor afferent neurotransmitter: immunocytochemical and neurochemical evidence in the rat. Helke CJ, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):1-9

Brain neurotransmitters regulating TRH producing neurons. Annunziato L, et al. **Pharmacol Res Commun** 1981 Jan;13(1):1-10 (47 ref.)

Intracellular injection of t he catalytic subunit of cyclic AMP-dependent protein kinase simulates facilitation of transmitter release underlying behavioral sensitization in Aplysia. Castellucci VF, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7492-6

Central neurotransmitter mechanisms involved in the control of urinary bladder function. An experimental study in the rat. Sillén U. **Scand J Urol Nephrol [Suppl]** 1980;58:1-45

Pentapeptide (proctolin) associated with an identified neuron. O'Shea M, et al. **Science** 1981 Jul 31;213(4507):567-9

[Information transfer in the brain puzzles neuroscientists] Hyyppä MT. **Duodecim** 1980;96(11):769-72 (Fin)

[In vitro study of the interaction between neuromediators and neuropeptides involved in hypothalamic neurosecretion control (author's transl)] Epelbaum J, et al. **Ann Endocrinol (Paris)** 1980 Nov-Dec;41(6):478-86 (35 ref.) (Eng. Abstr.) (Fre)

[Neuropeptides and psychiatry report presented at the French-Swiss Psychiatric meeting in Bel-Air, Geneva, 4 May 1980] Taban CH. **Schweiz Arch Neurol Neurochir Psychiatr** 1981;128(1):85-103 (Eng. Abstr.) (Fre)

[Parameters of a model of transmitter depletion in synapses of identified snail neurons] Voronin LL, et al. **Neirofiziologiia** 1981;13(1):88-97 (Eng. Abstr.) (Rus)

[Significance of neuroregulatory interrelationships in the science of transplantation] Konevskiĭ AG, et al. **Vestn Khir** 1980 Dec; 125(12):88-91 (Eng. Abstr.) (Rus)

[Acetylcholine-bradykinin: a new peptide-amine transmitter interaction (editorial)] Pirola CJ. **Medicina (B Aires)** 1980 Nov-Dec; 40(6 Pt 2):893-5 (Spa)

NEUROTENSIN

Plasma neurotensin in term and preterm neonates. Lucas A, et al. **Acta Paediatr Scand** 1981 Mar;70(2):201-6

Neurotensin release by rat hypothalamic fragments in vitro. Maeda K, et al. **Brain Res** 1981 Apr 6;210(1-2):261-9

Neurotensin receptor localization by light microscopic autoradiography in rat brain. Young WS 3d, et al. **Brain Res** 1981 Feb 16; 206(2):273-85

Effect of intraventricular injection of neurotensin and other various bioactive peptides on plasma immunoreactive somatostatin levels in rat hypophysial portal blood. Abe H, et al. **Endocrinology** 1981 May; 108(5):1939-43

The hypotensive effect of centrally administered neurotensin in rats. Rioux F, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):241-7

Neurotensin blocks certain amphetamine-induced behaviours. Ervin GN, et al. **Nature** 1981 May 7;291(5810):73-6

Bacterial peptides with C-terminal similarities to bovine neurotensin. Bhatnagar YM, et al. **Peptides (Fayetteville)** 1981 Spring;2(1):51-9

Immunochemical characterization of neurotensin-like peptides in chicken. Carraway R, et al. **Peptides (Fayetteville)** 1980 Summer;1(2):159-65

Isolation, structure and biologic activity of chicken intestinal neurotensin. Carraway R, et al. **Peptides (Fayetteville)** 1980 Summer;1(2):167-74

NEUROTIC DISORDERS

The relationships between clinical response, psychophysiological variables and plasma levels of amitriptyline and diazepam in neurotic outpatients. Johnstone EC, et al. **Psychopharmacology (Berlin)** 1981;72(3):233-40

NIALAMIDE

Inhibition of monoamine oxidase activity after combined action of chlordimeform with the antidepressant nialamide. Kaloyanova F, et al. **Arch Environ Contam Toxicol** 1981;10(1):1-8

Subsensitivity of the beta-adrenergic receptor-linked adenylate cyclase system of rat pineal gland following repeated treatment with desmethylimipramine and nialamide. Moyer JA, et al. **Mol Pharmacol** 1981 Mar;19(2):187-93

NOREPINEPHRINE

Effects of adrenergic neuron and ganglion blockers on hemodynamics and plasma catecholamine levels after corticosteroids during hemorrhagic shock in the dog. Haglund U, et al. **Acta Anaesthesiol Scand** 1980 Dec;24(6):444-50

Further evidence of the dual role of noradrenaline in regulation of thyrotrophin secretion in male rats. Männistö PT, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):213-20

Thyroid hormone-catecholamine interrelationships during exposure to cold. Storm H, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):91-7

Immunohistochemical characterization of monoamine-containing neurons in the central nervous system by antibodies to serotonin and noradrenalin. A study in the rat and the lamprey (Lampetra fluviatilis). Steinbusch HW, et al. **Acta Histochem [Suppl] (Jena)** 1981;24:107-22

Neuropathological findings in autonomic nervous system of alimentary tract of rat after application of catecholamines. Jędrzejewska A, et al. **Acta Neuropathol [Suppl] (Berl)** 1981;7:273-5

Effect of prostaglandin synthesis inhibition on the central activity of noradrenaline in rats. Brus R, et al. **Acta Physiol Pol** 1981 Jan-Feb; 32(1):47-51

Urinary catecholamine excretion and plasma dopamine-beta-hydroxylase activity during mental work performed in some periods of menstrual cycle in women. Wasilewska E, et al. **Acta Physiol Pol** 1980; 31(6):647-51

Autoinhibition versus transsynaptic control of noradrenaline secretion in the rabbit kidney. Hedqvist P. **Acta Physiol Scand** 1980 Dec; 110(4):441-3

Catecholamines and monoamine oxidase activity in anxiety. Mathew RJ, et al. **Acta Psychiatr Scand** 1981 Mar;63(3):245-52

Controlled cross-over study of a 5-HT uptake inhibiting and an NA uptake inhibiting antidepressant. Aberg A. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):244-55

Specific norepinephrine and serotonin uptake inhibitors in man: a crossover study with pharmacokinetic, biochemical, neuroendocrine and behavioral parameters. Potter WZ, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):152-65

Serotonin and noradrenaline uptake inhibitors in the treatment of depression--relationship to 5-HIAA in spinal fluid. Träskman-Bendz L, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):209-18

Glomerular architectural changes after a two-hour infusion of norepinephrine. Bulger RE, et al. **Am J Anat** 1980 Dec; 159(4):379-84

Changes in cardiovascular and renal function during catecholamine infusions in developing swine. Buckley NM, et al. **Am J Physiol** 1981 Apr;240(4):F276-81

Cardiac cyclic nucleotides and norepinephrine during neural sympathetic stimulation. Pindok MT, et al. **Am J Physiol** 1981 Apr; 240(4):H630-5

Adrenergically induced renin release in conscious indomethacin-treated dogs and rats. Seymour AA, et al. **Am J Physiol** 1981 Jun; 240(6):F515-21

Contractility of vascular smooth muscle: maximum ability to contract in response to a stimulus. Skaug N, et al. **Am J Physiol** 1981 Jun; 240(6):H971-9

Increased activity of carotid sinus baroreceptors by sympathetic stimulation and norepinephrine. Tomomatsu E, et al. **Am J Physiol** 1981 Apr;240(4):H650-8

Alternation by histamine receptor agonists of the release of adrenergic transmitter in the isolated perfused rabbit kidney. Ercan ZS, et al. **Arch Int Pharmacodyn Ther** 1981 Feb;249(2):203-12

Antinoradrenergic activity of thymoxamine and its metabolites in rats. Roquebert J, et al. **Arch Int Pharmacodyn Ther** 1981 Jan; 249(1):12-25

Effect of SQ 14225 and SQ 20881 on the norepinephrine contents of the central nervous system. Dominguez AE, et al. **Arch Int Physiol Biochim** 1981 Feb;89(1):89-90

A comparative study on the retention of 3H lignocaine and 3H prilocaine in the presence of various vasoconstrictors. Almasi W, et al. **Aust Dent J** 1980 Dec;25(6):316-8

Alterations in brain norepinephrine metabolism and behavior induced by environmental stimuli previously paired with inescapable shock. Cassens G, et al. **Behav Brain Res** 1981 May;2(3):387-407

Induction of phosphoenolpyruvate carboxykinase by sympathetic agents in primary cultures of adult rat hepatocytes. Wölfle D, et al. **Biochem Biophys Res Commun** 1981 Feb 27;98(4):1084-90

Changes in fatty acyl chain composition of rat heart phospholipids induced by noradrenaline. Emilsson A, et al. **Biochim Biophys Acta** 1981 Apr 23;664(1):82-8

Solubilization and reconstitution of the adenosine 5'-triphosphate dependent noradrenaline uptake system of bovine chromaffin granule membrane. Isambert MF, et al. **Biochimie** 1981 Mar;63(3):211-9

Vesicular noradrenaline stores in peripheral nerves of the rat and their modification by tranylcypromine. Fillenz M, et al. **Br J Pharmacol** 1981 Jun;73(2):401-4

The role of calcium in the effects of noradrenaline and phenoxybenzamine on adrenergic transmitter release from atria: no support for negative feedback of release. Kalsner S. **Br J Pharmacol** 1981 Jun; 73(2):363-71

Effects of nerve stimulation and of administration of noradrenaline or potassium chloride upon the release of prostaglandins, I2, E2, and F2 alpha from te perfused mesenteric arterial bed of the rabbit. Pipili E, et al. **Br J Pharmacol** 1981 Jan;72(1):89-93

Noradrenaline augments tetanic potentiation of transmitter release by a calcium dependent process. Bergman H, et al. **Brain Res** 1981 Jun 9; 214(1):200-4

Evidence that the noradrenergic coerulospinal projection decussates at the spinal level. Commissiong JW. **Brain Res** 1981 May 11; 212(1):145-51

Regional changes in brain catecholamine turnover in the rat during performance on fixed ratio and variable interval schedules of reinforcement. Heffner TG, et al. **Brain Res** 1981 Jun 9; 214(1):215-8

Regional differences in catecholamine formation and metabolism in the rat spinal cord. Karoum F, et al. **Brain Res** 1981 May 18; 212(2):361-6

Destruction of noradrenergic cell bodies by intracerebral 6-hydroxydopamine in the newborn rat. Lanfumey L, et al. **Brain Res** 1981 Jun 15;214(2):445-50

Mechanisms of norepinephrine actions on hippocampal pyramidal cells in vitro. Langmoen IA, et al. **Brain Res** 1981 Mar 16;208(2):349-62

Noradrenergic responses in rat hippocampus: evidence for medication by alpha and beta receptors in the in vitro slice. Mueller AL, et al. **Brain Res** 1981 Jun 9;214(1):113-26

Increased concentration and accelerated synaptosomal uptake of noradrenaline in the central nervous tissues of neonatally hemispherectomized adult rats. Toyama M, et al. **Brain Res** 1981 Mar 16;208(2):447-50

Antagonism of the inhibitory effect of the polychlorinated biphenyl preparation, aroclor 1242, on color changes of the fiddler crab, Uca pugilator, by norepinephrine and drugs affecting noradrenergic neurotransmission. Hanumante MM, et al. **Bull Environ Contam Toxicol** 1981 Apr;26(4):479-84

Noradrenaline-induced calorigenesis in warm- and cold-acclimated rats: relations between concentration of noradrenaline in arterial plasma, blood flow to differently located masses of brown adipose tissue, and calorigenic response. Foster DO, et al. **Can J Physiol Pharmacol** 1980 Aug;58(8):915-24

Evidence against noradrenergic regulation of vasodilation in rat brown adipose tissue. Foster DO, et al. **Can J Physiol Pharmacol** 1980 Dec; 58(12):1418-25

Different influences of two types of diets commonly used for rats on a series of parameters related to the metabolism of central serotonin and noradrenaline. Héroux O, et al. **Can J Physiol Pharmacol** 1981 Feb; 59(2):108-12

Release of noradrenaline from the rat tail artery induced by inhibition of the sodium pump in calcium-free solution. Palatý V. **Can J Physiol Pharmacol** 1981 Apr;59(4):347-50

The load clamp analysis of mammalian heart contraction in the presence of noradrenaline. Rosenshtraukh LV, et al. **Can J Physiol Pharmacol** 1980 Dec;58(12):1504-8

Correlations between hemodynamic parameters of the liver and norepinephrine release upon hepatic nerve stimulation in the dog. Yamaguchi N, et al. **Can J Physiol Pharmacol** 1980 Nov; 58(11):1347-55

Microspectrofluorometric study of monoamines in the auricle of the heart of Protopterus aethiopicus. Scheuermann DW, et al. **Cell Tissue Res** 1981;217(2):443-9

Effects of norepinephrine and dibutyryl adenosine 3',5'-cyclic monophosphate on the ultrastructure of pineal cells in monolayer culture. Steinberg V, et al. **Cell Tissue Res** 1981;216(1):181-91

Lack of effect of intravenous LHRH on plasma noradrenaline in man. Jürgensen HJ, et al. **Clin Endocrinol (Oxf)** 1980 Sep;13(3):249-52

Age-dependence of noradrenaline kinetics in normal subjects. Esler M, et al. **Clin Sci** 1981 Feb;60(2):217-9

Mianserin: direct activation of brain norepinephrine neurons by blocking alpha 2-receptors. Engberg G, et al. **Commun Psychopharmacol** 1980; 4(3):233-9

Effect of piribedil (ET-495) on plasma norepinephrine: relationship to antidepressant response. Reus VI, et al. **Commun Psychopharmacol** 1980; 4(3):207-13

Plasma norepinephrine, epinephrine, and dopamine concentrations in maternal and fetal sheep during spontaneous parturition and in premature sheep during cortisol-induced parturition. Eliot RJ, et al. **Endocrinology** 1981 May;108(5):1678-82

The role of central adrenoreceptors in the control of vasopressin release and blood pressure. Kimura T, et al. **Endocrinology** 1981 May; 108(5):1829-36

Negative feedback effects of progesterone correlated with changes in hypothalamic norepinephrine and dopamine turnover rates, median eminence luteinizing hormone-releasing hormone, and peripheral plasma gonadotropins. Rance N, et al. **Endocrinology** 1981 Jun; 108(6):2194-9

The lateral and medial median eminence: distribution of dopamine, norepinephrine, and luteinizing hormone-releasing hormone and the effect of prolactin on catecholamine turnover. Selmanoff M. **Endocrinology** 1981 May;108(5):1716-22

Morphine: dual effects on plasma catecholamines. Taborsky GJ Jr, et al. **Endocrinology** 1981 Jul;109(1):319-21

Effects of estradiol and progesterone on catecholamine turnover rates in discrete hypothalamic regions in ovariectomized rats. Wise PM, et al. **Endocrinology** 1981 Jun;108(6):2186-93

Reversal of noradrenaline denervation-induced increase of beta-adrenoreceptor binding in rat neocortex by noradrenaline infusion. Biswas B, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):341-6

Calcium-sensitive accumulation of norepinephrine in rat cerebral cortex. Burrows GH, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):301-12

Supersensitivity of central noradrenergic presynaptic autoreceptors following chronic treatment with the antidepressant mianserin. Cerrito F, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):425-6

Neonatal intraspinal 6-hydroxydopamine: depletion of norepinephrine but not dopamine. Ings R, et al. **Eur J Pharmacol** 1981 Apr 9; 70(4):577-83

'High affinity' binding of [3H]desipramine to rat cerebral cortex: relationship to tricyclic antidepressant-induced inhibition of norepinephrine uptake. Rehavi M, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):597-9

Comparison of two alpha-noradrenergic agonists (clonidine and guanfacine) on norepinephrine turnover in the cortex of rats during morphine abstinence. Zigun JR, et al. **Eur J Pharmacol** 1981 Apr 9; 70(4):565-70

Postsynaptic inhibitory actions of catecholamines and opioid peptides in the bed nucleus of the stria terminalis. Sawada S, et al. **Exp Brain Res** 1981;41(3-4):264-70

Degeneration of nerve terminals in cats following systemic epinephrine: depletion of tissue norepinephrine correlated with ultrastructural changes. Flach AJ, et al. **Exp Eye Res** 1981 Apr;32(4):389-94

Effect of monoamines on firing rate and thermal sensitivity of neurons in the preoptic area of awake rabbits. Gordon CJ, et al. **Exp Neurol** 1981 May;72(2):352-65

Electro-osmotic and iontophoretic release of noradrenaline from micropipettes. Bevan P, et al. **Experientia** 1981 Mar 15;37(3):296-7

Differential sensitivity of the two phases of ear artery contraction to intimal and adventitial norepinephrine. McCalden TA, et al. **Experientia** 1981 Mar 15;37(3):268-9

Vasoconstrictor effects of tyramine and noradrenaline on goat brain vessels. Marin J, et al. **Gen Pharmacol** 1981;12(3):187-91

Catecholamine turnover in rat cerebral cortex and caudate following repeated treatment with dihydroergotoxine. Cvejić V, et al. **Gerontology** 1981;27(1-2):7-12

The detection by x-ray microanalysis of noradrenaline in sympathetic nerve terminals of the rat vas deferens. Santer RM, et al. **Histochemistry** 1981;71(1):155-60

Compartmentation of adenine nucleotides in the isolated working guinea pig heart stimulated by noradrenaline. Soboll S, et al. **Hoppe Seylers Z Physiol Chem** 1981 Feb;362(2):125-32

Circadian rhythm and hormonal sensitivity of lipoprotein lipase activity in cold acclimated rats. Goubern M, et al. **Horm Metab Res** 1981 Feb;

13(2):73–7
Binding of noradrenaline to bovine serum albumin. Farre ER, et al. **Int J Nucl Med Biol** 1981;8(1):65–75
Myocardial norepinephrine turnover during induced hypothermia and rewarming. Jones SB. **J Appl Physiol** 1981 May;50(5):962–6
Amine transport in chromaffin granule ghosts. pH dependence implies cationic form is translocated. Knoth J, et al. **J Biol Chem** 1981 Jul 10; 256(13):6541–3
Novel post-column derivatization method for the fluorimetric determination of norepinephrine and epinephrine. Nimura N, et al. **J Chromatogr** 1980 Dec 12;221(2):249–55
Age-related elevation of plasma catecholamine concentration and reduced responsiveness of lymphocyte adenylate cyclase. Krall JF, et al. **J Clin Endocrinol Metab** 1981 May;52(5):863–7
3-Methoxytyramine and normetanephrine as indicators of dopamine and noradrenaline release in mouse brain in vivo. Kehr W. **J Neural Transm** 1981;50(2–4):165–78
Individually reared rats: alteration in noradrenergic brain functions. Kraeuchi K, et al. **J Neural Transm** 1981;50(2–4):103–12
The functional role of the noradrenergic neurons in the thermoregulatory circuits in mice. Schelkunov EL, et al. **J Neural Transm** 1981; 50(2–4):113–37
Reduction of Vanadate by ascorbic acid and noradrenaline in synaptosomes. Adám-Vizi V, et al. **J Neurochem** 1981 May; 36(5):1616–20
Conversion of 3, 4-dihydroxyphenylalanine and deuterated 3, 4-dihydroxyphenylalanine to alcoholic metabolites of catecholamines in rat brain. Edwards DJ, et al. **J Neurochem** 1981 May; 36(5):1641–7
Biochemical and histochemical studies on catecholamines in bullfrog spinal ganglia. Kojima H, et al. **J Neurochem** 1981 Jun;36(6):2106–9
The inhibition by flunarizine of the norepinephrine-evoked contraction and calcium influx in rat aorta and mesenteric arteries. Godfraind T, et al. **J Pharmacol Exp Ther** 1981 May;217(2):510–5
Thyrotropin releasing factor: a putative CNS regulator of the autonomic nervous system. Brown MR. **Life Sci** 1981 Apr 13–20; 28(15–16):1789–95
I. Catecholamines in developing rat lung. Gardey-Levassort C, et al. **Life Sci** 1981 Jan 26;28(4):331–7
Passive avoidance performance correlates with catecholamine turnover in discrete limbic brain regions. Kovács GL, et al. **Life Sci** 1981 Mar 9;28(10):1109–16
Dopamine and norepinephrine uptake and metabolism by astroglial cells in culture. Pelton EW 2d, et al. **Life Sci** 1981 Apr 6;28(14):1655–63
Action of colchicine on cholinergic and adrenergic mechanisms in guinea pig vas deferens. Takeyasu K, et al. **Life Sci** 1981 Feb 23; 28(8):851–60
Stimulatory effect of somatostatin on norepinephrine release from rat brain cortex slices. Tsujimoto A, et al. **Life Sci** 1981 Feb 23;28(8):903–10
Urinary excretion of radiolabelled norepinephrine after release from renal sympathetic nerves. Willis LR, et al. **Life Sci** 1980 Dec 22–29; 27(25–26):2541–6
Distinct regulations by calcium of cyclic GMP levels and catecholamine secretion in isolated bovine adrenal chromaffin cells. Lemaire S, et al. **Metabolism** 1981 May;30(5):462–8
The effect of phencyclidine on noradrenaline uptake by bovine chromaffin granules. Amir A, et al. **Monogr Neural Sci** 1980;7:129–37
The participation of cyclic nucleotides and protein kinase in the regulation of norepinephrine synthesis and release during nerve stimulation. Weiner N. **Monogr Neural Sci** 1980;7:146–60
The inhibition by (+/–)-propranolol of the positive inotropic effects of (+/–)-isoprenaline and (–)-noradrenaline. Competitive antagonism and saturable uptake. Ebner F. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):96–107
GABA facilitation by noradrenaline shows supersensitivity in cerebellum after 6-hydroxydopamine. Moises HC, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980;315(1):37–46
Monoamine uptake into synaptosomes from various regions of rat brain following lithium administration and withdrawal. Ahluwalia P, et al. **Neuropharmacology** 1981 May;20(5):483–7
Effects of phenytoin on mouse cerebellar 5-hydroxytryptamine and norepinephrine. Fry BW, et al. **Neuropharmacology** 1981 Jun; 20(6):623–5
Modulatory interactions between norepinephrine and taurine, beta-alanine, gamma-aminobutyric acid and muscimol, applied iontophoretically to cerebellar Purkinje cells. Yeh HH, et al. **Neuropharmacology** 1981 Jun;20(6):549–60
Influence of castration and testosterone propionate on [3H]noradrenaline metabolism in various structures of male rat brain. Bekhtereva EP. **Neurosci Behav Physiol** 1980 Nov–Dec;10(6):471–3
Noradrenaline content correlated to matrix density in small noradrenergic vesicles from rat seminal ducts. Fried G, et al. **Neuroscience** 1981; 6(4):787–800
Norepinephrine-containing terminals in kitten visual cortex: laminar distribution and ultrastructure. Itakura T, et al. **Neuroscience** 1981; 6(2):159–75
Fine structure of rat cerebellar noradrenaline terminals as visualized by potassium permanganate 'in situ perfusion' fixation method. Kimoto Y, et al. **Neuroscience** 1981;6(1):47–58
Involvement of serotonin and catecholamine metabolism in cats trained to perform a delayed response task. Va[illegible] L, et al. **Neuroscience** 1981; 6(2):189–94
Cholecystokinin acts on the hypothalamic 'noradrenergic system' involved in feeding. McCaleb ML, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):47–9
Influence of noradrenaline on blood flow to brown adipose tissue in rats exhibiting diet-induced thermogenesis. Rothwell NJ, et al. **Pflugers Arch** 1981 Mar;389(3):237–42
Regional responses of rat brain noradrenergic neurones to acute intense stress. Nakagawa R, et al. **Pharmacol Biochem Behav** 1981 May; 14(5):729–32
Mechanism of stress-induced subsensitivity to norepinephrine. Stone EA. **Pharmacol Biochem Behav** 1981 May;14(5):719–23
Noradrenergic transmission in depression: under- or overfunction? Waldmeier PC. **Pharmacopsychiatria** 1981 Jan;14(1 Suppl):3–9
Septal lesions and avoidance behavior: genetic, neurochemical and behavioral considerations. Donovick PJ, et al. **Physiol Behav** 1981 Mar; 26(3):495–507
The hyperactive child syndrome: peripheral sympathetic nervous system function and the effect of d-amphetamine. Mikkelsen E, et al. **Psychiatry Res** 1981 Apr;4(2):157–69
The specific activity of platelet monoamine oxidase varies with platelet count during severe exercise and noradrenaline infusion. Gawel MJ, et al. **Psychopharmacology (Berlin)** 1981;72(3):275–7
Increased brain serotonergic and noradrenergic activity after repeated systemic administration of the beta-2 adrenoceptor agonist salbutamol, a putative antidepressant drug. Hallberg H, et al. **Psychopharmacology (Berlin)** 1981;73(3):201–4
Electrophysiologic interactions of antipsychotic drugs with central noradrenergic pathways. Marwaha J, et al. **Psychopharmacology (Berlin)** 1981;73(2):126–33
Two pools of amines in synaptic vesicles of rat pineal nerves. Pellegrino de Iraldi A, et al. **Rev Can Biol** 1981 Mar;40(1):101–9
Influence of sympathetic tonus and plasma noradrenaline on urethral pressure. Nordling J, et al. **Scand J Urol Nephrol** 1981;15(1):1–6
[Short-term submaximum work and its effect on plasma noradrenaline levels (author's transl)] Stejskal P. **Cas Lek Cesk** 1981 Feb 26; 120(8):218–23 (Eng. Abstr.) (Cze)
[Comparative pharmacology of adrenaline and noradrenaline] Martin C, et al. **Ann Anesthesiol Fr** 1981;22(1):85–96 (16 ref.) (Fre)
[Effect of social isolation on the transmitter sensitivity of striatal and hippocampal neurons of the rat] Oehler J, et al. **Acta Biol Med Ger** 1980;39(10):1089–93 (Eng. Abstr.) (Ger)
[Development of biological psychiatric depression research (author's transl)] Matussek N. **MMW** 1981 May 8;123(19):793–4 (Eng. Abstr.) (Ger)
[Modulation of the effect of morphine on the isolated guinea pig intestine by noradrenaline and serotonin] Sarto G. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):394–400 (Eng. Abstr.) (Ita)
[Studies on the mechanism of the hypertropic action of hydrocortisone on the secretory tubules of the mouse submandibular glands. 3) Effect of hydrocortisone acetate on the noradrenaline stimulation to submandibular glands (author's transl)] Maruyama S, et al. **Josai Shika Daigaku Kiyo** 1980;1(9):29–34 (Eng. Abstr.) (Jpn)
[Effect of adrenaline, noradrenaline and acetylcholine on rabbit and human uterine activity in vivo (author's transl)] Sakoda H. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 Jun;32(6):697–705 (Eng. Abstr.) (Jpn)
[Changes in the morphofunctional status of the capillary system of the cerebral cortex in cats exposed to adrenergic stimulation while prostaglandin biosynthesis is inhibited] Gabrielian ES, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):173–5 (Eng. Abstr.) (Rus)
[Noradrenaline as a RNA and Na K ATPase biosynthesis regulator in the neurons] Elaev NR. **Probl Endokrinol (Mosk)** 1981 Jan–Feb; 27(1):58–62 (Eng. Abstr.) (Rus)
[Effect of Arzni carbonate mineral baths on labeled noradrenaline uptake by myocardial sections and the activity of mitochondrial monoamine oxidase] Mirzoian SA, et al. **Vopr Kurortol Fizioter Lech Fiz Kult** 1981 Mar–Apr;(2):42–5 (Rus)

NORMETANEPHRINE

A simple chromatographic technique for the estimation of urinary levels of normetadrenaline and metadrenaline. Hanson P, et al. **Clin Biochem** 1980 Dec;13(6):262–5
Analysis of urinary metanephrines by reversed-phase high-performance liquid chromatography and electrochemical detection. Bertani-Dziedzic LM, et al. **Clin Chim Acta** 1981 Feb 19;110(1):1–8
3-Methoxytyramine and normetanephrine as indicators of dopamine and noradrenaline release in mouse brain in vivo. Kehr W. **J Neural Transm** 1981;50(2–4):165–78

NORTRIPTYLINE

Saliva secretion following long-term antidepressant treatment with nortriptyline controlled by plasma levels. Bertram U, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):357–63

Effect of alcohol consumption and cigarette smoking on antidepressant levels of depressed patients. Linnoila M, et al. **Am J Psychiatry** 1981 Jun;138(6):841–2

Pharmacokinetics of nortriptyline in elderly volunteers. Turbott J, et al. **Commun Psychopharmacol** 1980;4(3):225–31

Excretion of nortriptyline into saliva. Virtanen R. **Int J Clin Pharmacol Ther Toxicol** 1981 Feb;19(2):78–81

Slow hydroxylation of nortriptyline and concomitant poor debrisoquine hydroxylation: clinical implications [letter] Bertilsson L, et al. **Lancet** 1981 Mar 7;1(8219):560–1

Nortriptyline and pituitary-thyroid function in affective disorder. Nordgren L, et al. **Pharmacopsychiatria** 1981 Mar;14(2):61–5

OBSESSIVE-COMPULSIVE DISORDER

Review of behavioral psychotherapy, I: Obsessive-compulsive disorders. Marks IM. **Am J Psychiatry** 1981 May;138(5):584–92 (45 ref.)

Psychotropic drugs and behaviour therapy. Stern R. **Practitioner** 1981 Jan;225(1351):21–5

OXAZEPAM

Oxazepam in the treatment of anxiety associated with depression: results of treatment in 1600 cases (Studies in depression, VI). Bailey HR, et al. **Curr Med Res Opin** 1981;7(3):156–63

Oxazepam esters. 3. Intrinsic activity, selectivity, and prodrug effect. Maksay G, et al. **J Med Chem** 1981 May;24(5):499–502

[The influence of oxazepam and diazepam on the sexual behaviour and level of GABA biogenic amines in a male rat's brain (author's transl)] Borzęcki Z, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979; 34:371–6 (Eng. Abstr.) **(Pol)**

PARANOID DISORDERS

An obligation to treat vs. a right to refuse. Davis AJ. **Am J Nurs** 1981 Jul;81(7):1370

PARASYMPATHOMIMETICS

Role of cyclic GMP in cholinergic activation of Na-K pump in duck salt gland. Stewart DJ, et al. **Am J Physiol** 1981 May; 240(5):C207–14

Actions of various muscarinic agonists on membrane potential, potassium efflux, and contraction of longitudinal muscle of guinea-pig intestine. Bolton TB, et al. **Br J Pharmacol** 1981 Feb;72(2):319–34

Cholinergic effect of 4-aminopyridine and adrenergic effect of 4-methyl-2-aminopyridine in cardiac muscle. Glover WE. **Eur J Pharmacol** 1981 Apr 24;71(1):21–31

Molecular requirements of the active sites of the cholinergic receptors. XVI – Synthesis and cholinergic activity of 2- or 5-alkyl or 5-phenyl-4-methyl-3-oxo-1-dimethylaminomethylcyclopentane methiodide. Pigini M, et al. **Farmaco [Sci]** 1981 Feb;36(2):152–8

Conformational analysis of the reverse ester of acetylcholine, cholinergic potency, and cholinergic models. Reed KW, et al. **Gen Pharmacol** 1981; 12(3):177–85

Fluorescence and N.M.R. studies of the binding of cholinergic fluorescent probes to horse serum cholinesterase. Narayanan R, et al. **Int J Pept Protein Res** 1981 Feb;17(2):170–80

Molecular requirements of the active site of cholinergic receptors XV: Synthesis and biological activity of 2,3-dehydrodeoxamuscarone and 2,3-dehydrodeoxamuscarines. Angeli P, et al. **J Pharm Sci** 1981 May; 70(5):489–92

Pre- and postsynaptic effects of muscarinic agonists in the guinea-pig ileum. Kilbinger H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):259–66

Interaction of morphine with the cholinergic system on prolactin release. Fanjul LF, et al. **Proc Soc Exp Biol Med** 1981 Apr;166(4):542–5

[Effects of parasympathomimetic and sympathomimetic drugs on the sublingual glands of rats] Abe K, et al. **Gifu Shika Gakkai Zasshi** 1980 Jun;8(1):36–52 (Eng. Abstr.) **(Jpn)**

PARGYLINE

Effects of pargyline and diethyldithiocarbamate in vivo treatment on aldehyde dehydrogenase activities of submitochondrial fractions. Nakanishi S, et al. **Arch Toxicol** 1980 Dec;46(3–4):241–8

Studies on the pargyline-binding site of different types of monoamine oxidase. Yu PH. **Can J Biochem** 1981 Jan;59(1):30–7

PEMOLINE

Reversed-phase high-performance liquid chromatographic detection of pemoline in doping control. Cartoni GP, et al. **J Chromatogr** 1980 Dec 5;202(1):131–3

Analysis of pemoline in serum by high performance liquid chromatography: clinical application to optimize treatment of hyperactive children. Tomkins CP, et al. **Ther Drug Monit** 1980; 2(3):255–60

[Effect of a combined geriatric preparation on serum proteins and liver tests (author's transl)] Kocián J, et al. **Cesk Gastroenterol Vyz** 1981 Mar; 35(2):49–53 (Eng. Abstr.) **(Cze)**

PENTOBARBITAL

Selective effects of barbiturate and amphetamine on information processing and response execution. Frowein HW. **Acta Psychol (Amst)** 1981 Feb;47(2):105–15

Induction of hyperphagia in rats by intracerebroventricular infusion of sodium pentobarbital. A method for testing anorexigenic compounds. Kaufmann SH, et al. **Arzneimittelforsch** 1981;31(2):335–7

Barbiturate enhancement of GABA-mediated inhibition and activation of chloride ion conductance: correlation with anticonvulsant and anesthetic actions. Schulz DW, et al. **Brain Res** 1981 Mar 23; 209(1):177–88

The inhibition and potentiation of procarbazine on hepatic mixed-function oxidases in phenobarbital tolerant and nontolerant mice. Onoda K, et al. **Drug Chem Toxicol** 1980;3(2):185–200

The effect of pentobarbital on central somatosensory conduction time in the rat. Shaw NA, et al. **Electroencephalogr Clin Neurophysiol** 1981 Jun;51(6):674–7

Regulation of the second surge of follicle-stimulating hormone; effects of antiluteinizing hormone-releasing hormone serum and pentobarbital. Hasegawa Y, et al. **Endocrinology** 1981 Jul;109(1):130–5

Effects of combinations of phencyclidine and pentobarbital on fixed-interval performance in rhesus monkeys. Woolverton WL, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):611–8

Pentobarbitone slows the dissociation of GABA from rat brain synaptosomal binding sites. Willow M, et al. **Neurosci Lett** 1981 Apr 9;23(1):71–4

Effect of pentobarbital on thalamo- and hippocampocortical processes in rats. Kolinová M, et al. **Physiol Bohemoslov** 1981;30(2):139–48

[Effect of the administration of sodium pentobarbital on tolerance to acute hypoxia in albino rats] Quatrini U, et al. **Boll Soc Ital Biol Sper** 1981 Feb 15;57(3):333–9 **(Ita)**

PEPTIDES

An introduction to the immunocytochemical localization of neuropeptides and neurotransmitters. van Leeuwen FW. **Acta Histochem [Suppl] (Jena)** 1981;24:49–77 (162 ref.)

Specific colorimetric detection of o-diphenols and 3,4-dihydroxyphenylalanine-containing peptides. Waite JH, et al. **Anal Biochem** 1981 Feb;111(1):131–6

Thyrotropin-releasing hormone and a homologous peptide in the reproductive system of the female rat and pig. Pekary AE, et al. **Biochem Biophys Res Commun** 1981 Mar 16;99(1):73–80

Specific stimulation of steroidogenesis in rat adrenal zona glomerulosa cells by pituitary peptides. Vinson GP, et al. **Biochem Biophys Res Commun** 1981 Mar 16;99(1):65–72

Ordered conformation of polypeptides and proteins in acidic dodecyl sulfate solution. Wu CS, et al. **Biochemistry** 1981 Feb 3;20(3):566–70

The effects of substance P and related peptides on alpha-amylase release from rat parotid gland slices. Brown CL, et al. **Br J Pharmacol** 1981 Jun;73(2):517–23

Human insulin: study of safety and efficacy in man. Owens DR, et al. **Br Med J [Clin Res]** 1981 Apr 18;282(6272):1264–6

Immunocytochemical demonstration of peptidergic neurons in the central nervous system of the pond snail Lymnaea stagnalis with antisera raised to biologically active peptides of vertebrates. Schot LP, et al. **Cell Tissue Res** 1981;216(2):273–91

Microsuperfusion of neurointermediate lobes of Xenopus laevis: concomitant and coordinately controlled release of newly synthesized peptides. Martens GJ, et al. **Comp Biochem Physiol [C]** 1981; 69C(1):75–82

Neuropeptides: central nervous system effects on nutrient metabolism. Brown M. **Diabetologia** 1981 Mar;20 Suppl:299–304 (28 ref.)

The effect of somatostatin on bombesin-stimulated serum gastrin and gastric acid secretion in man. Jansen JB, et al. **Digestion** 1981; 21(4):193–7

Evidence for two different turnover pools of adrenocorticotropin, alpha-melanocyte-stimulating hormone, and endorphin-related peptides released by the frog pituitary neurointermediate lobe. Loh YP, et al. **Endocrinology** 1981 Jul;109(1):54–61

Heterogeneity of somatostatin-like peptides in rat brain, pancreas, and gastrointestinal tract. Trent DF, et al. **Endocrinology** 1981 Jun; 108(6):2033–8

Effects of somatostatin-14 and somatostatin-28 on bombesin-stimulated release of gastrin, insulin, and glucagon in the dog. Veyne N, et al. **Endocrinology** 1981 May;108(5):1843–7

Active chloride transport by the skin of a marine teleost is stimulated by urotensin I and inhibited by urotensin II. Marshall WS, et al. **Gen Comp Endocrinol** 1981 Apr;43(4):484-91

Isolation, structure and synthesis of a heptapeptide with in vitro ACTH-releasing activity from porcine hypothalamus. Chang RC, et al. **Horm Metab Res** 1981 Apr;13(4):228-32

Studies on protein semisynthesis. I. Formation of esters, hydrazides, and substituted hydrazides of peptides by the reverse reaction of trypsin. Yagisawa S. **J Biochem (Tokyo)** 1981 Feb;89(2):491-501

Characterization and determination of neuropeptides by high-performance liquid chromatography and radioimmunoassay. McDermott JR, et al. **J Chromatogr** 1981 Mar 13;222(3):371-9

Association of the transformation-specific protein pp60src with the membrane of an avian sarcoma virus. Bunte T, et al. **J Virol** 1981 Jun; 38(3):1034-47

Corticotropin/beta-endorphin immunoreactivity in rat mast cells. Peptide or protease? DiAugustine RP, et al. **Life Sci** 1980 Dec 22-29; 27(25-26):2663-8

Comparative study on the effect of morphine and the opioid-like peptides in the vas deferens of rodents: species and strain differences, evidence for multiple opiate receptors. Huidobro-Toro JP, et al. **Life Sci** 1981 Mar 23;28(12):1331-6

Bacterial peptides with C-terminal similarities to bovine neurotensin. Bhatnagar YM, et al. **Peptides (Fayetteville)** 1981 Spring;2(1):51-9

Immunochemical characterization of neurotensin-like peptides in chicken. Carraway R, et al. **Peptides (Fayetteville)** 1980 Summer;1(2):159-65

Feeding and selection of saccharin after injections of bombesin, LiCl, and NaCl. Kulkosky PJ, et al. **Peptides (Fayetteville)** 1981 Spring; 2(1):61-4

Failure of peptides (angiotensin, bradykinin, substance P, physalaemin, Met-enkephalin) to influence the cardiac action potential. Iven H, et al. **Pharmacology** 1980;21(6):403-6

Effects of hyperthermia on binding, internalization, and degradation of epidermal growth factor. Magun BE, et al. **Radiat Res** 1981 Apr; 86(1):133-46

Immunohistochemical evidence of gastro-entero-pancreatic neurohormonal peptides of vertebrate type in the nervous system of the larva of a dipteran insect, the hoverfly, Eristalis aeneus. El-Salhy M, et al. **Regul Pept** 1980 Dec;1(3):187-204

[Convergence and reciprocal coupling of hypothalamic monoaminergic and peptidergic neurons (author's transl)] Barry J. **Ann Endocrinol (Paris)** 1980 Nov-Dec;41(6):457-65 (Eng. Abstr.) **(Fre)**

[Biosynthesis of some hypothalamic neuropeptides. Identification of precursor forms (author's transl)] Camier M, et al. **Ann Endocrinol (Paris)** 1980 Nov-Dec;41(6):466-77 (37 ref.) (Eng. Abstr.) **(Fre)**

[In vitro study of the interaction between neuromediators and neuropeptides involved in hypothalamic neurosecretion control (author's transl)] Epelbaum J, et al. **Ann Endocrinol (Paris)** 1980 Nov-Dec;41(6):478-86 (35 ref.) (Eng. Abstr.) **(Fre)**

[The intragonadic cybernins (author's transl)] Franchimont P. **J Gynecol Obstet Biol Reprod (Paris)** 1980;9(8):825-34 (Eng. Abstr.) **(Fre)**

[Gut-brain peptides-structures and functions (author's transl)] Yanaihara N. **Horumon To Rinsho** 1980 Oct;28(10):1153-60 (34 ref.) **(Jpn)**

[Reactions of an identified edible snail neuron to application of peptides, mediators, prostaglandins, and cyclic nucleotides] Osipovskii SA, et al. **Neirofiziologiia** 1981;13(1):80-7 (Eng. Abstr.) **(Rus)**

PERPHENAZINE

Effects of bromocriptine and perphenazine on male accessory sex glands. I. The seminal vesicles. Krall A, et al. **Arch Androl** 1981 Jun; 6(4):295-300

Radioimmunoassay for perphenazine in human plasma. Midha KK, et al. **Br J Clin Pharmacol** 1981 Jan;11(1):85-8

PERSONALITY DISORDERS

Attitudes toward medication change among chronically impaired psychiatric patients. Lesser IM, et al. **Am J Psychiatry** 1981 Jun; 138(6):801-3

Current concepts in psychiatry: borderline personality disorder. Groves JE. **N Engl J Med** 1981 Jul 30;305(5):259-62

Interrelationship of hysteroid dysphoria and borderline personality disorder. Liebowitz MR, et al. **Psychiatr Clin North Am** 1981 Apr; 4(1):67-87

The interaction of psychopharmacology and psychoanalysis in the borderline patient. Snyder S. **Psychiatr Q** 1980 Winter;52(4):240-50 (51 ref.)

PHENCYCLIDINE

Withdrawal from chronic phencyclidine (PCP) dependence with desipramine. Tennant FS Jr, et al. **Am J Psychiatry** 1981 Jun; 138(6):845-7

Phencyclidine intoxication: clinical experience in 27 cases confirmed by urine assay. Barton CH, et al. **Ann Emerg Med** 1981 May; 10(5):243-6

Effect of chronic administration of phencyclidine on hepatic mixed-function oxidases in the mouse. Ho IK, et al. **Biochem Pharmacol** 1981 Mar 1;30(5):545-7

An improved method for the quantitation of phencyclidine (PCP) in biological samples utilizing nitrogen-detection gas chromatography. Miceli JN, et al. **J Anal Toxicol** 1981 Jan-Feb;5(1):2[illegible]-32

Analytical determination of purity of 1-piperidinocyclohexanecarbonitrile and its hydrobromide salt. Soine WH. **J Pharm Sci** 1981 Jan; 70(1):106-8

The effect of phencyclidine on the turnover rate of acetylcholine in various regions of rat brain. Murray TF, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):733-7

Effects of N-substituted analogs and metabolites of phencyclidine on avoidance behavior in the rat. Shannon HE, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):55-62

Effects of combinations of phencyclidine and pentobarbital on fixed-interval performance in rhesus monkeys. Woolverton WL, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):611-8

Interactions of tricyclic antidepressants with a synaptic ion channel. Aronstam RS. **Life Sci** 1981 Jan 5;28(1):59-64

The identification of a new metabolite of phencyclidine. Cho AK, et al. **Life Sci** 1981 Mar 2;28(9):1075-9

The effect of phencyclidine on dopamine metabolism in the mouse brain. Johnson KM, et al. **Life Sci** 1981 Jan 26;28(4):361-9

Disposition of [3H] phencyclidine in the rat after single and multiple doses. Misra AL, et al. **Life Sci** 1980 Dec 22-29;27(25-26):2501-8

The effect of phencyclidine on noradrenaline uptake by bovine chromaffin granules. Amir A, et al. **Monogr Neural Sci** 1980;7:129-37

Phencyclidine inhibition of cerebellar Purkinje neurons. Marwaha J, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(34):187-92

Differential electrophysiological and behavioral responses to optically active derivatives of phencyclidine. Marwaha J, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Jan;315(3):203-9

[3H]Phencyclidine: a probe for the ionic channel of the nicotinic receptor. Eldefrawi ME, et al. **Proc Natl Acad Sci USA** 1980 Dec; 77(12):7458-62

Metabolic disposition and irreversible binding of phencyclidine in rats. Law FC. **Toxicol Appl Pharmacol** 1981 Feb;57(2):263-72

PHENCYCLIDINE ABUSE

Phencyclidine intoxication: clinical experience in 27 cases confirmed by urine assay. Barton CH, et al. **Ann Emerg Med** 1981 May; 10(5):243-6

Analytical determination of purity of 1-piperidinocyclohexanecarbonitrile and its hydrobromide salt. Soine WH. **J Pharm Sci** 1981 Jan; 70(1):106-8

PHENELZINE

Phenelzine and exposure in the treatment of phobias. Solyom C, et al. **Biol Psychiatry** 1981 Mar;16(3):239-47

Determination of phenelzine in human plasma with gas chromatography-mass spectrometry using an isotope labeled internal standard. Jindal SP, et al. **J Chromatogr** 1980 Dec 12;221(2):301-8

Agoraphobia: the 'what if' syndrome. Fier M. **J Med Soc NJ** 1981 Apr; 78(4):286-8

Relationship between response to phenelzine and MAO inhibition in a clinical trial of phenelzine, amitriptyline and placebo. Raft D, et al. **Neuropsychobiology** 1981;7(3):122-6

Effects of phenelzine and amitriptyline on depression [proceedings] Paykel ES, et al. **Psychopharmacol Bull** 1981 Jan;17(1):104-6

PHENETHYLAMINES

Type B monoamine oxidase activities toward beta-phenylethylamine in discrete hypothalamic and circumventricular nuclei of the rat. Kim JS, et al. **Biochem Pharmacol** 1981 Apr;30(8):893-5

Phenylethylamine effects on dopamine synthesis. Structure-activity relationships. Patrick RL. **Biochem Pharmacol** 1981 Jan 15; 30(2):141-6

Effect of hyperoxia on uptake and metabolism of 5-hydroxytryptamine and beta-phenylethylamine in rat lung: a sex difference. Ben-Harari RR, et al. **Br J Pharmacol** 1981 Jun;73(2):461-6

Quantitation of biologically important primary amines as their isothiocyanate derivatives by gas chromatography using nitrogen detector and validation by selected ion monitoring. Narasimhachari N, et al. **Clin Chim Acta** 1981 Mar 5;110(2-3):235-43

Toxicological analysis of phenylethylamines by high performance reversed-phase ion-pair partition thin-layer and liquid chromatographies. Verbiese-Genard N, et al. **Clin Toxicol** 1981; 18(4):391-400

Preferential blockade of postsynaptic alpha-adrenoceptors by BE 2254. Göthert M, et al. **Eur J Pharmacol** 1981 Mar 5;70(1):35-42

Secoverine selectively antagonizes muscarinic effects in various in vivo preparations. Zwagemakers JM, et al. **Eur J Pharmacol** 1981 Apr 24; 71(1):165-8

Radical formation in single crystals of aromatic amines and radical transformation by light. Karsten W, et al. **Int J Radiat Biol** 1981 Mar; 39(3):235-52

Physiologic effects and plasma kinetics of phenylethanolamine and its N-methyl homolog in the dog. Shannon HE, et al. **J Pharmacol Exp Ther** 1981 May;217(2):379-85

Substituted phenethylamines and anorexia. Duhault J, et al. **Prog Neuropsychopharmacol** 1980;4(4-5):341-9

Is the failure of (-)deprenyl, a selective monoamine oxidase B inhibitor, to alleviate depression related to freedom from the cheese effect? Mendis N, et al. **Psychopharmacology (Berlin)** 1981;73(1):87-90

[Release of norfenefrine from sustained-release formulations by an in vitro dissolution model. Simulation of 'drug levels' by calculation using pharmacokinetical constants and comparison with in vivo course of action (author's transl)] Laven R, et al. **Arzneimittelforsch** 1981; 31(2):353-6 (Eng. Abstr.) (Ger)

[Comparison of the tocolytic efficacy of hexoprenaline and ritodrine in prostaglandin-induced labor] Brabec W, et al. **Gynaekol Rundsch** 1980 Jun;20 Suppl 2:230-4 (Ger)

[Mechanism of inhibition by chlorgyline and deprenyl of tyramine deamination by mitochondrial monoamine oxidase of rat liver] Deverina IS. **Biokhimiia** 1980 Oct;45(10):1897-908 (Eng. Abstr.) (Rus)

PHENMETRAZINE

Correction of drug names [letter] Hamer R. **Ann Emerg Med** 1981 Jul; 10(7):395

A study of phenmetrazine (Preludin) abuse. Chambers CD, et al. **Chem Depend** 1980;4(1-2):101-11

PHENOBARBITAL

Influence of phenobarbital, chlorpromazine, progesterone and phenylbutazone on the biliary cholesterol excretion in rats. Barth A, et al. **Acta Biol Med Ger** 1980;39(11-12):1217-26

Serum digoxin concentrations in dogs before, during, and after concomitant treatment with phenobarbital. Pedersoli WM, et al. **Am J Vet Res** 1980 Oct;41(10):1639-42

Serum concentrations of primidone and its metabolites, phenylethylmalonamide and phenobarbital, in the dog. Yeary RA. **Am J Vet Res** 1980 Oct;41(10):1643-5

Low blood levels of phenobarbital due to poor gastrointestinal solubility of phenobarbital tablets [letter] Alvarez N, et al. **Ann Neurol** 1981 Mar; 9(3):309-10

Treatment of massive phenobarbital overdose with dopamine diuresis. Costello JB, et al. **Arch Intern Med** 1981 Jun;141(7):938-40

Alterations in rabbit liver protein synthesis as a result of phenobarbital treatment. DiLella AG, et al. **Biochem Biophys Res Commun** 1981 Feb 12;98(3):628-34

Induction of translationally active rat liver glutathione S-transferase B messenger RNA by phenobarbital. Pickett CB, et al. **Biochem Biophys Res Commun** 1981 Apr 15;99(3):1002-10

Sequential translocation of two phenobarbital-induced polysomal messenger ribonucleic acids from the nuclear envelope to the endoplasmic reticulum. Gonzalez FJ, et al. **Biochemistry** 1981 Apr 14; 20(8):2292-8

Barbiturates and transmitter release at the frog neuromuscular junction. Pincus JH, et al. **Brain Res** 1981 May 25;213(1):127-37

Barbiturate enhancement of GABA-mediated inhibition and activation of chloride ion conductance: correlation with anticonvulsant and anesthetic actions. Schulz DW, et al. **Brain Res** 1981 Mar 23; 209(1):177-88

Effects of phenobarbital upon triacylglycerol metabolism in the guinea pig. Goldberg DM, et al. **Can J Biochem** 1981 Jan;59(1):48-53

A comparison of the effects of pretreatment with phenobarbitone and 3-methylcholanthrene on the metabolism of aflatoxin B1 by rat liver microsomes and isolated hepatocytes in vitro. Metcalfe SA, et al. **Chem Biol Interact** 1981 May;35(2):145-57

Enzyme immunoassay for phenobarbital. Aoki K, et al. **Chem Pharm Bull (Tokyo)** 1980 Nov;28(11):3291-5

Barbiturate and hypnosedative withdrawal by a multiple oral phenobarbital loading dose technique. Robinson GM, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):71-6

The effect of phenobarbital and beta-naphthoflavone induction on the metabolism of biphenyl in the rat and mouse. Halpaap-Wood K, et al. **Drug Metab Dispos** 1981 Mar-Apr;9(2):97-102

The effect of 3-methylcholanthrene, Aroclor 1254, and phenobarbital induction on the metabolism of biphenyl by rat and mouse 9000g supernatant liver fractions. Halpaap-Wood K, et al. **Drug Metab Dispos** 1981 Mar-Apr;9(2):103-7

Changes in radioimmunoassayable luteinizing hormone-releasing hormone in discrete brain areas of the rat at various times on proestrus, diestrous day 1, and after phenobarbital administration. Wise PM, et al. **Endocrinology** 1981 Jun;108(6):2179-85

Structural gene products of the murine Ah complex. Differences in ontogenesis and glucosamine incorporation between liver microsomal cytochromes P1-450 and P-448 induced by polycyclic aromatic compounds. Negishi M, et al. **Eur J Biochem** 1981 Apr; 115(3):585-94

Influence of phenobarbital treatment on cimetidine kinetics. Somogyi A, et al. **Eur J Clin Pharmacol** 1981;19(5):343-7

In vivo and in vitro availability of commercial phenytoin formulations containing phenobarbitone. Shukla UA, et al. **Indian J Med Res** 1980 Dec;72:910-5

Selective induction of two different molecular species of cytochrome P-450 by phenobarbital and 3-methylcholanthrene. Harada N, et al. **J Biochem (Tokyo)** 1981 Jan;89(1):237-48

An immunohistochemical study on the localization and distributions of phenobarbital- and 3-methylcholanthrene-inducible cytochromes P-450 within the livers of untreated rats. Baron J, et al. **J Biol Chem** 1981 Jun 10;256(11):5931-7

The effects of phenytoin on phenobarbitone and primidone metabolism. Lambie DG, et al. **J Neurol Neurosurg Psychiatry** 1981 Feb; 44(2):148-51

Interactions among chloramphenicol, phenytoin, and phenobarbital in a pediatric patient. Powell DA, et al. **J Pediatr** 1981 Jun;98(6):1001-3

Evidence for a synergistic interaction between phenytoin and phenobarbital in experimental animals. Masuda Y, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):805-11

Induction effect of phenobarbital on the carbamazepine to carbamazepine-10, 11-epoxide pathway in rhesus monkeys. Patel IH, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):555-8

Effects of aging and phenobarbital on the rat liver microsomal drug-metabolizing system. Schmucker DL, et al. **Mech Ageing Dev** 1981 Feb;15(2):189-202

Central 5-hydroxytryptamine and the effects of hallucinogens and phenobarbital on operant responding in rats. Commissaris RL, et al. **Pharmacol Biochem Behav** 1981 May;14(5):595-601

Effect of phenobarbital on the level of translatable rat liver epoxide hydrolase mRNA. Pickett CB, et al. **Proc Natl Acad Sci USA** 1981 Feb;78(2):893-7

Critical periods for diphenylhydantoin and phenobarbital administration during gestation. Gauron EF, et al. **Psychol Rep** 1980 Dec; 47(3 Pt 2):1163-6

Cholesterol HDL in phenobarbital-treated male and female Wistar rats. Dessi S, et al. **Res Commun Chem Pathol Pharmacol** 1981 Feb; 31(2):375-8

Substrate-labeled fluorescent immunoassay for phenobarbital. Krausz LM, et al. **Ther Drug Monit** 1980;2(3):261-72

[Nutritional lipidic factors of enzymatic phenobarbital induction in the rat. Effects of quantitative and qualitative composition of dietary lipids (author's transl)] Mounié J, et al. **J Pharmacol** 1981 Jan-Mar; 12(1):3-14 (Eng. Abstr.) (Fre)

[Acute cotrimoxazole-induced thrombocytopenia, facilitating role of phenobarbital (author's transl)] Thorel JB, et al. **Sem Hop Paris** 1981 May 8-15;57(17-18):914-5 (Eng. Abstr.) (Fre)

[The effect of phenobarbital on anti-mitotic activity of vincristine and colchicine. Experimental study] Lambertini F, et al. **Arch Sci Med (Torino)** 1980 Jul-Sep;137(3):405-10 (Eng. Abstr.) (Ita)

[Effect of phenobarbital on hepatic glutathione and GSH-S transferase in the rat] Dore M, et al. **Boll Soc Ital Biol Sper** 1980 Nov 15; 56(21):2212-7 (Eng. Abstr.) (Ita)

[Metabolism of lipid-carrying proteins of rat liver in normal rats and after phenobarbital injection] Gapparov MM, et al. **Biokhimiia** 1980 Oct; 45(10):1744-8 (Eng. Abstr.) (Rus)

PHENOTHIAZINE TRANQUILIZERS

Outcome and risks of ultra-long-term treatment with an oral neuroleptic drug. Relationship between perazine serum levels and clinical variables in schizophrenic outpatients. Pietzcker A, et al. **Arch Psychiatr Nervenkr** 1981;229(4):315-29

Photoaffinity labeling of calmodulin by phenothiazine antipsychotics. Prozialeck WC, et al. **Mol Pharmacol** 1981 Mar;19(2):264-9

PHENOTHIAZINES

Thionine-Feulgen Congo Red — a new staining technique for automated cytology. Oud PS, et al. **Acta Histochem [Suppl] (Jena)** 1981; 24:199-206

Phenothiazine antagonism of calmodulin: a structurally-nonspecific interaction. Roufogalis BD. **Biochem Biophys Res Commun** 1981 Feb 12;98(3):607-13

Phenothiazines as reagents for the detection of faecal occult blood. Ahmed SA, et al. **Clin Chim Acta** 1981 Apr 9;111(2-3):275-8

Influence of phenothiazines or reserpine on the formation of 14C-glycine from U-14C-serine. Gründig E, et al. **Enzyme** 1981;26(1):43-8

Thermodynamics of partitioning and efflux of phenothiazines from liposomes. Ahmed M, et al. **J Membr Biol** 1981 Feb 28;58(3):181-9

High-performance liquid chromatographic determination of ethmozin in plasma. Whitney CC, et al. **J Pharm Sci** 1981 Apr;70(4):462-3

[Effect of indomethacin and nonachlazine on myocardial and cerebral tyrosine hydroxylase activity in rats] Mineeva MF, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):181-4 (Eng. Abstr.) (Rus)

PHENOXYBENZAMINE

Inhibition of renin secretion by intrarenal alpha-adrenoceptor blockade. Blair ML. **Am J Physiol** 1981 Jun;240(6):E682-8

Effect of adrenoceptor blocker and MAOI on postcoital utero-oviductal contractility, sperm transport, and sperm attachment to eggs in rabbits. Marsafy YM, et al. **Arch Androl** 1981 Jun;6(4):307-16

alpha-Difluoromethylornithine (alpha DFMO) and phenoxybenzamine hydrochloride in the treatment of chronic non-suppurative prostatitis. Dunzendorfer U. **Arzneimittelforsch** 1981;31(2):382-5

The role of calcium in the effects of noradrenaline and phenoxybenzamine on adrenergic transmitter release from atria: no support for negative feedback of release. Kalsner S. **Br J Pharmacol** 1981 Jun;73(2):363-71

Reactivation by cysteamine of vascular alpha adrenoceptors blocked by the tetramine disulfide benextramine and interaction of benextramine with phenoxybenzamine. Brasili L, et al. **Can J Physiol Pharmacol** 1980 Dec;58(12):1490-3

The effect of phenoxybenzamine on the relationship between glycerol release and cyclic AMP levels in the presence of insulin in epinephrine-stimulated rat adipocytes. Wong EH, et al. **FEBS Lett** 1981 May 18;127(2):217-20

Effects of phenoxybenzamine on bladder neck opening. Waterfall NB, et al. **J R Soc Med** 1980 May;73(5):345-7

Acceleration of beta-receptor desensitization in combined administration of antidepressants and phenoxybenzamine. Crews FT, et al. **Nature** 1981 Apr 30;290(5809):787-9

Treatment with trazodone plus phenoxybenzamine accelerates development of decreased type 2 serotonin binding in rat cortex. Taylor DP, et al. **Neuropharmacology** 1981 May;20(5):513-6

Phenoxybenzamine and bromocriptine attenuate need for REM sleep in rats. Radulovacki M, et al. **Pharmacol Biochem Behav** 1981 Mar;14(3):371-5

Phenoxybenzamine for benign prostatic obstruction. Review of 200 cases. Caine M, et al. **Urology** 1981 Jun;17(6):542-6

[Use of drugs to encourage emptying of neo-bladders] Perales L, et al. **Actas Urol Esp** 1981 Jan-Feb;5(1):59-62 (Eng. Abstr.) (Spa)

PHENYLALANINE

Use of aromatic amino acids as monitors of protein turnover. Williams IH, et al. **Am J Physiol** 1981 Jun;240(6):E677-81

Cross-tolerance between D-amino acids and morphine in mice. Filibeck U, et al. **Brain Res** 1981 May 11;212(1):227-9

[Phenylalanine burden in endogenous psychoses] Uebelhack R, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1980 Oct;32(10):631-3 (Ger)

[Uptake of phenylalanine and tyrosine in the lymphocytes of uremic patients] Esposito R, et al. **Minerva Nefrol** 1980 Jul-Sep;27(3):417-9 (Eng. Abstr.) (Ita)

PHENYLPROPANOLAMINE

Effect of norephedrine locally applied to the vas deferens on semen quality of rabbits. Ratnasooriya WD, et al. **Indian J Exp Biol** 1981 Jan;19(1):20-5

Combined treatment with estriol and alpha-adrenergic stimulation in elderly female patients with urinary incontinence. A pilot study. Beisland HO, et al. **J Oslo City Hosp** 1981 Mar;31(3):39-42

Sustained-release drug delivery system I: Coated ion-exchange resin system for phenylpropanolamine and other drugs. Raghunathan Y, et al. **J Pharm Sci** 1981 Apr;70(4):379-84

Effects of amphetamine and phenylpropanolamine on food intake in rats with ventromedial hypothalamic or dorsolateral tegmental damage. Wellman PJ, et al. **Physiol Behav** 1980 Dec;25(6):819-27

PHENYTOIN

Antigranulocyte antibodies and deranged immune function associated with phenytoin-induced serum sickness. Menitove JE, et al. **Am J Hematol** 1981;10(3):277-84

Phenytoin sodium solubility in three intravenous solutions. Pfeifle CE, et al. **Am J Hosp Pharm** 1981 Mar;38(3):358-62

Prediction of phenytoin dosage in relation to the variability of phenytoin plasma concentration. Van der Velde EA, et al. **Br J Clin Pharmacol** 1981 Jan;11(1):41-52

Effects of phenytoin on pyramidal neurons of the rat hippocampus. Hershkowitz N, et al. **Brain Res** 1981 Mar 16;208(2):487-92

Saturable binding of [3H]phenytoin to rat brain membrane fraction. Burnham WM, et al. **Can J Physiol Pharmacol** 1981 Apr;59(4):402-7

Metabolite interference in homogeneous enzyme immunoassay of phenytoin [letter] Aldwin L, et al. **Clin Chem** 1981 May;27(5):770-1

Effect of trifluoperazine, D600, and phenytoin on depolarization- and thyrotropin-releasing hormone-induced thyrotropin release from rat pituitary tissue. Fleckman A, et al. **Endocrinology** 1981 Jun;108(6):2072-7

New standards for phenytoin products. **FDA Drug Bull** 1981 Mar;11(1):4

Purification of phenytoin-binding site from the brain. Imazawa M, et al. **Folia Psychiatr Neurol Jpn** 1980;34(3):362

Modification of glybenclamide hypoglycaemia by phenytoin in rabbits. Singh RC, et al. **Indian J Exp Biol** 1981 Jan;19(1):54-6

Bioavailability in humans of solid dosage forms of phenytoin marketed in India. Baichwal AR, et al. **Indian J Med Res** 1980 Dec;72:916-9

In vivo and in vitro availability of commercial phenytoin formulations containing phenobarbitone. Shukla UA, et al. **Indian J Med Res** 1980 Dec;72:910-5

The effects of phenytoin on phenobarbitone and primidone metabolism. Lambie DG, et al. **J Neurol Neurosurg Psychiatry** 1981 Feb;44(2):148-51

Interactions among chloramphenicol, phenytoin, and phenobarbital in a pediatric patient. Powell DA, et al. **J Pediatr** 1981 Jun;98(6):1001-3

Prediction of phenytoin dosage requirements [letter] Sanders SW. **J Pediatr** 1981 May;98(5):856-7

Anticonvulsant potency of two deuterated analogues of phenytoin: 'DPH-5d and DPH-d5'. Dumont P, et al. **J Pharm Belg** 1981 Jan-Feb;36(1):21-6

Diphenylhydantoin enhances early adaptation in Aplysia giant neurons. Lewis DV Jr, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):41-5

Evidence for a synergistic interaction between phenytoin and phenobarbital in experimental animals. Masuda Y, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):805-11

Folic acid and phenytoin hyperplasia [letter] Inoue F, et al. **Lancet** 1981 Jul 11;2(8237):86

Separation of phenytoin and its metabolites by high-performance liquid chromatography. Chow SA, et al. **Life Sci** 1980 Dec 22-29;27(25-26):2477-82

Excessive frequency of phenytoin dosage [letter] Lane MJ, et al. **Med J Aust** 1981 Feb 21;1(4):191-2

Acute effects of phenytoin on peripheral nerve function in the rat. Marcus DJ, et al. **Muscle Nerve** 1981 Jan-Feb;4(1):48-50

Intravenous valproate: effects on plasma and saliva phenytoin levels. Pisani FD, et al. **Neurology (NY)** 1981 Apr;31(4):467-70

Phenytoin: plasma levels and behavioral changes associated with suppression of auditory evoked potentials in the cat. Faingold CL, et al. **Neuropharmacology** 1981 May;20(5):445-9

Effects of phenytoin on mouse cerebellar 5-hydroxytryptamine and norepinephrine. Fry BW, et al. **Neuropharmacology** 1981 Jun;20(6):623-5

Critical periods for diphenylhydantoin and phenobarbital administration during gestation. Gauron EF, et al. **Psychol Rep** 1980 Dec;47(3 Pt 2):1163-6

Maternal hyperoxia greatly reduces the incidence of phenytoin-induced cleft lip and palate in A/J mice. Millicovsky G, et al. **Science** 1981 May 8;212(4495):671-2

A comparison of plasma phenytoin level determinations by EMIT and gas-liquid chromatography in patients with renal insufficiency. Nandedkar AK, et al. **Ther Drug Monit** 1980;2(4):427-30

The effect of diethylstilbestrol treatment on the metabolism and biliary excretion of [14C]phenytoin in the isolated perfused rat liver. Montgomery C, et al. **Toxicol Appl Pharmacol** 1981 May;58(3):510-9

[Protection of the myocardium and coronary artery circulation (5)] Hirano T. **Kokyu To Junkan** 1980 Oct;28(10):1102 (Jpn)

PHOBIC DISORDERS

The treatment of phobic anxiety by zimelidine. Evans L, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):342-5

A pilot study of the effect of the 5-HT-uptake inhibitor, zimelidine, on phobic anxiety. Koczkas S, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):328-41

Differential diagnosis and treatment of panic attacks and phobic states. Liebowitz MR, et al. **Annu Rev Med** 1981;32:583-99 (46 ref.)

Exposure treatments for focal phobias. A review. Linden W. **Arch Gen Psychiatry** 1981 Jul;38(7):769-75 (49 ref.)

Phenelzine and exposure in the treatment of phobias. Solyom C, et al. **Biol Psychiatry** 1981 Mar;16(3):239-47

Agoraphobia: the 'what if' syndrome. Fier M. **J Med Soc NJ** 1981 Apr;78(4):286-8

Psychotropic drugs and behaviour therapy. Stern R. **Practitioner** 1981 Jan;225(1351):21-5

PHYSOSTIGMINE

[Effect of cholinergic factors on the state of erythrocyte membrane proteins of animals] Savina LS, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):153-5 (Eng. Abstr.) (Rus)

PILOCARPINE

Effects of cholinergic stimulation on levels and fatty acid composition of diacylglycerols in mouse pancreas. Banschbach MW, et al. **Biochim Biophys Acta** 1981 Jan 26;663(1):34–45

Effects of pilocarpine and paracentesis on occluding junctions between the nonpigmented ciliary epithelial cells. Ohnishi Y, et al. **Exp Eye Res** 1981 May;32(5):635–47

Effect of drugs interacting with adrenergic mechanisms and of adrenalectomy on pilocarpine-induced salivation in mice. Jha RJ, et al. **Indian J Med Res** 1980 Dec;72:923–6

Analysis of pilocarpine and isopilocarpine in ophthalmic solutions by normal-phase high-performance liquid chromatography. Dunn DL, et al. **J Pharm Sci** 1981 Apr;70(4):446–9

Quantitative determination of pilocarpine, isopilocarpine, pilocarpic acid, and isopilocarpic acid in clinical ophthalmic pilocarpine formulations by reversed-phase liquid chromatography. Noordam A, et al. **J Pharm Sci** 1981 Jan;70(1):96–7

[Stability and determination of pilocarpine in eyedrops] Jacob M, et al. **Pharm Acta Helv** 1981;56(2):59–63 (Fre)

[Effects of pilocarpine and carteolol, a new beta-adrenergic blocking agent on human aqueous humor dynamics (author's transl)] Araie M, et al. **Nippon Ganka Gakkai Zasshi** 1980 Dec 10;84(12):2085–91 (Eng. Abstr.) (Jpn)

PITUITARY HORMONE RELEASING HORMONES

Effect of calcium and potassium on basal and gonadotrophin-releasing hormone (GnRH) stimulated release of luteinizing hormone (LH). Zolman JC, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):26–32

Ovarian response to gonadotropin-releasing hormone in postpartum dairy cows. Garverick HA, et al. **Am J Vet Res** 1980 Oct;41(10):1582–5

Immunohistochemical localization of gonadotropin-releasing hormone (GnRH) in the brain and infundibulum of the sheep. Dees WL, et al. **Cell Tissue Res** 1981;215(1):181–91

Degradation of gonadotropin-releasing hormone by anterior pituitary enzymes. Hazum E, et al. **FEBS Lett** 1981 May 18;127(2):273–6

Effects of neonatal administration of gonadotropins-releasing hormone (Gn-RH) on the testis of mice. Unnithan RR, et al. **Indian J Exp Biol** 1981 Jan;19(1):12–5

[Trials to induce ovulation with Berlin-Chemie Gn-RH vet. in prepuberal gilts] Brüssow KP, et al. **Arch Exp Veterinaermed** 1981;35(2):285–90 (Eng. Abstr.) (Ger)

PITUITARY HORMONES

Hypothalamic hypophysiotropic hormones and neurotransmitter regulation: current views. Meites J, et al. **Annu Rev Pharmacol Toxicol** 1981;21:295–322 (160 ref.)

Specific stimulation of steroidogenesis in rat adrenal zona glomerulosa cells by pituitary peptides. Vinson GP, et al. **Biochem Biophys Res Commun** 1981 Mar 16;99(1):65–72

Regulation of tryptophan-niacin metabolism by hormones. Sanada H, et al. **J Nutr Sci Vitaminol (Tokyo)** 1980;26(6):617–27

PITUITARY HORMONES, ANTERIOR

New perspectives in neuropeptides. Biosynthesis from large precursors. The pro-opio-melanocortin model in the pars intermedia. Chrétien M, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):699–713

Concentrations of pituitary, gonadal and adrenal hormones in serum of laying and broody white rock hens (Gallus domesticus). Bedrak E, et al. **J Endocrinol** 1981 May;89(2):197–204

Serum concentrations of prolactin, luteinizing hormone, growth hormone, corticosterone, progesterone, testosterone and oestradiol in relation to broodiness in domestic turkeys (Meleagris gallopavo). Harvey S, et al. **J Endocrinol** 1981 May;89(2):187–95

Chemistry and biosynthesis of pro-opiomelanocortin. ACTH, MSH's, endorphins and their related peptides. Chrétien M, et al. **Mol Cell Biochem** 1981 Jan 28;34(2):101–27 (232 ref.)

Characterisation of the pro opiocortin family of peptides in human cerebrospinal fluid McLoughlin L, et al. **Neuroendocrinology** 1981 Apr;32(4):209–12

Opiocortin peptides: localization, source and avenues of transport. de Kloet ER, et al. **Pharmacol Ther** 1981;12(2):321–51 (193 ref.)

[Different effects of tricyclic (clomipramine and amitriptyline) and tetracyclic (maprotiline) antidepressors on the release of thyroid stimulating hormone, prolactin and growth hormone to thyrostimulating releasing hormone in patients with psychoaffective disorders (author's transl)] Schlienger JL, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):584–99 (Eng. Abstr.) (Fre)

PRAZEPAM

Concentrations of N-descyclopropylmethylprazepam in whole-blood, plasma, and milk after administration of prazepam to humans. Brodie RR, et al. **Biopharm Drug Dispos** 1981 Jan-Mar;2(1):59–68

PREDNISONE

A study on the release of prednisone from new ointment bases containing various additives. Attia MA, et al. **Pharmazie** 1981;36(1):21–3

PROBLEM SOLVING

Role of the neostriatal dopaminergic activity in sequencing and selecting behavioural strategies: facilitation of processes involved in selecting the best strategy in a stressful situation. Cools AR. **Behav Brain Res** 1980 Oct;1(5):361–78

PROGESTERONE

Influence of phenobarbital, chlorpromazine, progesterone and phenylbutazone on the biliary cholesterol excretion in rats. Barth A, et al. **Acta Biol Med Ger** 1980;39(11-12):1217–26

Effects of ovarian steroids and pregnancy on adrenergic nerves of uterus and oviduct. Marshall JM. **Am J Physiol** 1981 May;240(5):C165–74 (83 ref.)

Negative feedback effects of progesterone correlated with changes in hypothalamic norepinephrine and dopamine turnover rates, median eminence luteinizing hormone-releasing hormone, and peripheral plasma gonadotropins. Rance N, et al. **Endocrinology** 1981 Jun;108(6):2194–9

Effects of estradiol and progesterone on catecholamine turnover rates in discrete hypothalamic regions in ovariectomized rats. Wise PM, et al. **Endocrinology** 1981 Jun;108(6):2186–93

Deoxycorticosterone biosynthesis from progesterone in kidney tissue of the human fetus. Winkel CA, et al. **J Clin Endocrinol Metab** 1981 Jul;53(1):10–5

Regulation of Ca2+ and cyclic AMP during the first meiotic division in amphibian oocytes by progesterone. Kostellow AB, et al. **J Cyclic Nucleotide Res** 1980;6(5):347–58

Inhibition of HCG-induced cyclic AMP accumulation and steroidogenesis in rat luteal cells by an LHRH agonist. Massicotte J, et al. **J Steroid Biochem** 1981 Mar;14(3):239–42

Effect of progesterone therapy on the responses of the isolated rat stomach fundus strip preparations to 5-hydroxytryptamine and acetylcholine. Qayum A, et al. **JPMA** 1981 Apr;31(4):84–8

Adrenal steroids and extinction behavior: antagonism by progesterone, deoxycorticosterone and dexamethasone of a specific effect of corticosterone. Bohus B, et al. **Life Sci** 1981 Jan 26;28(4):433–40

A dopamine agonist stimulates progesterone secretion from adrenal gland. Kalra SP, et al. **Life Sci** 1981 Mar 30;28(13):1467–9

Deoxycorticosterone biosynthesis in human kidney: potential for formation of a potent mineralocorticosteroid in its site of action. Winkel CA, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7069–73

[Induction of lactation in cattle after short-term hormonal treatment] Manunta G, et al. **Boll Soc Ital Biol Sper** 1981 Jan 30;57(2):172–8 (Eng. Abstr.) (Ita)

PROLACTIN

Serum prolactin and thyrotrophin responses to thyrotrophin-releasing hormone at different times of the day in normal women. Pérez-López FR, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):7–11

The effect of dopamine on prolactin cells in vivo. Wurchol JB, et al. **Acta Med Pol** 1980;21(4):403–4

Influence of estrogens on tuberoinfundibular and striatal dopaminergic systems in the rat. Labrie F, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):658–73

Haloperidol and droperidol treatment in schizophrenics. Clinical application of the 'prolactin-model'. Langer G, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):574–83

Effect of antidepressants, lithium and electroconvulsive treatment on rat serum prolactin levels. Meltzer HY, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):100–21

Immunoreactive endorphin peptides and prolactin in umbilical vein and maternal blood. Kimball CD, et al. **Am J Obstet Gynecol** 1981 May 15;140(2):157–64

Resumption of prolactin secretion after dopaminergic inhibition: differential effects of dopamine and its agonists. Woolf PD. **Am J Physiol** 1981 Jun;240(6):E700–4

The effect of amoxapine and imipramine on serum prolactin levels. Cooper DS, et al. **Arch Intern Med** 1981 Jul;141(8):1023–5

Exaggerated hyperprolactinemia in response to thiothixene [letter] Ash PR, et al. **Arch Neurol** 1981 Aug;38(8):534–5

Paradoxical effects of D-Trp6-LHRH in immature female rats correlated with changes in ACTH, prolactin, and corticosterone levels. Nekola MV, et al. **Biol Reprod** 1981 Apr;24(3):505–11

Role of the ovary in controlling luteinizing hormone, follicle stimulating hormone, and prolactin secretion during and after lactation in pigs. Stevenson JS, et al. **Biol Reprod** 1981 Mar;24(2):341–53

Inhibition of LH and prolactin release in the cycling rat following inhibition of dopamine-beta-hydroxylase. Voogt JL, et al. **Brain Res** 1981 Mar 30;209(2):411-9

Pituitary function in normoprolactinaemic infertile men receiving bromocriptine. Glatthaar C, et al. **Clin Endocrinol (Oxf)** 1980 Nov; 13(5):455-9

Two new dopamine agonists that are long acting in vivo but short acting in vitro. Grossman A, et al. **Clin Endocrinol (Oxf)** 1980 Dec; 13(6):595-9

Effect of propranolol treatment on serum prolactin level in schizophrenic patients. Elizur A, et al. **Commun Psychopharmacol** 1980;4(3):203-6

Changes in ovarian 3 alpha-androstanediol response to human chorionic gonadotropin during puberty in the rat: modulatory role of prolactin. Advis JP, et al. **Endocrinology** 1981 Jul;109(1):223-8

Prolactin regulation of cytological differentiation of mammary epithelial cells in periparturient cows. Akers RM, et al. **Endocrinology** 1981 Jul; 109(1):31-40

Prolactin regulation of milk secretion and biochemical differentiation of mammary epithelial cells in periparturient cows. Akers RM, et al. **Endocrinology** 1981 Jul;109(1):23-30

A serotonergic mechanism of the prolactin-stimulating action of metoclopramide. Fang VS, et al. **Endocrinology** 1981 May; 108(5):1622-7

Hormonal control of growth in the infant rat. Glasscock GF, et al. **Endocrinology** 1981 Jul;109(1):176-84

Dopamine in hypophysial portal plasma and prolactin in systemic plasma of rats treated with 5-hydroxytryptamine. Pilotte NS, et al. **Endocrinology** 1981 Jun;108(6):2137-41

The lateral and medial median eminence: distribution of dopamine, norepinephrine, and luteinizing hormone-releasing hormone and the effect of prolactin on catecholamine turnover. Selmanoff M. **Endocrinology** 1981 May;108(5):1716-22

Comparison of acute effects of dynorphin and beta-endorphin on prolactin release in the rat. Van Vugt DA, et al. **Endocrinology** 1981 May; 108(5):2017-8

Effects of prolactin and bromocriptine on the luteal phase in infertile women. Fredricsson B, et al. **Eur J Obstet Gynaecol Reprod Biol** 1981 Apr;11(5):319-33

Possible role of prolactin in the modification of medial basal hypothalamic glutamic acid decarboxylase activity. Prato A, et al. **Eur J Pharmacol** 1981 Apr 24;71(1):169-72

Effect of apomorphine hydrochloride administration on serum concentrations of prolactin and growth hormone in cattle. Gorewit RC. **Experientia** 1981 Feb 15;37(2):204-6

Effects of hyperprolactinemia and bromocriptine on the human endometrium. Nunley WC Jr, et al. **Fertil Steril** 1981 Apr; 35(4):479-80

Prolactin inhibits the induction of its own renal receptors in Rana catesbeiana tadpoles. White BA, et al. **Gen Comp Endocrinol** 1981 Jan; 43(1):30-8

Cell population kinetics in tadpole limb epidermis during thyroxine-induced, spontaneous, and prolactin-inhibited metamorphosis. Wright ML, et al. **Gen Comp Endocrinol** 1981 Apr; 43(4):451-61

Ergot drugs suppress plasma prolactin and lactation but not aggression in parturient mice. Mann M, et al. **Horm Behav** 1980 Dec; 14(4):319-28

Growth hormone, prolactin, and growth responses in hyperkinetic males treated with d-amphetamine. Greenhill LL, et al. **J Am Acad Child Psychiatry** 1981 Winter;20(1):84-103

Regulation of pituitary function and prolactin production in the GH4 cell line by vitamin D. Murdoch GH, et al. **J Biol Chem** 1981 Apr 25;256(8):4050-3

Diurnal rhythm of plasma immunoreactive beta-endorphin and its relationship to sleep stages and plasma rhythms of cortisol and prolactin. Dent RR, et al. **J Clin Endocrinol Metab** 1981 May;52(5):942-7

The effect of histamine and H1 and H2 receptors on prolactin and luteinizing hormone release in humans: sex differences and the role of stress. Pontiroli AE, et al. **J Clin Endocrinol Metab** 1981 May; 52(5):924-8

Thyrotropin-releasing hormone stimulation of prolactin release from clonal rat pituitary cells: evidence for action independent of extracellular calcium. Gershengorn MC, et al. **J Clin Invest** 1981 Jun; 67(6):1769-76

Partial remission of hyperprolactinemic amenorrhea after bromocriptine-induced pregnancy. Campagnoli C, et al. **J Endocrinol Invest** 1981 Jan-Mar;4(1):85-91

Serum prolactin concentrations in mangabey (Cercocebus atys lunulatus) and patas (Erythrocebus patas) monkeys in response to stress, ketamine, TRH, sulpiride and levodopa. Aidara D, et al. **J Reprod Fertil** 1981 May;62(1):165-72

Autonomous prolactin secretion in schizophrenic male on long-term neuroleptic therapy [letter] Semple CG, et al. **Lancet** 1981 Jul 11; 2(8237):103

Slow decline of plasma drug and prolactin levels after discontinuation of chronic treatment with depot neuroleptics [letter] Wistedt B, et al. **Lancet** 1981 May 23;1(8230):1163

Differential effects of cannabinoid exposure and stress on plasma prolactin, growth hormone and corticosterone levels in male mice. Dalterio SL, et al. **Life Sci** 1981 Feb 16;28(7):761-6

Thyroid hormones are required for daily rhythms of plasma corticosterone and prolactin concentration. Ottenweller JE, et al. **Life Sci** 1981 Mar 2;28(9):1033-40

Effect of prolactin and prostaglandins on the stimulation of prolactin binding sites in the male rat liver. Barkey RJ, et al. **Mol Cell Endocrinol** 1981 Feb;21(2):129-38

Dopaminergic control of prolactin mRNA accumulation in the pituitary of the male rat. Brocas H, et al. **Mol Cell Endocrinol** 1981 Apr; 22(1):25-30

Prolactin and the regulation of adipose-tissue metabolism during lactation in rats. Flint DJ, et al. **Mol Cell Endocrinol** 1981 May;22(2):265-75

Stimulation of prolactin secretion by neuroleptics in rats with medial basal hypothalamic lesions. Cheung CY, et al. **Neuroendocrinology** 1981 Jun; 32(6):370-4

Dopamine levels in hypophysial stalk plasma and prolactin levels in peripheral plasma of the lactating rat: effects of a simulated suckling stimulus. de Greef WJ, et al. **Neuroendocrinology** 1981 Apr; 32(4):229-33

GABA and muscimol inhibit the release of prolactin from dispersed rat anterior pituitary cells. Grossman A, et al. **Neuroendocrinology** 1981 Mar;32(3):145-9

Effects of the interaction between methysergide and clonidine on growth hormone and prolactin secretion in normal man. Agnati LF, et al. **Neurosci Lett** 1981 Feb 6;21(3):333-8

Experimental hyperprolactinemia and hypoprolactinemia and human chorionic gonadotropin during early pregnancy. Viinikka L, et al. **Obstet Gynecol** 1981 Apr;57(4):441-3

Interaction of morphine with the cholinergic system on prolactin release. Fanjul LF, et al. **Proc Soc Exp Biol Med** 1981 Apr;166(4):542-5

Differential prolactin responses to haloperidol and TRH in normal adult men. Hays SE, et al. **Psychoneuroendocrinology** 1981;6(1):45-52

Clozapine: plasma levels and prolactin response. Kane JM, et al. **Psychopharmacology (Berlin)** 1981;73(2):184-7

Neuroendocrine tests during treatment with neuroleptic drugs: I. Plasma prolactin response to chlorpromazine challenge. Kolakowska T, et al. **Psychopharmacology (Berlin)** 1981;72(3):283-5

Effect of 5,7-dihydroxytryptamine on serotonergic control of prolactin secretion and behavior in rats. Kuhn CM, et al. **Psychopharmacology (Berlin)** 1981;73(2):188-93

LH and prolactin in estrogenized female rats: response to LHRH. Vaticón MD, et al. **Rev Esp Fisiol** 1980 Dec;36(4):371-6

[Comparative evolution of prolactin plasma levels during antidepressant treatment (author's transl)] Vandel B, et al. **Therapie** 1981 Jan-Feb; 36(1):87-94 (Eng. Abstr.) (Fre)

[Evaluation of motor behavior in conditions of hyperprolactinemia] Rampello L, et al. **Acta Neurol (Napoli)** 1981 Feb;36(1):297-301 (Eng. Abstr.) (Ita)

[Role of the prostaglandin system in the monoaminergic control of prolactin release in the rat] Costa G, et al. **Boll Soc Ital Biol Sper** 1979 Aug 15;55(15):1492-7 (Eng. Abstr.) (Ita)

[Clinical significance of prolactin in amenorrheas] Garzarelli S, et al. **Minerva Ginecol** 1981 Apr;33(4):315-20 (Eng. Abstr.) (Ita)

[Use of dopaminergic drugs (pyridoxine, 2-bromo-alpha-ergocriptine, piribedil) in blocking lactation] Lo Dico G, et al. **Minerva Ginecol** 1980 Sep;32(9):771-9 (Eng. Abstr.) (Ita)

[A study on the significance of bromocriptine (CB-154) administration in normoprolactinemic anovulatory women (author's transl)] Ishimaru T, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 Oct; 32(10):1583-90 (Eng. Abstr.) (Jpn)

[Influences of hypothalamus prolactin inhibiting factor and releasing factors and pineal gland on pituitary prolactin secreting functions (author's transl)] Takahashi K, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 Sep;32(9):1249-56 (Jpn)

[Prolactin secretion during normal pregnancy and puerperium, particularly with regard to nursing (author's transl)] Wada Y. **Nippon Sanka Fujinka Gakkai Zasshi** 1980 Jul;32(7):891-8 (Eng. Abstr.) (Jpn)

[Adrenal cortical androgen function in women suffering from sterility and hyperprolactinemia] Pobedinskii NM, et al. **Akush Ginekol (Mosk)** 1981 Feb;(2):10-2 (Eng. Abstr.) (Rus)

[Prolactin secretion inhibition as affected by leucine enkephalin] Iudaev NA, et al. **Dokl Akad Nauk SSSR** 1981;256(2):500-2 (Rus)

PROMAZINE

The metabolism of promazine and acetylpromazine in the horse. Dewey EA, et al. **Drug Metab Dispos** 1981 Jan-Feb;9(1):30-6

PROMETHAZINE

A comparative study of the interaction of chlorpromazine, trifluoperazine, and promethazine with mouse brain tubulin. Rao AG, et al. **Mol Pharmacol** 1981 Mar;19(2):295-301

PROPANEDIOLS

Toxicological assessment of heat transfer fluids proposed for use in solar energy applications, II. Marshall TC, et al. **Toxicol Appl Pharmacol** 1981 Mar 30;58(1):31–8

PROPRANOLOL

DL-propranolol and chlorpromazine following admission for schizophrenia. A controlled comparison. Yorkston NJ, et al. **Acta Psychiatr Scand** 1981 Jan;63(1):13–27

Propranolol: the preferred palliation for tetralogy of Fallot. Garson A Jr, et al. **Am J Cardiol** 1981 May;47(5):1098–104

Shortened platelet survival time and enhanced heart rate responses after abrupt withdrawal of propranolol from normal subjects. Goldstein RE, et al. **Am J Cardiol** 1981 May;47(5):1115–22

Treatment of diazepam withdrawal syndrome with propranolol. Abernethy DR, et al. **Ann Intern Med** 1981 Mar;94(3):354–5

Antagonism of calmodulin by local anesthetics, mepacrine, and propranolol. Volpi M, et al. **Ann NY Acad Sci** 1980;356:441–2

Effect of adrenoceptor blocker and MAOI on postcoital utero-oviductal contractility, sperm transport, and sperm attachment to eggs in rabbits. Marsafy YM, et al. **Arch Androl** 1981 Jun;6(4):307–16

Bioavailability of propranolol in the dog. Tse FL, et al. **Arch Int Pharmacodyn Ther** 1980 Dec;248(2):180–9

The effect of propranolol on the osmotic fragility of red cells and liposomes and the influence of the drug on glycerol transport across the membrane of red cells. Surewicz KW, et al. **Biochem Pharmacol** 1981 Apr;30(8):839–42

Interaction of propranolol with model phospholipid membranes. Monolayer, spin label and fluorescent spectroscopy studies. Surewicz WK, et al. **Biochim Biophys Acta** 1981 May 6;643(2):387–97

Bioavailability of sustained release propranolol formulations. McAinsh J, et al. **Biopharm Drug Dispos** 1981 Jan–Mar;2(1):39–48

A propranolol radioimmunoassay and its use in the study of its pharmacokinetics following low doses. Mould GP, et al. **Biopharm Drug Dispos** 1981 Jan–Mar;2(1):49–57

Inhibition of the plasma cholinesterase variants by propranolol. Whittaker M, et al. **Br J Anaesth** 1981 May;53(5):511–6

Inhibitory effects of propranolol on the calcium current of Helix neurones. Akaike N, et al. **Br J Pharmacol** 1981 Jun;73(2):431–4

Inhibition of lymphocyte capping and transformation by propranolol and related compounds. Anderton BH, et al. **Br J Pharmacol** 1981 Jan; 72(1):69–74

Influence of cimetidine on pharmacokinetics of propranolol. Heagerty AM, et al. **Br Med J [Clin Res]** 1981 Jun 13;282(6280):1917–9

Reduction of first-pass hepatic clearance of propranolol by food. McLean AJ, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):31–4

Propranolol and sotalol metabolism after a drinking party. Sotaniemi EA, et al. **Clin Pharmacol Ther** 1981 Jun;29(6):705–10

The effect of prolonged administration of propranolol and timolol on the growth and the heart of growing rabbits. Evemy KL, et al. **Clin Sci** 1981 Jan;60(1):33–40

Effect of propranolol treatment on serum prolactin level in schizophrenic patients. Elizur A, et al. **Commun Psychopharmacol** 1980;4(3):203–6

Propranolol and the respiratory, circulatory, and ECG responses to high altitude. Boutellier U, et al. **Eur J Applied Physiol** 1981;46(2):105–19

Exercise-induced release of pancreatic polypeptide and its inhibition by propranolol: evidence for adrenergic stimulation. Feurle GE, et al. **Eur J Clin Invest** 1980 Jun;10(3):249–51

The effect of a single dose of propranolol on human erythrocytes in vivo. Reinhart W, et al. **Eur J Clin Invest** 1981 Feb;11(1):65–8

Relaxation of isolated dog coronary artery induced by propranolol. Sakanashi M, et al. **Eur J Pharmacol** 1981 Mar 5;70(1):83–5

Effects of DL-propranolol on the thermoregulatory responses of rats at different ambient temperatures. Lin MT, et al. **Experientia** 1981 Apr 15;37(4):370–1

Inhibition of antigen-induced and anti-immunoglobulin-induced capping by hydrocortisone and propranolol. Ashman RF, et al. **Immunopharmacology** 1981 Feb;3(1):41–7

Separation of enantiomeric amines by ion-pair chromatography. Pettersson C, et al. **J Chromatogr** 1981 Jan 16;204:179–83

Chronic dog intestinal loop model for studying drug absorption as exemplified by beta-adrenoreceptor blocking agents, atenolol and propranolol. Taylor DC, et al. **J Pharm Sci** 1981 May;70(5):516–21

Influence of the route of administration on the mean hepatic extraction ratio of propranolol in the rat. Suzuki T, et al. **J Pharmacobiodyn** 1980 Nov;3(11):603–11

Propranolol as cause of watery nasal secretion [letter] Malm L. **Lancet** 1981 May 2;1(8227):1006

Benzodiazepine withdrawal symptoms and propranolol. Tyrer P, et al. **Lancet** 1981 Mar 7;1(8219):520–2

Increased plasma protein binding of propranolol in rabbits with acute renal failure. Fichtl B, et al. **Life Sci** 1981 Jan 5;28(1):31–5

Effects of propranolol on the adenylate cyclase activities in the arteries and ventricle of dog. Murthy VV. **Life Sci** 1980 Dec 22–29; 27(25–26):2645–8

Self-poisoning with propranolol. Tynan RF, et al. **Med J Aust** 1981 Jan 24;1(2):82–3

The inhibition by (+/−)-propranolol of the positive inotropic effects of (+/−)-isoprenaline and (−)-noradrenaline. Competitive antagonism and saturable uptake. Ebner F. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):96–107

Propranolol differentially blocks the methamphetamine-induced depression of tryptophan hydroxylase in various rat brain regions. Bakhit C, et al. **Neurosci Lett** 1981 Apr 9;23(1):99–103

Local anesthetics, mepacrine, and propranolol are antagonists of calmodulin. Volpi M, et al. **Proc Natl Acad Sci USA** 1981 Feb; 78(2):795–9

Dextro-propranolol in schizophrenia. Hirsch SR, et al. **Prog Neuropsychopharmacol** 1980;4(6):633–7

Effects of propranolol on the locomotor stimulation induced by activation of postsynaptic catecholamine receptors. Hallberg H, et al. **Psychopharmacology (Berlin)** 1981;72(3):227–31

The lack of effect of propranolol on the intestinal phase secretion in the dog. Grabner P, et al. **Scand J Gastroenterol** 1981;16(1):65–70

[Beta-adrenergic receptors and paradoxical sleep in the rat] Lanfumey L, et al. **C R Acad Sci [D] (Paris)** 1981 Mar 2;292(9):645–7 (Eng. Abstr.) **(Fre)**

[Possible effects of propranolol on the estrous cycle of the rat] Bruguerolle B, et al. **C R Soc Biol (Paris)** 1981;175(1):87–90 (Eng. Abstr.) **(Fre)**

[Use of the beta receptor blockader propranolol (Obsidan), in oral surgery] Neumann HJ, et al. **Stomatol DDR** 1980 Dec;30(12):908–12 (Eng. Abstr.) **(Ger)**

[Effect of the beta-receptor blockers propranolol and talinolol on glucose-orciprenaline induced insulin secretion, glucose tolerance and the behavior of nonesterified free fatty acids in metabolically normal probands.] Möricke R, et al. **Z Gesamte Inn Med** 1981 Mar; 36(5):263–7 (Eng. Abstr.) **(Ger)**

[Preliminary study of the combined administration of furosemide and propranolol. Evaluation of serum propranolol] Volpe M, et al. **Boll Soc Ital Cardiol** 1978;23(6):1001–5 **(Ita)**

[Behavior of the number of lysosomes in the placenta of pregnant rats subjected to acute stress and previously treated with 1-isopropylamino-3-(1-naphthyloxy)-2-propanol hydrochloride] Kulay MN, et al. **Rev Paul Med** 1980 Nov–Dec;96(5–6):96–9 (Eng. Abstr.) **(Por)**

PROSTAGLANDINS

Effect of prostaglandin synthesis inhibition on the central activity of noradrenaline in rats. Brus R, et al. **Acta Physiol Pol** 1981 Jan–Feb; 32(1):47–51

Evolution of ideas on the role of prostaglandins in inflammation. Grygiewski RJ. **Agents Actions [Suppl]** 1980;7:247–51 (24 ref.)

Effects of cannabinoids and female exposure on the pituitary-testicular axis in mice: possible involvement of prostaglandins. Dalterio S, et al. **Biol Reprod** 1981 Mar;24(2):315–22

Effects of nerve stimulation and of administration of noradrenaline or potassium chloride upon the release of prostaglandins, I2, E2, and F2 alpha from te perfused mesenteric arterial bed of the rabbit. Pipili E, et al. **Br J Pharmacol** 1981 Jan;72(1):89–93

Prostaglandin involvement in contractions evoked in rabbit detrusor by field stimulation and by adenosine 5'-triphosphate. Downie JW, et al. **Can J Physiol Pharmacol** 1981 Mar;59(3):253–60

Pharmacological studies of the involvement of hypothalamic prostaglandins in the regulation of thyrotropin secretion. Wright KC, et al. **Environ Health Perspect** 1981 Apr;38:83–8

Glomerulopressin in dogs' mesenteric blood flow and prostaglandins. del Castillo E, et al. **Horm Metab Res** 1981 Feb;13(2):126–7

Participation of prostaglandins in the vasodepressor effect of substance P. Pals DT, et al. **J Pharm Pharmacol** 1981 Feb;33(2):110–1

Effect of PGD2, PGE2 PGF2 alpha and PGI on blood pressure, heart rate and plasma catecholamine responses to spinal cord stimulation in the rat. Feuerstein G, et al. **Prostaglandins** 1981 Feb;21(2):189–206

6-keto-PGE1 exhibits more potent bronchodilatory activity in the cat than its precursor, PGI2. Spannhake EW, et al. **Prostaglandins** 1981 Feb;21(2):267–75

Influence of prostaglandins on vasoconstrictor responses in the hindquarters vascular bed of the cat. Lippton HL, et al. **Prostaglandins Med** 1981 Feb;6(2):183–202

The mechanism of the inhibitory effect of protease inhibitors on platelet aggregation and cellular synthesis of prostaglandins. I. The effect on the release of arachidonic acid from phospholipids. Kosaki G, et al. **Thromb Res** 1980 Dec 1–15;20(5–6):587–98

[Role of the prostaglandin system in the monoaminergic control of prolactin release in the rat] Costa G, et al. **Boll Soc Ital Biol Sper** 1979 Aug 15;55(15):1492–7 (Eng. Abstr.) **(Ita)**

[Changes in the morphofunctional status of the capillary system of the cerebral cortex in cats exposed to adrenergic stimulation while prostaglandin biosynthesis is inhibited] Gabrielian ES, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):173–5 (Eng. Abstr.) **(Rus)**

[Reactions of an identified edible snail neuron to application of peptides, mediators, prostaglandins, and cyclic nucleotides] Osipovskii SA, et al. **Neirofiziologiia** 1981;13(1):80-7 (Eng. Abstr.) (Rus)

PSYCHIATRIC STATUS RATING SCALES

The Hamilton depression scale. Evaluation of objectivity using logistic models. Bech P, et al. **Acta Psychiatr Scand** 1981 Mar;63(3):290-9

PSYCHIATRY

An interdisciplinary comparison of consultation outcomes. Psychiatry vs cardiology. Popkin MK, et al. **Arch Gen Psychiatry** 1981 Jul; 38(7):821-5

Neuropsychopharmacology research in psychiatry at Yale University. Bowers M Jr, et al. **Psychopharmacol Bull** 1981 Apr;17(2):17-39

Daytime effects of L-tryptophan [proceedings] Spinweber CL. **Psychopharmacol Bull** 1981 Jan;17(1):81-2

PSYCHOLOGY, COMPARATIVE

Comparative psychopharmacology. Lagerspetz KY. **Curr Dev Psychopharmacol** 1981;6:1-43 (182 ref.)

PSYCHOPATHOLOGY

[Documentation of psychopathological data in psychopharmacotherapy] Kühne GE, et al. **Agressologie** 1980;21(A):1-5 (Eng. Abstr.) (Ger)

PSYCHOPHARMACOLOGY

Comparative psychopharmacology. Lagerspetz KY. **Curr Dev Psychopharmacol** 1981;6:1-43 (182 ref.)

The psychopharmacology of aggression and social behavior. Symposium of the International Society for Research on Aggression. July 12, 1980, Groningen, The Netherlands. **Pharmacol Biochem Behav** 1981; 14 Suppl 1:1-124

A simple system for control of the continuous performance test in psychopharmacological research. Aman MC, et al. **Prog Neuropsychopharmacol** 1980;4(6):621-6

Research center reports. Current research activities in India. Bagadia VN. **Psychopharmacol Bull** 1981 Apr;17(2):14-6

Neuropsychopharmacology research in psychiatry at Yale University. Bowers M Jr, et al. **Psychopharmacol Bull** 1981 Apr;17(2):17-39

Department of Health and Human Services regulations affecting psychopharmacology research. Reatig N. **Psychopharmacol Bull** 1981 Apr;17(2):56-65

On the use of repeated measures designs in psychopharmacology. Vitaliano PP, et al. **Psychopharmacology (Berlin)** 1981;72(3):247-9

[2d Czechoslovakian Symposium of Psychopharmacology. Smolenice, 28-30 September 1977] **Agressologie** 1980;21(A):1-69 (Ger)

PSYCHOSES, SUBSTANCE-INDUCED

A primate analogue of amphetamine-induced behaviors in humans. Haber S, et al. **Biol Psychiatry** 1981 Feb;16(2):181-96

Stimulant-induced psychosis: an evaluation of animal methods. Segal DS, et al. **Essays Neurochem Neuropharmacol** 1981;5:95-129 (123 ref.)

PSYCHOTHERAPY

Treatment of the seriously disturbed adolescent. Miller D. **Adolesc Psychiatry** 1980;8:469-81

Psychotherapeutic drug recommendations based on the Mini-Mult. Siddall JW, et al. **Psychol Rep** 1980 Dec;47(3 Pt 2):1283-8

[Cooperation of pharmacotherapy and psychotherapy: an experimental illustration] Caplová T, et al. **Agressologie** 1980;21(A):37-9 (Eng. Abstr.) (Ger)

[Suicide prevention in psychoses and combined pharmacotherapy and psychotherapy] Richter H. **Agressologie** 1980;21(A):41-3 (Ger)

PSYCHOTIC DISORDERS

Antidepressants: old drugs, new uses. Harris E. **Am J Nurs** 1981 Jul; 81(7):1308-9

Antipsychotic medications. Harris E. **Am J Nurs** 1981 Jul; 81(7):1316-23

Auditory brain stem evoked responses in hospitalized patients undergoing drug treatment or ECT. Small JG, et al. **Biol Psychiatry** 1981 Mar; 16(3):287-90

Clinical processes and central dopaminergic activity in psychotic disorders. Bowers MB Jr, et al. **Commun Psychopharmacol** 1980; 4(3):177-83

The effects of neuroleptic drugs on the social interactions of hospitalized psychotic patients. Rosen AJ, et al. **J Nerv Ment Dis** 1981 Apr; 169(4):240-3

Classification of endorphins/enkephalins in brain physiology and pathology (based on EEG and clinical study of synthetically-modified methionine-enkephalin). Roubicek J, et al. **Prog Neuropsychopharmacol** 1980;4(4-5):507-18

A symptom profile analysis of antipsychotic drug treatment: nonparametric multidimensional technique. Shalif I, et al. **Psychiatry Res** 1981 Feb;4(1):1-12

The pharmacological treatment of schizoaffective disorder-depressed: a review of the literature [proceedings] Spiker DG. **Psychopharmacol Bull** 1981 Jan;17(1):75-8

Concentrations of chlorpromazine and two of its active metabolites in plasma and cerebrospinal fluid of psychotic patients treated with fixed drug doses. Wode-Helgodt B, et al. **Psychopharmacology (Berlin)** 1981; 73(1):55-62

[Suicide prevention in psychoses and combined pharmacotherapy and psychotherapy] Richter H. **Agressologie** 1980;21(A):41-3 (Ger)

[Pharmacological treatment of psychiatric emergencies in general practice (author's transl)] Wildbolz A. **Praxis** 1981 Feb 3;70(6):211-4 (Eng. Abstr.) (Ger)

[Psychopathologic aspects of the course of idiopathic psychoses] Janzarik W. **Psychiatr Clin (Basel)** 1980;13(3-4):139-49 (Eng. Abstr.) (Ger)

[Phenylalanine burden in endogenous psychoses] Uebelhack R, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1980 Oct;32(10):631-3 (Ger)

QUINIDINE

Effects of chronic oral quinidine on left ventricular performance. O'Rourke RA, et al. **Am Heart J** 1981 Jun;101(6):769-73

Effect of quinidine on positive inotropic action of digoxin. Williams JF Jr, et al. **Am J Cardiol** 1981 May;47(5):1052-5

The digoxin-quinidine interaction: serum protein binding unlikely to be involved. Fichtl B, et al. **Br J Clin Pharmacol** 1981 Jan;11(1):94-6

Quinidine determination in serum: enzyme immunoassay (EIA) V HPLC [letter] Ha HR, et al. **Br J Clin Pharmacol** 1981 Mar;11(3):312-4

The effect of quinidine and its metabolites on the electrocardiogram and systolic time intervals: concentration--effect relationships. Holford NH, et al. **Br J Clin Pharmacol** 1981 Feb;11(2):187-95

Pharmacokinetics of digoxin in patients subjected to the quinidine-digoxin interaction. Schenck-Gustafsson K, et al. **Br J Clin Pharmacol** 1981 Feb;11(2):181-6

Electrophysiological effects of the optical isomers of disopyramide and quinidine in the dog. Dependence on stereochemistry. Mirro MJ, et al. **Circ Res** 1981 Jun;48(6 Pt 1):867-74

Effects of contact with vacutainer tube stoppers on the estimation of quinidine in serum and plasma. Ooi DS, et al. **Clin Biochem** 1980 Dec; 13(6):297-300

Serum quinidine concentrations as measured by direct fluorometry, double-extraction fluorometry, and enzyme immunoassay [letter] Batra KK, et al. **Clin Chem** 1981 May;27(5):780-1

Decreased quinidine plasma protein binding during hemodialysis. Kessler KM, et al. **Clin Pharmacol Ther** 1981 Jul;30(1):121-6

Comparison of an enzyme immunoassay and a high performance liquid chromatographic method for quantitation of quinidine in serum. Dextraze PG, et al. **Clin Toxicol** 1981;18(3):291-7

Bioavailability of 11 quinidine formulations adn pharmacokinetic variation in humans. McGilveray IJ, et al. **J Pharm Sci** 1981 May;70(5):524-9

Effects of quinidine on the cardiac-glycoside sensitivity of guinea-pig and rat heart. Kim DH, et al. **J Pharmacol Exp Ther** 1981 Jun; 217(3):559-65

Interactions between quinidine and cardiac glycosides involving mutual binding sites in the guinea pig. Kim DH, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):108-14

Quinidine-rifampin interaction. Twum-Barima Y, et al. **N Engl J Med** 1981 Jun 11;304(24):1466-9

Sodium current depression by lidocaine and quinidine in isolated ventricular cells. Lee KS, et al. **Nature** 1981 May 28; 291(5813):325-7

Quinidine-induced thrombocytopenia. Clark MJ, et al. **Oral Surg** 1981 May;51(5):478-80

The effect of Craviten, a new antiarrhythmic drug, its 2R, 2'R isomer, quinidine and procaine amide on human platelet aggregation. Kędryna T, et al. **Pol J Pharmacol Pharm** 1980 Nov-Dec;32(6):883-8

Digitalis-quinidine interaction [editorial] **S Afr Med J** 1981 May 9; 59(20):695

Digitoxin-quinidine interaction: potentiation during administration of cimetidine. Polish LB, et al. **South Med J** 1981 May;74(5):633-4

[Digitalis and quinidine] Amlie JP. **Tidsskr Nor Laegeforen** 1981 Apr; 101(11):655-7 (Nor)

REACTION TIME

Selective effects of barbiturate and amphetamine on information processing and response execution. Frowein HW. **Acta Psychol (Amst)** 1981 Feb;47(2):105-15

Effect of lithium on reaction time—a study of diurnal variations. Elsass P, et al. **Psychopharmacology (Berlin)** 1981;72(3):279-82

RECEPTORS, ADRENERGIC

Differential beta-adrenergic sensitivity of atrial tissue assessed by chronotropic and inotropic responses to several sympathomimetic amines. Marquez MT, et al. **Acta Physiol Lat Am** 1978; 28(4-5):193-9

Central pre- and postsynaptic monoamine receptors in antidepressant therapy. Svensson TH, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):67-78

Inhibition of renin secretion by intrarenal alpha-adrenoceptor blockade. Blair ML. **Am J Physiol** 1981 Jun;240(6):E682-8

Antidepressants and alpha 2-adrenergic autoreceptor desensitization. Siever LJ, et al. **Am J Psychiatry** 1981 May;138(5):681-2

Receptors, adenylate cyclase, depression, and lithium. Belmaker RH. **Biol Psychiatry** 1981 Apr;16(4):333-50

Type of adrenoceptors involved in induction by adrenaline of hepatic alkaline phosphatase in mice in vivo. Mary PL, et al. **Br J Pharmacol** 1981 Jan;72(1):8-9

Characteristics of the beta 1-and beta 2-adrenergic-sensitive adenylate cyclases in glial cell primary cultures and their comparison with beta 2-adrenergic-sensitive adenylate cyclase of meningeal cells. Ebersolt C, et al. **Brain Res** 1981 May 25;213(1):151-61

Noradrenergic responses in rat hippocampus: evidence for medication by alpha and beta receptors in the in vitro slice. Mueller AL, et al. **Brain Res** 1981 Jun 9;214(1):113-26

alpha 2-Adrenoreceptors in rat brain are decreased after long-term tricyclic antidepressant drug treatment. Smith CB, et al. **Brain Res** 1981 Apr 6;210(1-2):413-8

Reactivation by cysteamine of vascular alpha adrenoceptors blocked by the tetramine disulfide benextramine and interaction of benextramine with phenoxybenzamine. Brasili L, et al. **Can J Physiol Pharmacol** 1980 Dec;58(12):1490-3

Mianserin: direct activation of brain norepinephrine neurons by blocking alpha 2-receptors. Engberg G, et al. **Commun Psychopharmacol** 1980; 4(3):233-9

Stimulation of beta 2-adrenergic responsiveness by follicle-stimulating hormone in rat granulosa cells in vitro and in vivo. Adashi EY, et al. **Endocrinology** 1981 Jun;108(6):2170-8

The role of hypothalamic adrenergic receptors in preventing testosterone-induced androgenization in the female rat brain. Raum WJ, et al. **Endocrinology** 1981 Jul;109(1):273-8

Reversal of noradrenaline denervation-induced increase of beta-adrenoreceptor binding in rat neocortex by noradrenaline infusion. Biswas B, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):341-6

Supersensitivity of central noradrenergic presynaptic autoreceptors following chronic treatment with the antidepressant mianserin. Cerrito F, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):425-6

Involvement of both dopaminergic and alpha-adrenergic receptors in the hypomotility induced by dibenzoyl-6,7-ADTN. Sumners C, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):541-50

Inhibition of phenylephrine-stimulated gluconeogenesis by chlorpromazine is mediated by alpha-adrenergic receptors. Tilley L, et al. **FEBS Lett** 1981 Apr 20;126(2):313-7

Thyroid hormone effects on beta-adrenergic receptors in isolated fat cells in rats. Pfeifle B, et al. **Horm Metab Res** 1981 Apr;13(4):218-21

Regulation of human leukocyte beta receptors by endogenous catecholamines: relationship of leukocyte beta receptor density to the cardiac sensitivity to isoproterenol. Fraser J, et al. **J Clin Invest** 1981 Jun;67(6):1777-84

Selectivity of dobutamine for adrenergic receptor subtypes: in vitro analysis by radioligand binding. Williams RS, et al. **J Clin Invest** 1981 Jun;67(6):1703-11

Individually reared rats: alteration in noradrenergic brain functions. Kraeuchi K, et al. **J Neural Transm** 1981;50(2-4):103-12

Affinity of butriptyline and other tricyclic antidepressants for alpha-adrenoceptor binding sites in rat brain. Pugsley TA, et al. **J Pharm Pharmacol** 1981 Feb;33(2):113-5

Effects of chronic reserpine administration on beta adrenergic receptors, adenylate cyclase and phosphodiesterase of the rat submandibular gland. Bylund DB, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):134-41

Comparison of the receptors mediating the catecholamine hyperpolarization and slow inhibitory postsynaptic potential in sympathetic ganglia. Cole AE, et al. **J Pharmacol Exp Ther** 1981 May; 217(2):440-4

Prenatal exposure to imipramine alters early behavioral development and beta adrenergic receptors in rats. Jason KM, et al. **J Pharmacol Exp Ther** 1981 May;217(2):461-6

DPI, a supposed selective agonist of inhibitory dopamine receptors, strongly increases rat diuresis through alpha-adrenergic receptor activation. Baggio G, et al. **Life Sci** 1981 Mar 30;28(13):1449-56

II. Beta-adrenergic receptors and catecholamine sensitive adenylate cyclase in the developing rat lung. Whitsett JA, et al. **Life Sci** 1981 Jan 26;28(4):339-45

Response of white adipocyte of mouse and rabbit to catecholamines and ACTH. 3. Modified binding properties of beta-adrenoreceptor and its decreased coupling efficiency for adenylate cyclase. Fan CC, et al. **Mol Cell Biochem** 1981 Jan 20;34(1):51-8

Subsensitivity of the beta-adrenergic receptor-linked adenylate cyclase system of rat pineal gland following repeated treatment with desmethylimipramine and nialamide. Moyer JA, et al. **Mol Pharmacol** 1981 Mar;19(2):187-93

Acceleration of beta-receptor desensitization in combined administration of antidepressants and phenoxybenzamine. Crews FT, et al. **Nature** 1981 Apr 30;290(5809):787-9

A pharmacological method to estimate the pKi of competitive inhibitors of agonist uptake processes in isolated tissues. Kenakin TP. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):89-95

Effects of some membrane perturbers on alpha 1-adrenergic receptor binding. Ciofalo FR. **Neurosci Lett** 1981 Feb 6;21(3):313-8

Differential effect of chronic desipramine and amitriptyline treatment on rat brain adrenergic and serotonergic receptors. Tang SW, et al. **Psychiatry Res** 1981 Apr;4(2):129-38

Drug regimens facilitating aggression: behavior, amine, and receptor alterations [proceedings] Eichelman B. **Psychopharmacol Bull** 1981 Jan; 17(1):58-60

Effects of propranolol on the locomotor stimulation induced by activation of postsynaptic catecholamine receptors. Hallberg H, et al. **Psychopharmacology (Berlin)** 1981;73(3):227-31

Electrophysiological changes at a central noradrenergic synapse during thallium toxicosis. Marwaha J, et al. **Toxicol Appl Pharmacol** 1980 Dec; 56(3):345-52

[Beta-adrenergic receptors and paradoxical sleep in the rat] Lanfumey L, et al. **C R Acad Sci [D] (Paris)** 1981 Mar 2;292(9):645-7 (Eng. Abstr.) (Fre)

RECEPTORS, CHOLINERGIC

Correlation between cholinergic histamine release and quinuclidinyl-benzilate ([3H]-QNB) binding in mast cell membranes. Masini E, et al. **Agents Actions** 1981 Apr;11(1-2):55-9

Reconstitution of acetylcholine receptor function using purified receptor protein. Wu WC, et al. **Biochemistry** 1981 Feb 17;20(4):[illegible]94-701

A comparison of stereospecificity at central and peripheral 'muscarine-sensitive' acetylcholine receptors: observations with the enantiomeric forms of procyclidine and tricyclamol. Barlow RB, et al. **Br J Pharmacol** 1981 Feb;72(2):277-80

5-hydroxytryptamine controls ACh-receptor sensitivity of bullfrog sympathetic ganglion cells. Akasu T, et al. **Brain Res** 1981 Apr 27; 211(1):217-20

Maintenance and dissolution of acetylcholine receptor clusters in the embryonic muscle cell membrane. Orida N, et al. **Brain Res** 1981 Apr; 227(2):293-8

Potentiation and inhibition of nicotinic effects on striated muscle by the tetramine disulfide benextramine. Benfey BG, et al. **Can J Physiol Pharmacol** 1980 Aug;58(8):984-8

Reflexly induced inhibition of catecholamine release through a peripheral muscarinic mechanism. Lavallée M, et al. **Can J Physiol Pharmacol** 1980 Nov;58(11):1334-41

Baclofen modifies via the release of monoamines the synaptic depression, frequency facilitation, and posttetanic potentiation observed at an identified cholinergic synapse of Aplysia californica. Philippe E, et al. **Can J Physiol Pharmacol** 1981 Mar;59(3):244-52

Altered ontogenesis of muscarinic cholinergic receptor in mouse brain: effect of L-thyroxine and betamethasone. Ben-Baruch G, et al. **Endocrinology** 1981 Jul;109(1):235-9

Secoverine selectively antagonizes muscarinic effects in various in vivo preparations. Zwagemakers JM, et al. **Eur J Pharmacol** 1981 Apr 24; 71(1):165-8

Stabilization of acetylcholine receptor channels by lipids in cholate solution and during reconstitution in vesicles. Anholt R, et al. **J Biol Chem** 1981 May 10;256(9):4377-87

Acetylcholine receptor kinetics. Adams PR. **J Membr Biol** 1981 Feb 26; 58(3):161-74 (132 ref.)

Acetylcholine receptor-controlled ion flux in electroplax membrane vesicles: identification and characterization of membrane properties that affect ion flux measurements. Kim PS, et al. **J Membr Biol** 1981 Feb 28;58(3):203-11

Molecular requirements of the active site of cholinergic receptors XV: Synthesis and biological activity of 2,3-dehydrodeoxamuscarone and 2,3-dehydrodeoxamuscarines. Angeli P, et al. **J Pharm Sci** 1981 May; 70(5):489-92

An enhanced sensitivity of muscarinic cholinergic receptor associated with dopaminergic receptor subsensitivity after chronic antidepressant treatment. Koide T, et al. **Life Sci** 1981 Mar 9;28(10):1139-45

The identification of an invertebrate acetylcholine receptor. Thomas WE, et al. **Life Sci** 1981 Mar 2;28(9):965-71 (42 ref.)

Does rigidity in structure of muscarinic agonists and antagonists reflect drug specificity? Fisher A, et al. **Monogr Neural Sci** 1980;7:41-54

Pre- and postsynaptic effects of muscarinic agonists in the guinea-pig ileum. Kilbinger H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):259-66

Choline inhibits acetylcholine release via presynaptic muscarine receptors. Kilbinger H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr; 316(2):131-4

Comparison of the antimuscarinic activity of mianserin and amitriptyline in the cat superior cervical ganglion. Kwok YH, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr;316(2):161-4

The Yawning elicited by alpha-melanocyte-stimulating hormone involves serotonergic-dopaminergic-cholinergic neuron link in rats. Yamada K, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr; 316(2):155-60

Circadian acetylcholine receptor rhythm in rat brain and its modification by imipramine. Kafka MS, et al. **Neuropharmacology** 1981 May; 20(5):421-5

The time course of the muscarinic response to ionophoretic acetylcholine application to the S-A node of the rabbit heart. Osterrieder W, et al. **Pfluegers Arch** 1981 Mar;389(3):283-91

[3H]Phencyclidine: a probe for the ionic channel of the nicotinic receptor. Eldefrawi ME, et al. **Proc Natl Acad Sci USA** 1980 Dec; 77(12):7458-62

Pirenzepine--a ligand with original binding properties to muscarinic receptors. Birdsall NJ, et al. **Scand J Gastroenterol [Suppl]** 1980; 15(66):1-4

RECEPTORS, DOPAMINE

Electroconvulsive therapy and receptor sensitivity. Modigh K, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):91-9

The relationship between loss of dopamine nerve terminals, striatal [3H]spiroperidol binding and rotational behavior in unilaterally 6-hydroxydopamine-lesioned rats. Heikkila RE, et al. **Brain Res** 1981 May 4;211(2):285-92

Dopamine receptor changes following destruction of the nigrostriatal pathway: lack of a relationship to rotational behavior. Staunton DA, et al. **Brain Res** 1981 May 4;211(2):315-27

A dopaminergic binding site in the high speed supernatant of steer anterior pituitary homogenates. Kerdelhue B, et al. **Endocrinology** 1981 Jul; 109(1):307-9

Solubilization of neuroleptic/dopamine receptors of human brain striatum. Davis A, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):321-9

Kainate lesion dissociates striatal dopamine receptor radioligand binding sites. Leff S, et al. **Eur J Pharmacol** 1981 Mar 5;70(1):71-5

Involvement of both dopaminergic and alpha-adrenergic receptors in the hypomotility induced by dibenzoyl-6,7-ADTN. Sumners C, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):541-50

D2- but not D3-dopamine receptors detected in the anterior pituitary. Titeler M, et al. **Eur J Pharmacol** 1981 Apr 24;71(1):143-6

A comparison of dopamine receptor blocking assay with plasma drug levels of haloperidol in schizophrenic patients. Kurland AA, et al. **J Clin Pharmacol** 1981 Jan;21(1):42-7

Prolonged dopamine receptor blockade in rats after termination of long-term depot fluphenazine [letter] Waddington JL, et al. **Lancet** 1981 Jun 20;1(8234):1375-6

Dopamine receptors in rat frontal cortex: pharmacological properties in vivo and in vitro. Bacopoulos NG, et al. **Life Sci** 1980 Dec 22-29; 27(25-26):2489-94

DPI, a supposed selective agonist of inhibitory dopamine receptors, strongly increases rat diuresis through alpha-adrenergic receptor activation. Baggio G, et al. **Life Sci** 1981 Mar 30;28(13):1449-56

Neostriatal dopamine receptor loss and behavioral deficits in the senescent rat. Cubells JF, et al. **Life Sci** 1981 Mar 16;28(11):1215-8

3-PPP, a new centrally acting DA-receptor agonist with selectivity for autoreceptors. Hjorth S, et al. **Life Sci** 1981 Mar 16;28(11):1225-38

An enhanced sensitivity of muscarinic cholinergic receptor associated with dopaminergic receptor subsensitivity after chronic antidepressant treatment. Koide T, et al. **Life Sci** 1981 Mar 9;28(10):1139-45

Chronic neuroleptic treatment specifically alters the number of dopamine receptors in rat brain. Theodorou A, et al. **Life Sci** 1981 Apr 6; 28(14):1621-7

Mesocortical dopamine neurons. Lack of autoreceptors modulating dopamine synthesis. Bannon MJ, et al. **Mol Pharmacol** 1981 Mar; 19(2):270-5

The Yawning elicited by alpha-melanocyte-stimulating hormone involves serotonergic-dopaminergic-cholinergic neuron link in rats. Yamada K, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr; 316(2):155-60

Response of striatonigral substance P systems to a dopamine receptor agonist and antagonist. Hanson G, et al. **Neuropharmacology** 1981 Jun; 20(6):541-8

Blink rates and receptor supersensitivity. Karson CN, et al. **Neuropharmacology** 1981 Jan;20(1):91-3

Binding of [3H]sulpiride to purified rat striatal synaptic membranes. Woodruff GN, et al. **Neuroscience** 1981;6(3):407-10

Evidence for dopamine mediation of submissive gestures in the stumptail macaque monkey. Schlemmer RF Jr, et al. **Pharmacol Biochem Behav** 1981;14 Suppl 1:95-102

Tonic immobility in domestic fowl: possible interaction of serotonergic and dopaminergic mechanisms. Wallnau LB, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):469-73

Resolution of dopamine and serotonin receptor components of [3H]spiperone binding to rat brain regions. List SJ, et al. **Proc Natl Acad Sci USA** 1981 Apr;78(4):2620-4

Repeated antidepressant treatments induce a long-lasting dopamine autoreceptor subsensitivity: is daily treatment necessary for clinical efficacy? [proceedings] Antelman SM, et al. **Psychopharmacol Bull** 1981 Jan;17(1):92-4

Long-term d-amphetamine in rats: lack of change in post-synaptic dopamine receptor sensitivity. Jackson DM, et al. **Psychopharmacology (Berlin)** 1981;73(3):276-80

The effects of electroconvulsive shock on the discriminative stimulus properties of d-amphetamine and apomorphine: evidence for dopamine receptor alteration subsequent ECS. White DK, et al. **Psychopharmacology (Berlin)** 1981;73(3):211-4

The effects of acrylamide treatment upon the dopamine receptor. Agrawal AK, et al. **Toxicol Appl Pharmacol** 1981 Mar 30;58(1):89-99

Effects of acrylamide given during gestation on dopamine receptor binding in rat pups. Agrawal AK, et al. **Toxicol Lett** 1981 Jan; 7(3):233-8

3,4,3',4'-Tetrachlorobiphenyl given to mice prenatally produces long-term decreases in striatal dopamine and receptor binding sites in the caudate nucleus. Agrawal AK, et al. **Toxicol Lett** 1981 Mar; 7(6):417-24

[Neurophysiologic and pharmacologic evidence of autoregulationin the nigrostriatal system] Arushanian EB, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):133-6 (Eng. Abstr.) **(Rus)**

RECEPTORS, DRUG

Receptor adaptations to centrally acting drugs. Creese I, et al. **Annu Rev Pharmacol Toxicol** 1981;21:357-91 (235 ref.)

The benzodiazepine--GABA--chloride ionophore receptor complex: common site of minor tranquilizer action. Paul SM, et al. **Biol Psychiatry** 1981 Mar;16(3):213-29

Kainic acid-induced lesion of rat retina: differential effect on cyclic GMP and benzodiazepine and GABA receptors. Guarneri P, et al. **Brain Res** 1981 Mar 23;209(1):216-20

The insensitivity of developing benzodiazepine receptors to chronic treatment with diazepam, GABA and muscimol in brain cell cultures. Shibla DB, et al. **Brain Res** 1981 Apr 6;210(1-2):471-4

gamma-Aminobutyric acid regulation of the benzodiazepine receptor: biochemical evidence for pharmacologically different effects of benzodiazepines and propyl beta-carboline-3-carboxylate. Ehlert FJ, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):593-5

Increase of benzodiazepine binding to the membranes isolated in the presence of diazepam. Korneyev AY, et al. **Eur J Pharmacol** 1981 Apr 24;71(1):127-30

Tolerance during chronic benzodiazepine treatment associated with decreased receptor binding. Rosenberg HC, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):453-60

Specific high-affinity saturable binding of [3H] R05-4864 to benzodiazepine binding sites in the rat cerebral cortex. Schoemaker H, et al. **Eur J Pharmacol** 1981 Apr 24;71(1):173-5

Molecular sizes of benzodiazepine receptors and the interacting GABA receptors in the membrane are identical. Chang LR, et al. **FEBS Lett** 1981 Apr 20;126(2):309-12

Purification of phenytoin-binding site from the brain. Imazawa M, et al. **Folia Psychiatr Neurol Jpn** 1980;34(3):362

Effect of picrotoxin on benzodiazepine receptors and GABA receptors with reference to the effect of Cl- ion. Fujimoto M, et al. **Life Sci** 1981 Feb 23;28(8):895-901

Modulation by picrotoxin and IPTBO of 3H-flunitrazepam binding to the GABA/benzodiazepine receptor complex of rat cerebellum. Karobath M, et al. **Life Sci** 1981 Jan 19;28(3):307-13

Multiple benzodiazepine receptors: evidence of dissociation between anticonflict and anticonvulsant properties by PK 8165 and PK 9084 (two quinoline derivatives). Le Fur G, et al. **Life Sci** 1981 Mar 30; 28(13):1439-48

Do benzodiazepines bind at adenosine uptake sites in CNS? Wu PH, et al. **Life Sci** 1981 Mar 2;28(9):1023-31

Benzodiazepine receptor: heterogeneity in rabbit brain. Yokoi I, et al. **Life Sci** 1981 Apr 6;28(14):1591-5

Increase in 3H-flunitrazepam binding in vitro and in vivo to rat brain benzodiazepine receptors by tofizopam, a 3,4-benzo-diazepine. Saano V, et al. **Pharmacol Res Commun** 1981 Jan;13(1):75-85

gamma-Aminobutyric acid and benzodiazepine receptors: copurification and characterization. Gavish M, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1939-42

Autoradiographic localization of benzodiazepine receptors in immunocytochemically identified gamma-aminobutyrergic synapses. Möhler H, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1935-8

Localized binding of [3H]muscimol to synapses in chicken retina. Yazulla S, et al. **Proc Natl Acad Sci USA** 1981 Jan;78(1):643-7

RECEPTORS, ENDORPHIN

Proposals for conformation of enkephalins related to opiate mu-pharmacophore. Maigret B, et al. **Biochem Biophys Res Commun** 1981 Mar 16;99(1):267-74

ACTH1-24 blocks opiate - induced analgesia in the rat. Smock T, et al. **Brain Res** 1981 May 11;212(1):202-6

The interaction of N alpha-alkylenkephalins with opiate receptors.

Tissue-dependent shifts in the opiate activity of methionine-enkephalin following N alpha-alkylation. Summers MC, et al. **J Biol Chem** 1981 May 25;256(10):4951-6

Comparative study on the effect of morphine and the opioid-like peptides in the vas deferens of rodents: species and strain differences, evidence for multiple opiate receptors. Huidobro-Toro JP, et al. **Life Sci** 1981 Mar 23;28(12):1331-6

Affinity of beta-carbolines on rat brain benzodiazepine and opiate binding sites. Airaksinen MM, et al. **Med Biol** 1980 Dec;58(6):341-4

Opiate receptors modulate LHRH and SRIF release from mediobasal hypothalamic neurons. Drouva SV, et al. **Neuroendocrinology** 1981 Mar; 32(3):163-7

A cyclic enkephalin analog with high in vitro opiate activity. DiMaio J, et al. **Proc Natl Acad Sci USA** 1980 Dec;77(12):7162-6

RECEPTORS, HORMONE

Changes of receptor cooperation in Tetrahymena by re-exposure to hormones. Csaba G, et al. **Acta Biol Acad Sci Hung** 1980; 31(1-3):43-7

Mucosal gastrin receptor. VI. Induction by corticosterone in newborn rats. Peitsch W, et al. **Am J Physiol** 1981 Jun;240(6):G442-9

Human placental receptors for luteinizing hormone releasing hormone. Currie AJ, et al. **Biochem Biophys Res Commun** 1981 Mar 16; 99(1):332-8

GABA receptor pharmacology. Functional considerations. Enna SJ. **Biochem Pharmacol** 1981 May 1;30(9):907-13

The benzodiazepine--GABA--chloride ionophore receptor complex: common site of minor tranquilizer action. Paul SM, et al. **Biol Psychiatry** 1981 Mar;16(3):213-29

Relationship between the presence of dopaminergic neurons and GABA receptors in substantia nigra: effects of lesions. Gale K. **Brain Res** 1981 Apr 6;210(1-2):401-6

Kainic acid-induced lesion of rat retina: differential effect on cyclic GMP and benzodiazepine and GABA receptors. Guarneri P, et al. **Brain Res** 1981 Mar 23;209(1):216-20

Heterogeneous depression of glucose utilization in the caudate nucleus by GABA agonists. Kelly PA, et al. **Brain Res** 1981 Mar 30; 209(2):458-63

Effects of halopemide on GABA receptor binding, uptake and release. Loonen AJ, et al. **Brain Res** 1981 Apr 6;210(1-2):485-92

Neurotensin receptor localization by light microscopic autoradiography in rat brain. Young WS 3d, et al. **Brain Res** 1981 Feb 16; 206(2):273-85

A simple, inexpensive filtration device suitable for neurotransmitter receptor binding studies in brain tissue. Wilkinson M, et al. **Can J Physiol Pharmacol** 1981 May;59(5):504-6

Binding characteristics of gonadotropin-releasing hormone receptors throughout the estrous cycle of the hamster. Adams TE, et al. **Endocrinology** 1981 Jun;108(6):2245-53

Pituitary and gonadal gonadotropin-releasing hormone receptors during sexual maturation in the rat. Dalkin AC, et al. **Endocrinology** 1981 May; 108(5):1658-64

Dissociated changes of pituitary luteinizing hormone-releasing hormone (LHRH) receptors and responsiveness to the neurohormone induced by 17 beta-estradiol and LHRH in vivo in the rat. Ferland L, et al. **Endocrinology** 1981 Jul;109(1):87-93

Regulation of adrenal and testicular prolactin receptors by adrenocorticotropin and luteinizing hormone. Katikineni M, et al. **Endocrinology** 1981 Jun;108(6):2367-74

Effects of antidepressant drugs on different receptors in the brain. Hall H, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):393-407

Prolactin inhibits the induction of its own renal receptors in Rana catesbeiana tadpoles. White BA, et al. **Gen Comp Endocrinol** 1981 Jan; 43(1):30-8

Benzodiazepines, barbiturates and baclofen interaction within the GABA-receptors. Azanza MJ. **Gen Pharmacol** 1981;12(3):123-8 (20 ref.)

Absence of LH-RH binding sites in corpora lutea from rhesus monkeys (Macacca mulatta). Asch RH, et al. **J Clin Endocrinol Metab** 1981 Jul; 53(1):215-17

Effect of picrotoxin on benzodiazepine receptors and GABA receptors with reference to the effect of Cl- ion. Fujimoto M, et al. **Life Sci** 1981 Feb 23;28(8):895-901

Effect of prolactin and prostaglandins on the stimulation of prolactin binding sites in the male rat liver. Barkey RJ, et al. **Mol Cell Endocrinol** 1981 Feb;21(2):129-38

Sertoli-Leydig cell communication via an LHRH-like factor. Sharpe RM, et al. **Nature** 1981 Apr 30;290(5809):785-7

Preparation of 3H-[3-M3-His2]TRH as an improved ligand for TRH receptors. Taylor RL, et al. **Neuroendocrinology** 1981 May; 32(5):310-6

Effects of anticonvulsants on excitability and GABA sensitivity of cat dorsal root ganglion cells. Gallagher JP, et al. **Neuropharmacology** 1981 May;20(5):427-33

Pentobarbitone slows the dissociation of GABA from rat brain synaptosomal binding sites. Willow M, et al. **Neurosci Lett** 1981 Apr 9;23(1):71-4

Neurotransmitter receptors in brain regions of acrylamide- treated rats. I: Effects of a single exposure to acrylamide. Agrawal AK, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):527-31

Neurotransmitter receptors in brain regions of acrylamide- treated rats. II: Effects of extended exposure to acrylamide. Bondy SC, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):533-7

gamma-Aminobutyric acid and benzodiazepine receptors: copurification and characterization. Gavish M, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1939-42

[Regulation of genetic activity by thyroid hormones. II. Specificity of interaction of cytoplasmic thyroxine receptor isolated from human embryonal fibroblasts and HeLa cells with DNA] Abdukarimov A, et al. **Probl Endokrinol (Mosk)** 1981 Mar-Apr;27(2):66-70 (Eng. Abstr.) **(Rus)**

[Regulation of genetic activity by thyroid hormones. Effect of purified cytoplasmic hormone-receptor complex on the chromatin template activity] Abdukarimov A, et al. **Probl Endokrinol (Mosk)** 1981 Jan-Feb; 27(1):50-3 (Eng. Abstr.) **(Rus)**

RECEPTORS, SEROTONIN

Central pre- and postsynaptic monoamine receptors in antidepressant therapy. Svensson TH, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):67-78

5-Hydroxytryptamine induces relaxation of goat pulmonary veins: evidence for the noninvolvement of M and D-tryptamine receptors. Chand N. **Br J Pharmacol** 1981 Feb;72(2):233-7

Synaptic remodeling of serotonin axon terminals in rat agranular cerebellum. Beaudet A, et al. **Brain Res** 1981 Feb 16;206(2):305-29

Serotonin-receptor-mediated modulation of Ca2+-dependent 5-hydroxytryptamine release from neurones of the rat brain cortex. Göthert M. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov; 314(3):223-30

The Yawning elicited by alpha-melanocyte-stimulating hormone involves serotonergic-dopaminergic-cholinergic neuron link in rats. Yamada K, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Apr; 316(2):155-60

Treatment with trazodone plus phenoxybenzamine accelerates development of decreased type 2 serotonin binding in rat cortex. Taylor DP, et al. **Neuropharmacology** 1981 May;20(5):513-6

Antidepressants and serotonin neurons of the raphe. Constantinidis J, et al. **Neuropsychobiology** 1981;7(3):113-21

DOM and related 2,5-dimethoxy-4-alkylphenylisopropylamines: behavioral and serotonin receptor properties. Glennon RA, et al. **Pharmacol Biochem Behav** 1981 Mar;14(3):287-92

The effects of tryptophan and manipulations of serotonergic receptors on tonic immobility in chickens. Wallnau LB, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):463-8

Tonic immobility in domestic fowl: possible interaction of serotonergic and dopaminergic mechanisms. Wallnau LB, et al. **Pharmacol Biochem Behav** 1981 Apr;14(4):469-73

Lipid fluidity markedly modulates the binding of serotonin to mouse brain membranes. Heron DS, et al. **Proc Natl Acad Sci USA** 1980 Dec; 77(12):7463-7

Resolution of dopamine and serotonin receptor components of [3H]spiperone binding to rat brain regions. List SJ, et al. **Proc Natl Acad Sci USA** 1981 Apr;78(4):2620-4

Evidence that it is possible to cause anorexia by increasing release and/or directly stimulating postsynaptic serotonin receptors in the brain. Samanin R, et al. **Prog Neuropsychopharmacol** 1980;4(4-5):363-9

Differential effect of chronic desipramine and amitriptyline treatment on rat brain adrenergic and serotonergic receptors. Tang SW, et al. **Psychiatry Res** 1981 Apr;4(2):129-38

Effect of 5,7-dihydroxytryptamine on serotonergic control of prolactin secretion and behavior in rats. Kuhn CM, et al. **Psychopharmacology (Berlin)** 1981;73(2):188-93

Two distinct central serotonin receptors with different physiological functions. Peroutka SJ, et al. **Science** 1981 May 15;212(4496):827-9

[Interaction of indoleamines with serotonergic receptors of brain synaptosomes] Uzbekov MG, et al. **Biokhimiia** 1980 Jan;45(1):109-12 (Eng. Abstr.) **(Rus)**

REFLEX

Sensitization of the perioral biting reflex by intranigral GABA agonist after detelencephalization. Weizl H, et al. **Neurosci Lett** 1981 Feb 6; 21(3):351-4

[Studies on voiding mechanism. 2. The effects of urethral distension on the vesical contraction reflex: neuropharmacological and neurophysiological aspects (author's transl)] Bekku T. **Nippon Hinyokika Gakkai Zasshi** 1980 Dec;71(12):1456-71 (Eng. Abstr.) **(Jpn)**

REINFORCEMENT (PSYCHOLOGY)

Fixed-ratio responding under second-order schedules of food presentation or cocaine injection. Goldberg SR, et al. **J Pharmacol Exp Ther** 1981

Jul;218(1):271-81

Comparison of discriminative and reinforcing effects of ketamine and related compounds in the rhesus monkey. Young AM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(34):173-9

Dopaminergic mediation of reward: evidence gained using a natural reinforcer in a behavioral contrast paradigm. Royall DR, et al. **Neurosci Lett** 1981 Jan 20;21(2):223-9

Effects of chlorpromazine on food-maintained and observing behavior. Dearing ME, et al. **Psychopharmacology (Berlin)** 1981;73(3):281-5

The partial reinforcement extinction effect after treatment with chlordiazepoxide. Feldon J, et al. **Psychopharmacology (Berlin)** 1981; 73(3):269-75

REINFORCEMENT SCHEDULE

Effects of diazepam on schedule-controlled and schedule-induced behavior under signaled and unsignaled shock. Hymowitz N. **J Exp Anal Behav** 1981 Jul;36(1):119-32

The pituitary-adrenal response to 'minimized' schedule-induced drinking. Brett LP, et al. **Physiol Behav** 1981 Feb;26(2):153-8

RESERPINE

Terminals of reserpine-sensitive vasopressin-neurophysin neurons in the external layer of the rat median eminence. Seybold V, et al. **Endocrinology** 1981 May;108(5).1803-9

Influence of phenothiazines or reserpine on the formation of 14C-glycine from U-14C-serine. Gründig E, et al. **Enzyme** 1981;26(1):43-8

Role of monoamines in behavior of reserpinized rats given tranylcypromine stereoisomers. Smith DF. **J Neural Transm** 1981; 50(2-4):193-200

Chronic reserpine treatment alters sensitivity and membrane potential of the rabbit saphenous artery. Abel PW, et al. **J Pharmacol Exp Ther** 1981 May;217(2):430-9

Effects of chronic reserpine administration on beta adrenergic receptors, adenylate cyclase and phosphodiesterase of the rat submandibular gland. Bylund DB, et al. **J Pharmacol Exp Ther** 1981 Jul;218(1):134-41

Effects of reserpine on monoamines and intestinal transit in the rat. Stewart JJ, et al. **J Pharmacol Exp Ther** 1981 May;217(2):357-62

Reserpine increases opiate-like peptide content and tyrosine hydroxylase activity in adrenal medullary chromaffin cells in culture. Wilson SP, et al. **Neuroscience** 1981;6(1):71-9

Effect of 5-hydroxytryptamine on isolated aortic strip preparations obtained from untreated and reserpine treated rabbits. Tayyaba B, et al. **Planta Med** 1981 Mar;41(3):295-7

[Effect of reserpine on monoamine uptake by rat brain synaptosomes] Blaschke M, et al. **Acta Biol Med Ger** 1980;39(11-12):1205-12 (Eng. Abstr.) **(Ger)**

[Influence of the central dopaminergic system on GABAergic activity of the cerebellum. Initial results] Di Giorgio RM, et al. **Acta Neurol (Napoli)** 1981 Feb;36(1):302-4 (Eng. Abstr.) **(Ita)**

[Hormonal induction of lactation after short-term treatment in sheep. III.] Manunta G, et al. **Boll Soc Ital Biol Sper** 1981 Jan 30;57(2):165-71 (Eng. Abstr.) **(Ita)**

[Induction of lactation in cattle after short-term hormonal treatment] Manunta G, et al. **Boll Soc Ital Biol Sper** 1981 Jan 30;57(2):172-8 (Eng. Abstr.) **(Ita)**

[The effect of reserpine on the morphine abstinence syndrome in mice (author's transl)] Kruszewska A, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979;34:133-9 **(Pol)**

[Effect of reserpine on O- and N-demethylase activity in the liver of rats (author's transl)] Božeková L, et al. **Bratisl Lek Listy** 1981 Feb; 75(2):161-6 (Eng. Abstr.) **(Slo)**

RUBIDIUM

Is ouabain-sensitive rubidium or potassium uptake a measure of sodium pump activity in isolated cardiac muscle? Akera T, et al. **Biochim Biophys Acta** 1981 Feb 6;640(3):779-90

Relationship between the positive inotropic effect of ouabain and its inhibitory effects on Na+, K+ -ATPase and active transport of Rb+ in the dog heart. Rhee HM, et al. **Eur J Pharmacol** 1981 Mar 26; 70(3):273-8

Further studies on the precipitative freeze dissolution technique for the localization of inorganic ions. Van Iren F, et al. **Histochemistry** 1981; 71(2):195-201

Sodium and rubidium uptake in cells transformed by Rous sarcoma virus. Bader JP, et al. **J Cell Physiol** 1981 Feb;106(2):235-43

The effect of pH on 86Rubidium efflux from pancreatic islet cells. Henquin JC. **Mol Cell Endocrinol** 1981 Feb;21(2):119-28

K+ channels close more slowly in the presence of external K+ and Rb+. Swenson RP Jr, et al. **Nature** 1981 Jun 4;291(5814):427-9

SCHIZOPHRENIA

Haloperidol and droperidol treatment in schizophrenics. Clinical application of the 'prolactin-model'. Langer G, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):574-83

Late (4-8 years) outcome of treatment with megadoses of fluphenazine enanthate in drug-refractory schizophrenics. Dencker SJ, et al. **Acta Psychiatr Scand** 1981 Jan;63(1):1-12

DL-propranolol and chlorpromazine following admission for schizophrenia. A controlled comparison. Yorkston NJ, et al. **Acta Psychiatr Scand** 1981 Jan;63(1):13-27

The need for long-term neuroleptic treatment in schizophrenia. Dencker SJ. **Acta Psychiatr Scand [Suppl]** 1981;63(291):29-43

The role of neuroleptics in an integrated treatment program for chronic schizophrenics. Gottfries I, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(291):44-55

High doses of clorotepin in chronic schizophrenia (preliminary report). Bastecký J, et al. **Agressologie** 1980;21(A):31-5

Neuroleptic-induced decrease in platelet MAO activity of schizophrenic patients. Chojnacki M, et al. **Am J Psychiatry** 1981 Jun; 138(6):838-40

Attitudes toward medication change among chronically impaired psychiatric patients. Lesser IM, et al. **Am J Psychiatry** 1981 Jun; 138(6):801-3

Dialysis for schizophrenia: an uncontrolled study of 11 patients. Scheiber SC, et al. **Am J Psychiatry** 1981 May;138(5):662-5

Increased whole blood serotonin concentrations in chronic schizophrenic patients. DeLisi LE, et al. **Arch Gen Psychiatry** 1981 Jun; 38(6):647-50

Blood tryptophan metabolism in chronic schizophrenics. Freedman DX, et al. **Arch Gen Psychiatry** 1981 Jun;38(6):655-9

Relapse in schizophrenia [letter] Goldhamer P. **Arch Gen Psychiatry** 1981 Jul;38(7):842-3

Schizophrenia. A follow-up study of the results of five forms of treatment. May PR, et al. **Arch Gen Psychiatry** 1981 Jul;38(7):776-84

Brain monoamine oxidase activity in schizophrenics and controls. Reveley MA, et al. **Arch Gen Psychiatry** 1981 Jun;38(6):663-5

Outcome and risks of ultra-long-term treatment with an oral neuroleptic drug. Relationship between perazine serum levels and clinical variables in schizophrenic outpatients. Pietzcker A, et al. **Arch Psychiatr Nervenkr** 1981;229(4):315-29

Piperidine in chronic schizophrenic patients: a controlled double-blind study. Luchins DJ, et al. **Biol Psychiatry** 1981 Jan;16(1):91-5

The reliability of 5-hydroxytryptamine induced platelet aggregation responses in schizophrenic patients treated with neuroleptic drugs. Knox JM, et al. **Br J Clin Pharmacol** 1981 Mar;11(3):261-3

The effects of neuroleptic drugs on 5-hydroxytryptamine induced platelet aggregation in schizophrenic patients. Orr MW, et al. **Br J Clin Pharmacol** 1981 Mar;11(3):255-9

Controlled trial of sulpiride in chronic schizophrenic patients. Edwards JG, et al. **Br J Psychiatry** 1980 Dec;137:522-9

Schizophrenia. Pyke J, et al. **Can Nurse** 1981 May;77(5):39-43

Plasma DBH activity: relation to genetic factors in schizophrenia. Baron M, et al. **Commun Psychopharmacol** 1980;4(3):197-202

Effect of propranolol treatment on serum prolactin level in schizophrenic patients. Elizur A, et al. **Commun Psychopharmacol** 1980;4(3):203-6

Prognosis in schizophrenia: individual differences in psychological response to a test dose of antipsychotic drug and their relationship to blood and saliva levels and treatment outcome. May PR, et al. **Compr Psychiatry** 1981 Mar-Apr;22(2):147-52

Clopenthixol decanoate in schizophrenia. Carney MW, et al. **Curr Med Res Opin** 1981;7(4):205-11

Plasma dopamine beta hydroxylase activity in chronic schizophrenic patients tested with single dose of 2-bromo-alpha ergocriptine (Parlodel). Vardi J, et al. **Encephale** 1981;7(1):95-103

With onions and tears: a multidimensional analysis of a counter-ritual. Levick SE, et al. **Fam Process** 1981 Mar;20(1):77-83

Benzodiazepines in schizophrenia: a need for reassessment. Nestoros JN. **Int Pharmacopsychiatry** 1980;15(3):171-9

A comparison of dopamine receptor blocking assay with plasma drug levels of haloperidol in schizophrenic patients. Kurland AA, et al. **J Clin Pharmacol** 1981 Jan;21(1):42-7

Viloxazine and the depressed schizophrenic—methodological issues. Kurland AA, et al. **J Clin Pharmacol** 1981 Jan;21(1):37-41

Pharmacomanometric studies of colonic motility as a guide to the chemotherapy of schizophrenia. Lechin F, et al. **J Clin Pharmacol** 1980 Nov-Dec;20(11-12):664-71

A comparative study of parenteral molindone and haloperidol in the acutely psychotic patient. Binder R, et al. **J Clin Psychiatry** 1981 May; 42(5):203-6

Thiothixene plasma levels and clinical response in acute schizophrenia. Reifler BV, et al. **J Clin Psychiatry** 1981 May;42(5):207-11

Levels of HIAA and VMA in C.S.F. of schizophrenics before and after treatment. Okasha A, et al. **J Egypt Med Assoc** 1978; 61(Suppl 1-2):38-50

Autonomous prolactin secretion in schizophrenic male on long-term neuroleptic therapy [letter] Semple CG, et al. **Lancet** 1981 Jul 11; 2(8237):103

An alternative mechanism of actions for neuroleptic and antidepressant drugs. Randall PL. **Med Hypotheses** 1981 Feb;7(2):251-60

Hemodialysis in schizophrenia: psychiatric aspects of treatment failure in a pilot study. Rorsman B, et al. **Neuropsychobiology** 1981; 7(3):127-36

Dextro-propranolol in schizophrenia. Hirsch SR, et al. **Prog Neuropsychopharmacol** 1980;4(6):633-7

Genetics and schizophrenic behavior. Kahn E. **Psychiatr Q** 1980 Winter; 52(4):251-69 (124 ref.)

A probable neuroleptic effect on platelet monoamine oxidase in chronic schizophrenic patients. DeLisi LE, et al. **Psychiatry Res** 1981 Feb; 4(1):95-107

Nongenetic factors affecting human platelet monoamine oxidase [proceedings] Friedhoff AJ, et al. **Psychopharmacol Bull** 1981 Jan; 17(1):101-3

Natural and therapeutic environmental indicators of maintenance dosage requirements [proceedings] Hogarty GE. **Psychopharmacol Bull** 1981 Jan;17(1):36-7

Plasma levels of chlorpromazine and clinical response [proceedings] van Putten T, et al. **Psychopharmacol Bull** 1981 Jan;17(1):113-5

A double-blind comparison of trebenzomine and thioridazine in the treatment of schizophrenia. Georgotas A, et al. **Psychopharmacology (Berlin)** 1981;73(3):292-4

Neuroendocrine tests during treatment with neuroleptic drugs: I. Plasma prolactin response to chlorpromazine challenge. Kolakowska T, et al. **Psychopharmacology (Berlin)** 1981;72(3):283-5

A clinical and pharmacodynamic evaluation of sulpiride. Rao VA, et al. **Psychopharmacology (Berlin)** 1981;73(1):77-80

Serum and CSF levels of haloperidol by radioimmunoassay and radioreceptor assay during high-dose therapy of resistant schizophrenic patients. Rimón R, et al. **Psychopharmacology (Berlin)** 1981; 73(2):197-9

[Preliminary observations on immunoglobulins in schizophrenics (author's transl)] Huo KJ. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1979; 12(3):161-3 (Chi)

[A study of renovation rate of dopamine and 5-hydroxytryptamine in brain in chronic schizophrenics (author's transl)] Shen YC. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1979;12(3):158-60 (Chi)

[Modifications of cerebral amine metabolism in psychiatric illness] Linkowski P, et al. **Acta Psychiatr Belg** 1980 Sep-Oct;80(5):559-73 (38 ref.) (Fre)

[Relation of pharmacotherapy, regulation of life situations and analytically-oriented psychotherapy in schizophrenic psychoses under the conditions of an ambulatory psychiatric practice] Schmidt P. **Agressologie** 1980;21(A):27-9 (Eng. Abstr.) (Ger)

[Neurochemistry and clinical psychiatry (author's transl)] Gross G. **Fortschr Neurol Psychiatr** 1981 Jan;49(1):34-42 (Eng. Abstr.) (Ger)

[The course of schizophrenic psychoses treated with neuroleptics] Rüther E, et al. **MMW** 1981 May 8;123(19):803-4 (Ger)

[Modification of long-term schizophrenia by somato-therapeutic measures] Gross G, et al. **Psychiatr Clin (Basel)** 1980;13(3-4):179-92 (Eng. Abstr.) (Ger)

[Modification of schizophrenia by intensive neuroleptic therapy and the course of the disease after withdrawal of neuroleptic drugs] Steiner S. **Psychiatr Clin (Basel)** 1980;13(3-4):165-78 (Eng. Abstr.) (Ger)

[Peculiarities and difficulties in the systematic drug therapy of chronic schizophrenics (schizophrenic 'defect')] Lange E, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1981 Jan;33(1):34-8 (Eng. Abstr.) (Ger)

[Biochemical approach to schizophrenia] Lipcsey A. **Orv Hetil** 1980 Nov 23;121(47):2863-70 (Hun)

[Effectiveness of treating early-onset malignant schizophrenia with psychotropic drugs and their combinations] Sobolev ES, et al. **Zh Nevropatol Psikhiatr** 1981;81(1):114-21 (Eng. Abstr.) (Rus)

SCHIZOPHRENIA, DISORGANIZED

[Amineptine and amotival syndrome (author's transl)] Deniker P, et al. **Encephale** 1981;7(1):59-64 (Eng. Abstr.) (Fre)

SCHIZOPHRENIA, PARANOID

Paranoid schizophrenia. A serpent which licked my eyes... Hansford M. **Nurs Mirror** 1981 May 7;152(19):30-3

SELF STIMULATION

The central basis of motivation: intracranial self-stimulation studies. Olds ME, et al. **Annu Rev Psychol** 1981;32:523-74 (246 ref.)

Reward and detection thresholds for brain stimulation: dissociative effects of cocaine. Kornetsky C, et al. **Brain Res** 1981 Mar 30; 209(2):496-500

Intracranial self-stimulation: mapping against the lateral boundaries of the dopaminergic cells of the substantia nigra. Wise RA. **Brain Res** 1981 May 25;213(1):190-4

Self-stimulation and locomotor changes indicating 'latent' anticholinergic activity by an atypical neuroleptic (thioridazine). Herberg LJ, et al. **Neuropharmacology** 1981 Jan;20(1):55-60

Intravenous self-administration of nomifensine in rats: implications for abuse potential in humans. Spyraki C, et al. **Science** 1981 Jun 5; 212(4499):1167-8

SENSORY DEPRIVATION

Role of intracortical inhibition in deprivation amblyopia: reversal by microiontophoretic bicuculline. Burchfiel JL, et al. **Brain Res** 1981 Feb 16;206(2):479-84

Cortical effects of monocular deprivation: suppression or deafferentation? [news] Movshon JA. **Nature** 1981 May 28;291(5813):284-5

The role of GABAergic inhibition in the cortical effects of monocular deprivation. Sillito AM, et al. **Nature** 1981 May 28;291(5813):318-20

SEROTONIN

Reversed effect of chlorpromazine on hypothalamic serotonin levels of rats with complete deafferentation of the medial basal hypothalamus. Bánky Z, et al. **Acta Biol Acad Sci Hung** 1980;31(1-3):25-32

Enhancement of the sensitivity of Tetrahymena to a second hormonal influence by hormone pretreatment. Csaba G, et al. **Acta Biol Med Ger** 1980;39(10):1027-30

Effect of epinephrine and 5-hydroxytryptamine on in vitro thyroid iodine organification. Masini-Repiso AM, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):207-12

Stimulation by serum of aldosterone production from rat adrenal glomerulosa cells in vitro: relationships to K+, serotonin and angiotensin II. Mendelsohn FA, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):231-42

Immunohistochemical characterization of monoamine-containing neurons in the central nervous system by antibodies to serotonin and noradrenalin. A study in the rat and the lamprey (Lampetra fluviatilis). Steinbusch HW, et al. **Acta Histochem [Suppl] (Jena)** 1981;24:107-22

Effect of prolonged acetylcholinesterase inhibition on postnatal brain development in rabbit. I. Level of serotonin in different brain regions. Maślińska D, et al. **Acta Neuropathol [Suppl] (Berl)** 1981;7:52-5

The action of antidepressant drugs on 5-hydroxy-tryptamine uptake by platelets—relationship to therapeutic effect. Coppen A, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):236-43

Pre- and postsynaptic effects of zimelidine and norzimelidine on the serotoninergic system: single cell studies in the rat. de Montigny C, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):79-90

The pharmacology of zimelidine: a 5-HT selective reuptake inhibitor. Ogren SO, et al. **Acta Psychiatr Scand [Suppl]** 1981; 63(Suppl 290):127-51

Specific norepinephrine and serotonin uptake inhibitors in man: a crossover study with pharmacokinetic, biochemical, neuroendocrine and behavioral parameters. Potter WZ, et al. **Acta Psychiatr Scand [Suppl]** 1981;63(Suppl 290):152-65

A simple, specific, radioenzymatic assay for picogram quantities of serotonin or acetylserotonin in biological fluids and tissues. Hussain MN, et al. **Anal Biochem** 1981 Feb;111(1):105-10

Morphology, histochemistry, and distribution of serotonin-containing cells in tracheal epithelium of adult rabbit. Dey RD, et al. **Anat Rec** 1981 Jan;199(1):23-31

Evidence for the involvement of serotoninergic system in the male-induced ovo-implantation failure (Bruce effect) in mice. Sahu SC, et al. **Ann Endocrinol (Paris)** 1980 Sep-Oct;41(5):425-9

Increased whole blood serotonin concentrations in chronic schizophrenic patients. DeLisi LE, et al. **Arch Gen Psychiatry** 1981 Jun; 38(6):647-50

Short-term and repetitive administration of oral tryptophan in normal men. Effects on blood tryptophan, serotonin, and kynurenine concentrations. Yuwiler A, et al. **Arch Gen Psychiatry** 1981 Jun; 38(6):619-26

Effects of Ro 11-2465, a new psychotropic agent on the uptake of serotonin by human platelets—in vitro determination of the IC50. Lenehan T, et al. **Arch Int Pharmacodyn Ther** 1981 Jan; 249(1):147-52

Distribution of the radioactivity in the central nervous system of the developing rat following intracisternal or subcutaneous administration of 14C-5,7-dihydroxytryptamine. Sievers J, et al. **Bibl Anat** 1981; (19):302-7

Induction of serotonin secretion by cross-linking of surface receptors of a derivative of wheat germ agglutinin on human platelets. Ganguly P, et al. **Biochem Biophys Res Commun** 1981 Mar 16;99(1):176-82

2-nitroimipramine: a selective irreversible inhibitor of [3H] serotonin uptake and [3H] imipramine binding in platelets. Rehavi M, et al. **Biochem Biophys Res Commun** 1981 Apr 15;99(3):954-9

The effect of ouabain on the release of 5-hydroxytryptamine from superfused synaptosomes. Collard KJ, et al. **Biochem Soc Trans** 1981 Feb;9(1):109-10

Plasma free and total tryptophan, blood serotonin, and the hyperactivity syndrome: no evidence for the serotonin deficiency hypothesis. Ferguson HB, et al. **Biol Psychiatry** 1981 Mar;16(3):231-8

Management of depression with serotonin precursors. van Praag HM. **Biol Psychiatry** 1981 Mar;16(3):291-310

The reliability of 5-hydroxytryptamine induced platelet aggregation responses in schizophrenic patients treated with neuroleptic drugs. Knox JM, et al. **Br J Clin Pharmacol** 1981 Mar;11(3):261-3

The effects of neuroleptic drugs on 5-hydroxytryptamine induced platelet aggregation in schizophrenic patients. Orr MW, et al. **Br J Clin Pharmacol** 1981 Mar;11(3):255-9

Differential effect of benserazide (Ro4-4602) on the concentration of indoleamines in rat pineal and hypothalamus. Arendt J, et al. **Br J Pharmacol** 1981 Feb;72(2):257-62

Effect of hyperoxia on uptake and metabolism of 5-hydroxytryptamine and beta-phenylethylamine in rat lung: a sex difference. Ben-Harari RR, et al. **Br J Pharmacol** 1981 Jun;73(2):461-6

5-Hydroxytryptamine induces relaxation of goat pulmonary veins: evidence for the noninvolvement of M and D-tryptamine receptors. Chand N. **Br J Pharmacol** 1981 Feb;72(2):233-7

In vivo pharmacological studies on the interactions between tryptamine and 5-hydroxytryptamine. Jones RS. **Br J Pharmacol** 1981 Jun;73(2):485-93

Further studies on 5-hydroxytryptamine transport in pancreatic islets and isolated beta-cells. Lindström P. **Br J Pharmacol** 1981 Jun;73(2):385-91

5-hydroxytryptamine controls ACh-receptor sensitivity of bullfrog sympathetic ganglion cells. Akasu T, et al. **Brain Res** 1981 Apr 27;211(1):217-20

Synaptic remodeling of serotonin axon terminals in rat agranular cerebellum. Beaudet A, et al. **Brain Res** 1981 Feb 16;206(2):305-29

Serotonergic and peptidergic projections to the spinal cord demonstrated by a combined retrograde HRP histochemical and immunocytochemical staining method. Bowker RM, et al. **Brain Res** 1981 May 4;211(2):412-7

Serotonergic projections from the ventral medulla to the intermediolateral cell column in the rat. Loewy AD, et al. **Brain Res** 1981 Apr 27;211(1):146-52

Apparent serotonergic modulation of the dose-dependent biphasic response of neostriatal neurons produced by D-amphetamine. Rebec GV, et al. **Brain Res** 1981 Apr 6;210(1-2):277-89

Serotonin-immunoreactive cells in the superior cervical ganglion of the rat. Evidence for the existence of separate serotonin- and catecholamine-containing small ganglionic cells. Verhofstad AA, et al. **Brain Res** 1981 May 11;212(1):39-49

Evidence of the modulatory role of serotonin in acetylcholine release from striatal interneurons. Vizi ES, et al. **Brain Res** 1981 May 11;212(1):89-99

Morphine analgesia and newly synthesized 5-hydroxytryptamine in the dorsal and the ventral halves of the spinal cord of the rat. Weil-Fugazza J, et al. **Brain Res** 1981 Jun 15;214(2):440-4

The identification of serotonergic neurons in the nucleus raphe magnus by conduction velocity. Wessendorf MW, et al. **Brain Res** 1981 Jun 9;214(1):168-73

Contractile effects of 5-hydroxytryptamine in isolated intrapulmonary arteries and veins. Gruetter CA, et al. **Can J Physiol Pharmacol** 1981 Feb;59(2):157-62

Different influences of two types of diets commonly used for rats on a series of parameters related to the metabolism of central serotonin and noradrenaline. Héroux O, et al. **Can J Physiol Pharmacol** 1981 Feb;59(2):108-12

Location and release of TRH and 5-HT from amphibian skin. Bennett GW, et al. **Cell Biol Int Rep** 1981 Feb;5(2):151-8

The selective inhibition of serotonin-induced contractions of rabbit cerebral vascular smooth muscle by calcium-antagonistic dihydropyridines. An investigation of the mechanism of action of nimodipine. Towart R. **Circ Res** 1981 May;48(5):650-7

Liquid-chromatographic determination of serotonin and tryptophan in whole blood and plasma [letter] Anderson GM, et al. **Clin Chem** 1981 May;27(5):775-6

A modified assay method for determining serotonin uptake in human platelets. Arora RC, et al. **Clin Chim Acta** 1981 May 5;112(2):225-33

Effects of hormones on the RNA-synthesis of Tetrahymena pyriformis. Csaba G, et al. **Comp Biochem Physiol [C]** 1981;68C(2):251-3

Blood-brain barrier for serotonin in the eel (Anguilla anguilla L.). Genot G, et al. **Comp Biochem Physiol [C]** 1981;68C(2):247-50

Serotonin stimulates thyrotropin-releasing hormone release from superfused rats hypothalami. Chen YF, et al. **Endocrinology** 1981 Jun;108(6):2359-66

A serotonergic mechanism of the prolactin-stimulating action of metoclopramide. Fang VS, et al. **Endocrinology** 1981 May;108(5):1622-7

Dopamine in hypophysial portal plasma and prolactin in systemic plasma of rats treated with 5-hydroxytryptamine. Pilotte NS, et al. **Endocrinology** 1981 Jun;108(6):2137-41

Brain serotonin turnover correlates inversely with plasma adrenocorticotropin during the triphasic response to adrenalectomy in rats. Van Loon GR, et al. **Endocrinology** 1981 Jun;108(6):2269-76

Simultaneous determination of femtomole quantities of 5-hydroxytryptophan, serotonin and 5-hydroxyindoleacetic acid in brain using HPLC with electrochemical detection. Lacković Z, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):347-52

Differential effects of clomipramine and clorgyline on the sensitivity of cortical neurons to serotonin: effect of chronic treatment. Olpe HR. **Eur J Pharmacol** 1981 Jan 29;69(3):375-7

Relative activities of substances related to 5-hydroxytryptamine as depolarizing agents of superior cervical ganglion cells. Wallis D, et al. **Eur J Pharmacol** 1981 Mar 26;70(3):381-92

Blood pressure responses to local application of serotonergic agents in the nucleus tractus solitarii. Wolf WA, et al. **Eur J Pharmacol** 1981 Jan 29;69(3):291-9

Long-term effects of a tryptophan-free diet on serotonin metabolism and sleep-waking balance in rats. Lanoir J, et al. **Exp Brain Res** 1981;41(3-4):346-57

Competition between platelets and lung for 5-hydroxytryptamine uptake. Steinberg H, et al. **Exp Lung Res** 1980 Jun;1(2):121-30

Effect of monoamines on firing rate and thermal sensitivity of neurons in the preoptic area of awake rabbits. Gordon CJ, et al. **Exp Neurol** 1981 May;72(2):352-65

A biphasic effect of estradiol on serotonin metabolism in rat pineal organ cultures. Cardinali DP, et al. **Experientia** 1981 Feb 15;37(2):203-4

Serum serotonin, free tryptophan and plasma cyclic AMP levels in autistic children -with special reference to their relation to hyperkinesia. Hoshino Y, et al. **Fukushima J Med Sci** 1979;26(3-4):79-91

Rates of indoleamine synthesis in maturing mouse brain. Baker PC, et al. **Gen Pharmacol** 1981;12(3):151-4

Proton: substrate stoichiometries during active transport of biogenic amines in chromaffin ghosts. Johnson RG, et al. **J Biol Chem** 1981 Jun 10;256(11):5773-80

Amine transport in chromaffin granule ghosts. pH dependence implies cationic form is translocated. Knoth J, et al. **J Biol Chem** 1981 Jul 10;256(13):6541-3

Separation of dissociated thyroid follicular and parafollicular cells: association of serotonin binding protein with parafollicular cells. Bernd P, et al. **J Cell Biol** 1981 Mar;88(3):499-508

The organization of indoleamine neurons in the brain of the rhesus monkey (Macaca mulatta). Schofield SP, et al. **J Comp Neurol** 1981 Apr 10;197(3):369-83

Altered sensitivity to footshock after selective serotonin depletion: comparison of electrolytic lesions and neurotoxin injections in the medial forebrain bundle of the rat. Simansky KJ, et al. **J Comp Physiol Psychol** 1981 Apr;95(2):341-50

Further investigations on Bernard-Soulier platelet abnormalities. Rendu F, et al. **J Lab Clin Med** 1981 May;97(5):689-99

Effect of L-tryptophan on mouse brain 5-hydroxytryptamine: comparison of values obtained using a fluorimetric assay and a liquid Chromatographic assay with electrochemical detection. Marsden CA. **J Neurochem** 1981 May;36(5):1621-6

Application of high performance liquid chromatography with electrochemical detection to neurochemical analysis: measurement of catecholamines, serotonin and metabolites in rat brain. Mefford IN. **J Neurosci Methods** 1981 Feb;3(3):207-24 (47 ref.)

Evidence for a presynaptic inhibitory action of 5-hydroxytryptamine in a mammalian sympathetic ganglion. Dun NJ, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):714-8

The effects of p-chloroamphetamine administration on locomotor activity and serotonin in neonatal and adult rats. Lucot JB, et al. **J Pharmacol Exp Ther** 1981 Jun;217(3):738-44

Effect of progesterone therapy on the responses of the isolated rat stomach fundus strip preparations to 5-hydroxytryptamine and acetylcholine. Qayum A, et al. **JPMA** 1981 Apr;31(4):84-8

The effect of 5-hydroxytryptamine on the slow inward current of bullfrog atrium. Tokimasa T. **Jpn Heart J** 1981 Mar;22(2):227-37

Effect of imipramine on central 5-hydroxytryptamine turnover and metabolism in rats. Segawa T, et al. **Jpn J Pharmacol** 1980 Dec;30(6):789-93

Effect of serotonin on uterine blood flow in pregnant and nonpregnant sheep. Clark KE, et al. **Life Sci** 1980 Dec 22-29;27(25-26):2655-61

Disruption of 5-hydroxytryptaminergic neuronal function blocks the action of morphine on tuberoinfundibular dopaminergic neurons. Demarest KT, et al. **Life Sci** 1981 Mar 23;28(12):1345-51

Mechanism of stimulation of cardiac myocyte beating rate by 5-hydroxytryptamine. Higgins TJ, et al. **Life Sci** 1981 Mar 2;28(9):999-1005

The effect of morphine on the content of serotonin, 5-hydroxyindole acetic acid and substance-P in the nuclei raphe magnus and reticularis gigantocellularis. Lakoski JM, et al. **Life Sci** 1980 Dec 22-29;27(25-26):2639-44

Role of cyclic AMP in a serotonin-evoked slow inward current in snail neurones. Deterre P, et al. **Nature** 1981 Apr 30;290(5809):783-5

Brain serotonin and 5-hydroxyindoleacetic acid concentrations and serotonin synthesis following tetrahydro-beta-carboline administration in mice. Buckholtz NS. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):215-21

Serotonin-receptor-mediated modulation of Ca2+-dependent 5-hydroxytryptamine release from neurones of the rat brain cortex.

Göthert M. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov; 314(3):223-30

Persistence of circadian rhythms of melatonin and N-acetylserotonin in the serum of rats after pinealectomy. Yu HS, et al. **Neuroendocrinology** 1981 May;32(5):262-5

Monoamine uptake into synaptosomes from various regions of rat brain following lithium administration and withdrawal. Ahluwalia P, et al. **Neuropharmacology** 1981 May;20(5):483-7

Similar motor effects of 5-HT and TRH in rats following chronic spinal transection and 5.7-dihydroxytryptamine injection. Barbeau H, et al. **Neuropharmacology** 1981 May;20(5):477-81

Effects of phenytoin on mouse cerebellar 5-hydroxytryptamine and norepinephrine. Fry BW, et al. **Neuropharmacology** 1981 Jun; 20(6):623-5

Injections of dopaminergic, cholinergic, serotoninergic and GABAergic drugs into the nucleus accumbens: effects on locomotor activity in the rat. Jones DL, et al. **Neuropharmacology** 1981 Jan;20(1):29-37

The functional importance of increased brain tryptophan in the serotonergic response to restraint stress. Kennett GA, et al. **Neuropharmacology** 1981 Jan;20(1):39-43

A diurnal rhythm of N-acetylserotonin in the retina of rats. Pang SF, et al. **Neurosci Lett** 1981 Jan 20;21(2):197-200

Organization of ascending serotonin systems in the adult rat brain. A radioautographic study after intraventricular administration of [3H]5-hydroxytryptamine. Parent A, et al. **Neuroscience** 1981; 6(2):115-38

Distribution of serotonin-immunoreactivity in the central nervous system of the rat-cell bodies and terminals. Steinbusch HW. **Neuroscience** 1981; 6(4):557-618

Involvement of serotonin and catecholamine metabolism in cats trained to perform a delayed response task. Vachon L, et al. **Neuroscience** 1981; 6(2):189-94

The effect of tryptolines (1, 2, 3, 4-tetrahydro-beta-carbolines) on monoamine metabolism and the platelet aggregation response in human platelets. Youdim MB, et al. **Neuroscience** 1981;6(4):801-10

Central 5-hydroxytryptamine and the effects of hallucinogens and phenobarbital on operant responding in rats. Commissaris RL, et al. **Pharmacol Biochem Behav** 1981 May;14(5):595-601

Tryptophan deprivation: effects on mouse-killing and reactivity in the rat. Vergnes M, et al. **Pharmacol Biochem Behav** 1981; 14 Suppl 1:19-23

Effect of immobilization and of elevation of the 5-hydroxytryptamine concentrations in the brain stem on liver tryptophan pyrrolase activity in a hibernator [the golden hamster]. Novotná R. **Physiol Bohemoslov** 1981;30(1):27-33

Lipid fluidity markedly modulates the binding of serotonin to mouse brain membranes. Heron DS, et al. **Proc Natl Acad Sci USA** 1980 Dec; 77(12):7463-7

NMR studies of 5-hydroxytryptamine transport through large unilamellar vesicle membranes. Viscio DB, et al. **Proc Natl Acad Sci USA** 1981 Mar;78(3):1638-42

Serotonin involvement in the regulation of gonadotropin secretion during lactation in the rat. Coppings RJ, et al. **Proc Soc Exp Biol Med** 1981 Apr;166(4):536-41

Evidence that it is possible to cause anorexia by increasing release and/or directly stimulating postsynaptic serotonin receptors in the brain. Samanin R, et al. **Prog Neuropsychopharmacol** 1980;4(4-5):363-9

Monoamine theories of sleep: the role of serotonin—a review [proceedings] Morgane PJ. **Psychopharmacol Bull** 1981 Jan; 17(1):13-7 (27 ref.)

Studies on the role of serotonin in avoidance learning [proceedings] Ogren SO. **Psychopharmacol Bull** 1981 Jan;17(1):17-9

Increased brain serotonergic and noradrenergic activity after repeated systemic administration of the beta-2 adrenoceptor agonist salbutamol, a putative antidepressant drug. Hallberg H, et al. **Psychopharmacology (Berlin)** 1981;73(3):201-4

Lesion of serotonergic neurons antagonizes clonidine induced suppression of avoidance behavior and locomotor activity in rats. Kostowski W, et al. **Psychopharmacology (Berlin)** 1981;73(3):261-4

Catecholamine-serotonin interaction effects on activity in rats neonatally treated with 6-hydroxydopamine. Olds ME, et al. **Psychopharmacology (Berlin)** 1981;73(1):31-3

Peripheral correlates of serotonergically-influenced behaviors in vervet monkeys (Cercopithecus aethiops sabaeus). Raleigh MJ, et al. **Psychopharmacology (Berlin)** 1981;72(3):241-6

The effects of d-amphetamine and potassium on serotonin release and metabolism in rat cerebral cortex tissue. Homan HD, et al. **Res Commun Chem Pathol Pharmacol** 1981 Feb;31(2):223-40

Prolonged stimulation of respiration by endogenous central serotonin. Millhorn DE, et al. **Respir Physiol** 1980 Dec;42(3):171-88

Two pools of amines in synaptic vesicles of rat pineal nerves. Pellegrino de Iraldi A, et al. **Rev Can Biol** 1981 Mar;40(1):101-9

Binding of 5-hydroxytryptamine to brain hydrophobic proteins. Inhibition by structural analogues and ions. Cabello FM. **Rev Esp Fisiol** 1980 Dec; 36(4):409-12

Some characteristics of mouse platelet aggregation and a comparison of the activity of a range of compounds in mouse and human platelet-rich plasma in vitro. Nunn B. **Thromb Haemost** 1981 Feb 23;45(1):1-5

Platelet-foreign surface interactions: the release reaction from singly adherent platelets and adherent platelet aggregates. Whicher SJ, et al. **Trans Am Soc Artif Intern Organs** 1980;26:268-73

[A study of renovation rate of dopamine and 5-hydroxytryptamine in brain in chronic schizophrenics (author's transl)] Shen YC. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1979;12(3):158-60 **(Chi)**

SEX BEHAVIOR, ANIMAL

Effects of cannabinoids and female exposure on the pituitary-testicular axis in mice: possible involvement of prostaglandins. Dalterio S, et al. **Biol Reprod** 1981 Mar;24(2):315-22

Bisexual behavior in male rats treated neonatally with antibodies to luteinizing hormone-releasing hormone. Kalcheim C, et al. **J Comp Physiol Psychol** 1981 Feb;95(1):36-44

Delta-9-Tetrahydrocannabinol stimulates receptive and proceptive sexual behaviors in female hamsters. Turley WA Jr, et al. **Pharmacol Biochem Behav** 1981 May;14(5):745-7

[The influence of oxazepam and diazepam on the sexual behaviour and level of GABA biogenic amines in a male rat's brain (author's transl)] Borzęcki Z, et al. **Ann Univ Mariae Curie Sklodowska [Med]** 1979; 34:371-6 (Eng. Abstr.) **(Pol)**

SLEEP

Effect of cannabidiol on cytochrome P-450 and hexobarbital sleep time. Bornheim LM, et al. **Biochem Pharmacol** 1981 Mar 1;30(5):503-7

The effect of p-bromomethamphetamine (V-111) on sleep on the rat. Juvancz P. **Eur J Pharmacol** 1981 Apr 9;70(4):461-6

Phasic hippocampal activity during paradoxical sleep in the rat: selective suppression after diazepam administration. Monmaur P. **Experientia** 1981 Mar 15;37(3):261-2

Bromocriptine, dihydroergotoxine and sleep in rats: effects of repeated administration. Radulovacki M, et al. **Gerontology** 1981;27(3):152-7

Enhancement of hexobarbital-induced sleep by lysine and its metabolites. Chang YF, et al. **Life Sci** 1981 Jan 26;28(4):407-13

Monoamine theories of sleep: the role of serotonin—a review [proceedings] Morgane PJ. **Psychopharmacol Bull** 1981 Jan; 17(1):13-7 (27 ref.)

SLEEP DEPRIVATION

Circadian variations in cardiovascular parameters during sleep deprivation. A noninvasive study of young healthy men. Ahnve S, et al. **Eur J Applied Physiol** 1981;46(1):9-19

Changes of response to dopaminergic drugs in rats submitted to REM-sleep deprivation. Tufik S. **Psychopharmacology (Berlin)** 1981; 72(3):257-60

SLEEP, REM

Phenoxybenzamine and bromocriptine attenuate need for REM sleep in rats. Radulovacki M, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):371-5

Changes of response to dopaminergic drugs in rats submitted to REM-sleep deprivation. Tufik S. **Psychopharmacology (Berlin)** 1981; 72(3):257-60

[Beta-adrenergic receptors and paradoxical sleep in the rat] Lanfumey L, et al. **C R Acad Sci [D] (Paris)** 1981 Mar 2;292(9):645-7 (Eng. Abstr.) **(Fre)**

SLEEP STAGES

Effect of p-chlorophenylalanine and tryptophan on sleep, EEG and motor activity in the rat. Borbély AA, et al. **Behav Brain Res** 1981 Jan; 2(1):1-22

Long-term effects of a tryptophan-free diet on serotonin metabolism and sleep-waking balance in rats. Lanoir J, et al. **Exp Brain Res** 1981; 41(3-4):346-57

Diurnal rhythm of plasma immunoreactive beta-endorphin and its relationship to sleep stages and plasma rhythms of cortisol and prolactin. Dent RR, et al. **J Clin Endocrinol Metab** 1981 May;52(5):942-7

SODIUM

Role of calcium and sodium in strophanthidin inotropy in cardiac Purkinje fibers. Bhattacharyya ML, et al. **Am J Physiol** 1981 Apr; 240(4):H561-70

Sodium-calcium interactions in the renal proximal convoluted tubule of the rabbit. Friedman PA, et al. **Am J Physiol** 1981 Jun; 240(6):F558-68

Role of cyclic GMP in cholinergic activation of Na-K pump in duck salt gland. Stewart DJ, et al. **Am J Physiol** 1981 May; 240(5):C207-14

Is ouabain-sensitive rubidium or potassium uptake a measure of sodium pump activity in isolated cardiac muscle? Akera T, et al. **Biochim Biophys Acta** 1981 Feb 6;640(3):779-90

Permeability of reconstituted sarcoplasmic reticulum vesicles. Reconstitution of the K+, Na+ channel. Young RC, et al. **Biomembranes** 1981 Jan 22;640(2):409-18

Further evidence for the involvement of Na+ channels in the release of adrenal catecholamine: the effect of scorpion venom and grayanotoxin I. Ito S, et al. **Br J Pharmacol** 1981 Jan;72(1):61-7

Exocytotic secretion of catecholamines from the cat adrenal medulla by sodium deprivation: involvement of calcium influx mechanism. Nishimura S, et al. **Br J Pharmacol** 1981 Feb;72(2):305-17

Possible occurrence of Na+-dependent Ca2+ influx mechanism in isolated bovine chromaffin cells. Sorimachi M, et al. **Brain Res** 1981 Mar 16;208(2):442-6

Release of noradrenaline from the rat tail artery induced by inhibition of the sodium pump in calcium-free solution. Palatý V. **Can J Physiol Pharmacol** 1981 Apr;59(4):347-50

Melittin stimulates Na entry, Na-K pump activity and DNA synthesis in quiescent cultures of mouse cells. Rozengurt E, et al. **Cell** 1981 Mar; 23(3):781-8

Effects of cations on brown adipose tissue in relation to possible metabolic consequences of membrane depolarisation. Nedergaard J. **Eur J Biochem** 1981;114(1):159-67

Jejunal water and electrolyte secretion induced by L-arginine in man. Hegarty JE, et al. **Gut** 1981 Feb;22(2):108-13

Human fetal membranes: investigations on membrane potentials and membrane 24Na permeability in vitro and the possible involvement of acetylcholine. Welsch F. **Gynecol Obstet Invest** 1981;12(3):113-22

Sodium and rubidium uptake in cells transformed by Rous sarcoma virus. Bader JP, et al. **J Cell Physiol** 1981 Feb;106(2):235-43

Mechanisms for the effects of acetylcholine on sodium transport in frog skin. Cuthbert AW, et al. **J Membr Biol** 1981 Mar 15;59(1):65-75

Avid Na+-dependent, high-affinity uptake of alpha-ketoglutarate by nerve terminal enriched material from mouse cerebellum. Shank RP, et al. **Life Sci** 1981 Feb 23;28(8):843-50

Effect of monovalent cations on the aggregation of tobacco mosaic virus by chondroitin sulfate. Sano Y, et al. **Microbiol Immunol** 1981; 25(2):155-61

Sodium current depression by lidocaine and quinidine in isolated ventricular cells. Lee KS, et al. **Nature** 1981 May 28; 291(5813):325-7

[Relation between renal hemodynamic parameters and urinary concentrations of sodium and solutes suggestive of various methods of controlling renal function] Agnoli GC, et al. **Boll Soc Ital Biol Sper** 1981 Feb 28;57(4):442-8 (Eng. Abstr.) **(Ita)**

[Mechanisms of the renal action of dopamine and their dependence on changes in the sodium balance. II. Studies on water-salt depletion] Agnoli GC, et al. **Boll Soc Ital Cardiol** 1979;24(12):1331-49 **(Ita)**

[Mechanisms of the renal action of dopamine and thier dependence on changes in sodium balance. Studies on water-salt retention] Agnoli GC, et al. **Boll Soc Ital Cardiol** 1979;24(12):1315-29 **(Ita)**

SOMATOTROPIN RELEASE INHIBITING HORMONE

Rate of thymidine incorporation and incidence of parenchymal cell division in adult rat hypophyseal cell cultures. Effect of thyroliberin and somatostatin. Rappay G, et al. **Acta Biol Acad Sci Hung** 1980; 31(1-3):249-55

Effect of somatostatin on regional splanchnic blood flows in man. Angiographic studies. Samnegård H, et al. **Acta Chir Scand [Suppl]** 1980; Suppl 500:71-3

Effect of intraluminal pH on the release of somatostatin and gastrin into antral, bulbar and ileal pouches of conscious dogs. Uvnäs-Wallensten K, et al. **Acta Physiol Scand** 1980 Dec;110(4):391-400

Effect of D-Val1, D-Trp8-somatostatin on the motility of the stomach, duodenum and jejunum. Chernish SM, et al. **Am J Gastroenterol** 1981 Jan;75(1):36-40

Release of somatostatin from rodent antral mucosae maintained in organ culture. Lichtenberger LM, et al. **Am J Physiol** 1981 Jul; 241(1):G59-66

Four hormones in the pancreas of the lizard, Anolis carolinensis. Rhoten WB, et al. **Anat Rec** 1981 Jan;199(1):89-97

Lack of effect of somatostatin on the glucagon-induced alterations of hepatic metabolism of [1-14C]oleate. Weinstein I, et al. **Biochim Biophys Acta** 1981 Apr 23;664(1):124-32

Glucagon action upon plasma post-heparin lipolytic and monoglyceride hydrolase activities. Studies involving administration of exogenous hormone during suppression of endogenous hormone secretion with somatostatin. de Basilico MZ, et al. **Biomedicine** 1980 Nov; 33(7):213-6

Somatostatin-28, somatostatin-14 and somatostatin analogs: effects on thermoregulation. Brown M, et al. **Brain Res** 1981 Jun 9; 214(1):127-35

Somatostatin in the auditory system of the rat. Takatsuki K, et al. **Brain Res** 1981 May 25;213(1):211-6

Gastric inhibitory polypeptide stimulated secretion of somatostatinlike immunoreactivity from the stomach: inhibition by acetylcholine or vagal stimulation. McIntosh CH, et al. **Can J Physiol Pharmacol** 1981 May; 59(5):468-72

Synthesis of a glycotripeptide and a glycosomatostatin containing the 3-O-(2-acetamido-2-deoxy-beta-D-glucopyranosyl)-L-serine residue. Lavielle S, et al. **Carbohydr Res** 1981 Mar 2;89(2):229-36

Solid-phase synthesis of two glycopeptides containing the amino acid sequence 5 to 9 of somatostatin. Lavielle S, et al. **Carbohydr Res** 1981 Mar 2;89(2):221-8

The origin of somatostatin fibers in the median eminence and neural lobe of Rana temporaria. Dierickx K, et al. **Cell Tissue Res** 1981; 215(1):41-5

Nerves containing substance P, vasoactive intestinal polypeptide, enkephalin or somatostatin in the guinea-pig taenia coli. Distribution, ultrastructure and possible functions. Leander S, et al. **Cell Tissue Res** 1981;215(1):21-39

Evidence for somatostatin, gastrin and pancreatic polypeptide-like substances in the mucosa cells of the gut in fishes with and without stomach. Noaillac-Depeyre J, et al. **Cell Tissue Res** 1981; 216(1):193-203

Simple extraction method and radioimmunoassay for somatostatin in human plasma. Peeters TL, et al. **Clin Chem** 1981 Jun;27(6):888-91

Altered ability of the liver to produce glucose following a period of glucagon deficiency. Deri JJ, et al. **Diabetes** 1981 Jun;30(6):490-5

Effect of somatostatin on the flow rate and triglyceride levels of thoracic duct lymph in normal and vagotomized dogs. Nakabayashi H, et al. **Diabetes** 1981 May;30(5):440-5

Previous exposure to glucose enhances somatostatin secretion from the isolated perfused rat pancreas. Grill V, et al. **Diabetologia** 1981 Apr; 20(4):495-500

Effect of a new hypoglycaemic agent (HB 699) on the in vivo secretion of pancreatic hormones in the dog. Ribes G, et al. **Diabetologia** 1981 Apr;20(4):501-5

Possible involvement of the cholinergic system in hormonal secretion by the perfused pancreas from ventromedial-hypothalamic lesioned rats. Rohner-Jeanrenaud F, et al. **Diabetologia** 1981 Mar;20(3):217-22

Autonomic function and control of pancreatic somatostatin. Samols E, et al. **Diabetologia** 1981 Mar;20 Suppl:388-92

The effect of somatostatin on bombesin-stimulated serum gastrin and gastric acid secretion in man. Jansen JB, et al. **Digestion** 1981; 21(4):193-7

Use of the mouse vas deferens assay to evaluate the action of somatostatin peptides on gastric acid secretion. Meyers CA, et al. **Digestion** 1981; 21(1):21-4

Effect of somatostatin and calcium deprivation on cholecystokinin or caerulein-induced insulin and glucagon release from the isolated perfused rat pancreas. Otsuki M, et al. **Endocrinol Jpn** 1980 Dec; 27 Suppl 1:95-102

Effect of somatostatin on blood levels of motilin and the interdigestive myoelectric complex in dogs. Poitras P, et al. **Endocrinol Jpn** 1980 Dec; 27 Suppl 1:163-6

Role of glucagon and somatostatin in insulin release. Taniguchi H, et al. **Endocrinol Jpn** 1980 Dec;27 Suppl 1:103-7

Effect of intraventricular injection of neurotensin and other various bioactive peptides on plasma immunoreactive somatostatin levels in rat hypophysial portal blood. Abe H, et al. **Endocrinology** 1981 May; 108(5):1939–43

Isolation and characterization of rat hypothalamic somatostatin–14. Bohlen P, et al. **Endocrinology** 1981 May;108(5):2008–10

Somatostatin–28: selective action on the pancreatic beta–cell and brain. Brown M, et al. **Endocrinology** 1981 Jun;108(6):2391–6

Effect of insulin on glucose– and arginine–stimulated somatostatin secretion from the isolated perfused rat pancreas. Gerber PP, et al. **Endocrinology** 1981 Jul;109(1):279–83

Effect of calcium on the secretion of somatostatin and insulin from pancreatic islets. Kanatsuka A, et al. **Endocrinology** 1981 Jun; 108(6):2254–7

Heterogeneity of somatostatin–like peptides in rat brain, pancreas, and gastrointestinal tract. Trent DF, et al. **Endocrinology** 1981 Jun; 108(6):2033–8

Effects of somatostatin–14 and somatostatin–28 on bombesin–stimulated release of gastrin, insulin, and glucagon in the dog. Vaysse N, et al. **Endocrinology** 1981 May;108(5):1843–7

Factors modulating the secretion of thyrotropin and other hormones of the thyroid axis. Hedge GA, et al. **Environ Health Perspect** 1981 Apr; 38:57–63

The effect of somatostatin on haemostasis in dogs. Gabryelewicz A, et al. **Folia Haematol (Leipz)** 1981;108(1):125–31

Effect of antisomatostatin gamma–globulin on gastrin release in rats. Chiba T, et al. **Gastroenterology** 1981 Aug;81(2):321–6

TRH, GH–RIH, and LH–RH in metamorphosing Xenopus laevis. King JA, et al. **Gen Comp Endocrinol** 1981 May;44(1):20–7

Demonstration of peptides immunologically related to vertebrate neurohormones in Dugesia lugubris (Turbellaria, Tricladida). Schilt J, et al. **Gen Comp Endocrinol** 1981 Mar;43(3):331–5

Correlative immunocytochemical and electron microscopic studies: identification of (entero)glucagon– somatostatin– and pancreatic polypeptide–like–containing cells in the human colon. Lehy T, et al. **Histochemistry** 1981;71(1):67–80

Failure of somatostatin and beta–endorphin to affect bovine adrenal cortex cells in vitro. Diel F, et al. **Horm Metab Res** 1981 Feb;13(2):95–8

Effects of antisomatostatin and antiglucagon sera on insulin release from isolated Langerhans' islets of rats. Tanigawa K, et al. **Horm Metab Res** 1981 Feb;13(2):78–80

Inhibition of islet prohormone to hormone conversion by incorporation of arginine and lysine analogs. Noe BD. **J Biol Chem** 1981 May 25; 256(10):4940–6

Release of somatostatin–like immunoreactivity from the perfused canine thyroid. Selective stimulatory effect of calcium ions. Laurberg P, et al. **J Clin Invest** 1981 May;67(5):1451–6

Immunohistochemical localization of substance–P, somatostatin, and methionine–enkephalin in the spinal cord and dorsal root ganglia of the North American opossum, Didelphis virginiana. Ditirro FJ, et al. **J Comp Neurol** 1981 May 10;198(2):351–63

Somatostatin decreases food intake of rats and baboons. Lotter EC, et al. **J Comp Physiol Psychol** 1981 Apr;95(2):278–87

The effect of somatostatin on pancreatic endocrine responses mediated via the parasympathetic innervation in the conscious calf. Bloom SR, et al. **J Physiol (Lond)** 1980 Nov;308:29–38

Non–vasoactive intestinal polypeptide, nonsomatostatin fundic inhibitoy mechanism. Soon–Shiong P, et al. **J Surg Res** 1981 May; 30(5):473–77

Action of prosomatostatin [letter] Bommelaer G, et al. **Lancet** 1981 Apr 25;1(8226):949

Systemic and pulmonary haemodynamic effects of somatostatin [letter] Hallemans R, et al. **Lancet** 1981 Jun 6;1(8232):1270

Stimulatory effect of somatostatin on norepinephrine release from rat brain cortex slices. Tsujimoto A, et al. **Life Sci** 1981 Feb 23;28(8):903–10

Role of cyclic nucleotides in the inhibition of growth–hormone secretion by somatostatin. Bicknell RJ, et al. **Mol Cell Endocrinol** 1981 Apr; 22(1):85–94

Absence of luteinizing hormone–releasing and anti–fertility properties in a glucagon–selective somatostatin analogue. Bex FJ, et al. **Nature** 1981 Jun 25;291(5817):672–3

Selective effects of somatostatin–14, –25 and –28 on in vitro insulin and glucagon secretion. Mandarino L, et al. **Nature** 1981 May 7; 291(5810):76–7

Ionic channels involved in the LHRH and SRIF release from rat mediobasal hypothalamus. Drouva SV, et al. **Neuroendocrinology** 1981 Mar;32(3):155–62

Opiate receptors modulate LHRH and SRIF release from mediobasal hypothalamic neurons. Drouva SV, et al. **Neuroendocrinology** 1981 Mar; 32(3):163–7

Somatostatin–like immunoreactivity in amacrine cells of the chicken retina. Buckerfield M, et al. **Neuroscience** 1981;6(4):689–95

Gastrointestinal secretory, motor, circulatory, and metabolic effects of prosomatostatin. Konturek SJ, et al. **Proc Natl Acad Sci USA** 1981 Mar; 78(3):1967–71

The biological activity of catfish pancreatic somatostatin. Oyama H, et al. **Regul Pept** 1981 Mar;1(6):387–96

The kinetics of somatostatin inhibition of gastric acid secretion. Thomas WE. **Regul Pept** 1980 Dec;1(3):245–51

Beneficial effect of somatostatin in phalloidin–intoxicated rats. Influence on survival rate, biochemical and morphological data, and 3H–demethylphalloin absorption rate by the liver. Wdowinski JM, et al. **Res Exp Med (Berl)** 1981.178(2):155–63

The effect of somatostatin on fasting and postprandial plasma GIP, serum insulin, and blood glucose in man. Jorde R, et al. **Scand J Gastroenterol** 1981;16(1):113–9

Gastrectomy with and without duodenal transit: release of glucagon, insulin and somatostatin. Heil T, et al. **Scand J Gastroenterol [Suppl]** 1981;67:83–7

[Somatostain: a pancreatic hormone which may be important] Strosser MT, et al. **Journ Annu Diabetol Hotel Dieu** 1981;:197–210 (51 ref.) (Fre)

[Inhibition of glucose and leucin absorption by somatostatin in the dog (author's transl)] Mörz R, et al. **Res Exp Med (Berl)** 1981; 178(3):241–6 (Eng. Abstr.) (Ger)

[Somatostatin. I: Structure, biosynthesis and effect] Zühlke H, et al. **Z Gesamte Inn Med** 1981 Jan 15;36(2):51–5 (Eng. Abstr.) (Ger)

STEREOTYPED BEHAVIOR

Ipsiversive turning behaviour after discrete unilateral lesions of the dorsal mesencephalic reticular formation by kainic acid. Mulas A, et al. **Brain Res** 1981 Mar 16;208(2):468–72

Cats develop tolerance to d–amphetamine's effects upon locomotion and stereotyped behaviors. Jacobs BL, et al. **Eur J Pharmacol** 1981 Jan 29; 69(3):353–6

Estrogen potentiates the stereotypy induced by dopamine agonists in the rat. Chiodo LA, et al. **Life Sci** 1981 Feb 16;28(7):827–35

Drug–environment interaction: context dependency of cocaine–induced behavioral sensitization. Post RM, et al. **Life Sci** 1981 Feb 16; 28(7):755–60

The stereotyped behavior syndrome: a new model and proposed therapy. Kryzhanovsky GN, et al. **Pharmacol Biochem Behav** 1981 Mar; 14(3):273–81

Effect of morphine on circling behaviour in rats with 6–hydroxydopamine striatal lesions and electrolesions of the raphe nucleus. Slater P. **Pharmacol Biochem Behav** 1981 May;14(5):625–30

Pharmacokinetic study of apomorphine–induced stereotypy in food deprived rats. Watanabe H, et al. **Pharmacol Biochem Behav** 1981 Apr; 14(4):493–6

Use of the intracerebral injection technique to elucidate mechanisms of apomorphine climbing and its antagonism in the mouse. Costall B, et al. **Psychopharmacology (Berlin)** 1981;73(1):91–4

[Neurophysiologic and pharmacologic evidence of autoregulationin the nigrostriatal system] Arushanian EB, et al. **Biull Eksp Biol Med** 1981 Feb;91(2):133–6 (Eng. Abstr.) (Rus)

STRESS, PSYCHOLOGICAL

Biochemical and circulatory parameters during purely mental stress. Danner SA, et al. **Acta Med Scand** 1981;209(4):305–8

The effect of acute neurogenic stress on corticosterone and Cu an Zn levels in rats. Armario A, et al. **Agressologie** 1980;21(5):259–62

Regional responses of rat brain noradrenergic neurones to acute intense stress. Nakagawa R, et al. **Pharmacol Biochem Behav** 1981 May; 14(5):729–32

Mechanism of stress–induced subsensitivity to norepinephrine. Stone EA. **Pharmacol Biochem Behav** 1981 May;14(5):719–23

Plasma catecholamines in rats: daily variations in basal levels and increments in response to stress. McCarty R, et al. **Physiol Behav** 1981 Jan;26(1):27–31

Adrenal hormones and brain catecholamines responses to morning and afternoon immobilization stress in rats. Torrellas A, et al. **Physiol Behav** 1981 Jan;26(1):129–33

[Studies on stress in psychiatric patients (author's transl)] Ackenheil M, et al. **MMW** 1981 May 8;123(19):805–8 (Eng. Abstr.) (Ger)

[Determination of psychological stress in sea pilot based on urinary catecholamine excretion] Geister R, et al. **Zentralbl Arbeitsmed Arbeitsschutz Prophyl Ergonomie** 1980 Dec; 30(12):458–63 (Ger)

[Activation of the cerebral GABA–ergic inhibiting system in stress] Pavlova VI, et al. **Patol Fiziol Eksp Ter** 1981 Jan–Feb;(1):26–30 (Eng. Abstr.) (Rus)

SUBSTANCE P

Effect of intracerebroventricular administration of substance P and its hexapeptide fragment on the estrus cycle in female rats. Jakubowska–Naziemblo B, et al. **Acta Physiol Pol** 1980;31(6):637–45

Effect of substance P and its C–terminal hexapeptide on gastric and pancreatic secretion in the dog. Konturek SJ, et al. **Am J Physiol** 1981 Jul;241(1):G74–81

Activity of substance P analogs substituted at the Gly9 and Gln6 positions. Blumberg S, et al. **Biochem Biophys Res Commun** 1981 Mar 31; 99(2):752–8

Effect of substance P and its natural analogues on gastric emptying of the conscious rat. Bertaccini G, et al. **Br J Pharmacol** 1981 Feb; 72(2):221-3

The effects of substance P and related peptides on alpha-amylase release from rat parotid gland slices. Brown CL, et al. **Br J Pharmacol** 1981 Jun;73(2):517-23

Circadian variations in substance P, luliberin (LH-RH) and thyroliberin (TRH) contents in hypothalamic and extrahypothalamic brain nuclei of adult male rats. Kerdelhue B, et al. **Brain Res** 1981 Feb 16; 206(2):405-13

Substance P decreases a potassium conductance of spinal cord neurons in cell culture. Nowak LM, et al. **Brain Res** 1981 Jun 15; 214(2):416-23

Behavioral evidence that substance P may be a spinal cord sensory neurotransmitter. Piercey MF, et al. **Brain Res** 1981 Apr 6; 210(1-2):407-12

Immunoreactive substance P in the chicken gut: distribution, development and possible functional significance. Brodin E, et al. **Cell Tissue Res** 1981;216(3):455-69

Nerves containing substance P, vasoactive intestinal polypeptide, enkephalin or somatostatin in the guinea-pig taenia coli. Distribution, ultrastructure and possible functions. Leander S, et al. **Cell Tissue Res** 1981;215(1):21-39

Effect of intraventricular injection of neurotensin and other various bioactive peptides on plasma immunoreactive somatostatin levels in rat hypophysial portal blood. Abe H, et al. **Endocrinology** 1981 May; 108(5):1939-43

Synthesis and biological properties of enzyme-resistant analogues of substance P. Sandberg BE, et al. **Eur J Biochem** 1981 Feb; 114(2):329-37

Substance P in human cord blood and its degradation by placenta in vitro. Skrabanek P, et al. **Eur J Obstet Gynaecol Reprod Biol** 1980 Dec; 11(3):157-61

In vitro release of substance P from spinal cord slices by capsaicin congeners. Bucsics A, et al. **Eur J Pharmacol** 1981 Apr 24; 71(1):71-7

Central blood pressure effects of substance P and angiotensin II: role of the sympathetic nervous system and vasopressin. Unger T, et al. **Eur J Pharmacol** 1981 Apr 24;71(1):33-42

Persistent action of N-methylated analogs of substance P on rat parotid slices. Laufer R, et al. **FEBS Lett** 1981 Jan 26;123(2):291-4

Antagonistic action of baclofen on substance P-induced depolarization in the isolated spinal cord of the frog. Kudo Y, et al. **Gen Pharmacol** 1981,12(3):145-9

Immunocytochemical study of substance P containing nerve terminals in rat spinal cord. Technical considerations. Kakudo K, et al. **Histochemistry** 1981;71(1):17-32

In vitro contraction of the pupillary sphincter by substance P and its stable analogs. Cohen S, et al. **Invest Ophthalmol Vis Sci** 1981 Jun; 20(6):717-21

Characterization of neuropeptides by reversed-phase, ion-pair liquid chromatography with post-column detection by radioimmunoassay. Application to thyrotropin-releasing hormone, substance P, and vasopressin. Spindel E, et al. **J Chromatogr** 1981 Mar 13; 222(3):381-7

Immunohistochemical localization of substance-P, somatostatin, and methionine-enkephalin in the spinal cord and dorsal root ganglia of the North American opossum, Didelphis virginiana. Ditirro FJ, et al. **J Comp Neurol** 1981 May 10;198(2):351-63

Stimulatory and inhibitory effects of substance P on rat submandibular secretion. Martinez JR, et al. **J Dent Res** 1981 Jun;60(6):1031-8

Participation of prostaglandins in the vasodepressor effect of substance P. Pals DT, et al. **J Pharm Pharmacol** 1981 Feb;33(2):110-1

The effect of morphine on the content of serotonin, 5-hydroxyindole acetic acid and substance-P in the nuclei raphe magnus and reticularis gigantocellularis. Lakoski JM, et al. **Life Sci** 1980 Dec 22-29; 27(25-26):2639-44

Does substance P participate in water transport and excretion? Güllner HG. **Med Hypotheses** 1981 Mar;7(3):311-4

Substance P immunoreactive neurons following neonatal administration of capsaicin. Cuello AC, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Jan;315(3):185-94

Indirect evidence for the importance of axonal transport in maintenance of stores of the mediator of neurogenic oedema. Morton CR, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):277-80

Further characterization of the binding of substance P to a fraction from rabbit brain enriched in synaptic membranes. Nakata Y, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1980 Nov;314(3):211-4

Response of striatonigral substance P systems to a dopamine receptor agonist and antagonist. Hanson G, et al. **Neuropharmacology** 1981 Jun; 20(6):541-8

The cornea is not innervated by substance P-containing primary afferent neurons. Neuhuber W, et al. **Neurosci Lett** 1981 Feb 23;22(1):5-9

Projections of substance P-containing neurons within the guinea-pig small intestine. Costa M, et al. **Neuroscience** 1981;6(3):411-24

Immunoreactive substance P in sympathetic ganglia: distribution and sensitivity towards capsaicin. Gamse R, et al. **Neuroscience** 1981; 6(3):437-41

An immunohistochemical study of enkephalins and other neuropeptides in the striatum of the cat with evidence that the opiate peptides are arranged to form mosaic patterns in register with the striosomal compartments visible by acetylcholinesterase staining. Graybiel AM, et al. **Neuroscience** 1981;6(3):377-97

Human spinal neurons: innervation by both substance P and enkephalin. LaMotte CC, et al. **Neuroscience** 1981;6(4):713-23

Peptide containing nerves in the ureter of the guinea-pig and cat. Wharton J, et al. **Neuroscience** 1981;6(5):969-82

Substance P as a baro- and chemoreceptor afferent neurotransmitter: immunocytochemical and neurochemical evidence in the rat. Helke CJ, et al. **Peptides (Fayetteville)** 1980 Spring;1(1):1-9

Influence of substance P on the behavioral changes induced by haloperidol in rats. Jolicoeur FB, et al. **Peptides (Fayetteville)** 1980 Spring; 1(1):103-7

Substance P activity in the bullfrog retina: localization and identification in several vertebrate species. Eskay RL, et al. **Science** 1981 May 29; 212(4498):1049-50

[Distribution of substance P and methionine enkephalin in dorsolateral pontine tegmentum of the cat. Immunofluorescence study] Charnay Y, et al. **C R Acad Sci [D] (Paris)** 1981 Feb 2;292(5):435-40 (Eng. Abstr.) **(Fre)**

[The activity of dipeptidyl peptidase IV in various organs and tissues of the rat and its possible relation with substance P metabolism] Labsch B, et al. **Pharmazie** 1981;36(2):161-3 **(Ger)**

SUBSTANCE USE DISORDERS

Use of a drug-screening service in an inner-city teaching hospital. Bury RW, et al. **Med J Aust** 1981 Feb 7;1(3):132-3

SUCKING BEHAVIOR

Decreased dopamine turnover in the median eminence in response to suckling in the lactating rat. Selmanoff M, et al. **Brain Res** 1981 May 11;212(1):101-15

SYMPATHOMIMETICS

Differential beta-adrenergic sensitivity of atrial tissue assessed by chronotropic and inotropic responses to several sympathomimetic amines. Marquez MT, et al. **Acta Physiol Lat Am** 1978; 28(4-5):193-9

Pindolol in orthostatic hypotension [letter] Nyberg G. **Br Med J** 1981 May 23;282(6277):1704

Intracerebroventricular injection of sympathomimetic drugs inhibits both heat production and heat loss mechanisms in the rat. Lin MT, et al. **Can J Physiol Pharmacol** 1980 Aug;58(8):896-902

Effect of increased adrenergic activity on the relationship between electrical and mechanical systole. Boudoulas H, et al. **Circulation** 1981 Jul;64(1):28-33

Cholinergic effect of 4-aminopyridine and adrenergic effect of 4-methyl-2-aminopyridine in cardiac muscle. Glover WE. **Eur J Pharmacol** 1981 Apr 24;71(1):21-31

Responses of the rat anococcygeus muscle to sympathomimetics. Fanimo O, et al. **Gen Pharmacol** 1981;12(3):205-8

[Effects of parasympathomimetic and sympathomimetic drugs on the sublingual glands of rats] Abe K, et al. **Gifu Shika Gakkai Zasshi** 1980 Jun;8(1):36-52 (Eng. Abstr.) **(Jpn)**

[Procedure for using adrenomimetic preparations in heart surgery] Solov'ev GM, et al. **Kardiologiia** 1981 Feb;21(2):26-31 (Eng. Abstr.) **(Rus)**

SYNAPTIC RECEPTORS

The insensitivity of developing benzodiazepine receptors to chronic treatment with diazepam, GABA and muscimol in brain cell cultures. Shibla DB, et al. **Brain Res** 1981 Apr 6;210(1-2):471-4

gamma-Aminobutyric acid regulation of the benzodiazepine receptor: biochemical evidence for pharmacologically different effects of benzodiazepines and propyl beta-carboline-3-carboxylate. Ehlert FJ, et al. **Eur J Pharmacol** 1981 Apr 9;70(4):593-5

Molecular sizes of benzodiazepine receptors and the interacting GABA receptors in the membrane are identical. Chang LR, et al. **FEBS Lett** 1981 Apr 20;126(2):309-12

Benzodiazepine receptor: heterogeneity in rabbit brain. Yokoi I, et al. **Life Sci** 1981 Apr 6;28(14):1591-5

Discrimination of functionally heterogeneous receptor subpopulations: antipsychotic and antidopaminergic properties of metoclopramide [proceedings] Rotrosen J, et al. **Psychopharmacol Bull** 1981 Jan; 17(1):110-3

TASK PERFORMANCE AND ANALYSIS

Psychophysiological effects of repetitive tasks. Weber A, et al. **Ergonomics** 1980 Nov;23(11):1033-46

TESTOSTERONE

Effect of zinc supplementation on serum testosterone level in adult male sickle cell anemia subjects. Prasad AS, et al. **Am J Hematol** 1981; 10(2):119–27

Gonadotropin-releasing hormone analog and testosterone synergistically inhibit spermatogenesis. Heber D, et al. **Endocrinology** 1981 May; 108(5):2019–21

The role of hypothalamic adrenergic receptors in preventing testosterone-induced androgenization in the female rat brain. Raum WJ, et al. **Endocrinology** 1981 Jul;109(1):273–8

Bromocriptine stimulates testosterone production by mouse testes in vitro. Bartke A, et al. **Fertil Steril** 1981 Apr;35(4):472–6

Plasma thyroxine and testosterone levels in the red fox (Vulpes vulpes L.) during the annual cycle. Maurel D, et al. **Gen Comp Endocrinol** 1981 Mar;43(3):402–4

Inhibition of the action of sex steroids by gonadotropin-releasing hormone (GnRH) agonists: a new biological effect. Sundaram K, et al. **Life Sci** 1981 Jan 5;28(1):83–8

Impact of social conflict between mice on testosterone binding in the central nervous system. Raab A, et al. **Neuroendocrinology** 1981 May; 32(5):272–7

Influence of castration and testosterone propionate on [3H]noradrenaline metabolism in various structures of male rat brain. Bekhtereva EP. **Neurosci Behav Physiol** 1980 Nov–Dec;10(6):471–3

Effect of androgens on the rate of muscle protein breakdown in rats treated with glucocorticoids. Santidrian S, et al. **Reproduccion** 1980 Oct–Dec;4(4):331–3

Delta9-tetrahydrocannabinol increase plasma testosterone concentrations in mice. Dalterio S, et al. **Science** 1981 Jul 31;213(4507):581–3

[Endocrinology and diseases of the testis in children] Zweymüller E. **Wien Med Wochenschr** 1981 Feb 15;131(3):68–72 (Ger)

THIOPROPERAZINE

[Effect of aminazine and majeptil on proliferation of peripheral blood lymphocytes cultivated with phytohemagglutinin] Mitkevich SP, et al. **Zh Nevropatol Psikhiatr** 1981;81(2):115–7 (Eng. Abstr.) (Rus)

THIORIDAZINE

Self-stimulation and locomotor changes indicating 'latent' anticholinergic activity by an atypical neuroleptic (thioridazine). Herberg LJ, et al. **Neuropharmacology** 1981 Jan;20(1):55–60

Change in human electroretinography associated with thioridazine administration. Miyata M, et al. **Ophthalmologica** 1980; 181(3–4):175–80

A double-blind comparison of trebenzomine and thioridazine in the treatment of schizophrenia. Georgotas A, et al. **Psychopharmacology (Berlin)** 1981;73(3):292–4

[Effect of thioridazine on sexual responsiveness in the male (phalloplethysmographic study)] Topiar A. **Agressologie** 1980; 21(A):49–51 (Eng. Abstr.) (Ger)

[Case of melleril poisoning] Davidovich DA. **Sud Med Ekspert** 1981 Apr–Jun;24(2):58 (Rus)

THIOTHIXENE

Exaggerated hyperprolactinemia in response to thiothixene [letter] Ash PR, et al. **Arch Neurol** 1981 Aug;38(8):534–5

Thiothixene plasma levels and clinical response in acute schizophrenia. Reifler BV, et al. **J Clin Psychiatry** 1981 May;42(5):207–11

THYROID HORMONES

Effect of thyroidectomy on choline acetyltransferase in rat hypothalamic nuclei. Kojima M, et al. **Brain Res** 1981 Mar 23;209(1):227–30

The thyroid lysosomal system: dynamic state of the organelles in relation to iodine release. Miquelis R, et al. **Eur J Cell Biol** 1981 Apr; 24(1):70–3

Erythrocytic and granulocytic differentiation of transplanted bone marrow cells in mice treated with thyroid hormones. Mikeska J, et al. **Folia Biol (Praha)** 1981;27(2):126–34

Morphological picture of hormone synthesis in the thyroid and its dependence on neurohumoral regulatory mechanisms. Volkova OV, et al. **Folia Morphol (Praha)** 1981;29(1):46–8

Thyroid hormone effects on beta-adrenergic receptors in isolated fat cells in rats. Pfeifle B, et al. **Horm Metab Res** 1981 Apr;13(4):218–21

Relationship between thyrotropin, thyroid hormones, thyroxine-binding globulin and estradiol-17 beta levels in normal pregnancy. Sawhney RC, et al. **Indian J Med Res** 1981 Jan;73:41–52

Thyroid hormones are required for daily rhythms of plasma corticosterone and prolactin concentration. Ottenweller JE, et al. **Life Sci** 1981 Mar 2;28(9):1033–40

MOde of entry of steroid and thyroid hormones into cells. Rao GS. **Mol Cell Endocrinol** 1981 Feb;21(2):97–108 (68 ref.)

Effects of open-heart surgery on thyroid hormone levels. Barta E, et al. **Resuscitation** 1980 Dec;8(4):233–41

[Structure of thyroglobulin and its function in thyroid gland (author's transl)] Pawelczak K, et al. **Postepy Biochem** 1980;26(4):559–83 (132 ref.) (Pol)

[Hormonal and lipid metabolic changes in chronic occupational methylmethacralate poisoning] Makarov IA, et al. **Gig Tr Prof Zabol** 1981 Apr;(4):20–2 (Eng. Abstr.) (Rus)

THYROTROPIN

The TSH response to TRH is exaggerated in primary testicular failure and normal in the male castrate. LeRoith D, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):103–8

Further evidence of the dual role of noradrenaline in regulation of thyrotrophin secretion in male rats. Männistö PT, et al. **Acta Endocrinol (Copenh)** 1981 Jun;97(2):213–20

Serum prolactin and thyrotrophin responses to thyrotrophin-releasing hormone at different times of the day in normal women. Pérez-López FR, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):7–11

Influence of TRH and TSH on the ultrastructure of rat pineal gland. Karasek M. **Acta Med Pol** 1980;21(4):347–8

Effect of trifluoperazine, D600, and phenytoin on depolarization- and thyrotropin-releasing hormone-induced thyrotropin release from rat pituitary tissue. Fleckman A, et al. **Endocrinology** 1981 Jun; 108(6):2072–7

Studies on the mechanism of 3,5,3'-triiodothyronine-induced suppression of secretagogue-induced thyrotropin release in vitro. Gard TG, et al. **Endocrinology** 1981 Jun;108(6):2046–53

Evidence for a possible role for Ca++ in the 3,5,3'-triiodothyronine inhibition of thyrotropin-releasing hormone-induced secretion of thyrotropin by rat anterior pituitary in vitro. Schrey MP, et al. **Endocrinology** 1981 May;108(5):1690–6

Factors modulating the secretion of thyrotropin and other hormones of the thyroid axis. Hedge GA, et al. **Environ Health Perspect** 1981 Apr; 38:57–63

Pharmacological studies of the involvement of hypothalamic prostaglandins in the regulation of thyrotropin secretion. Wright KC, et al. **Environ Health Perspect** 1981 Apr;38:83–8

Morphological picture of hormone synthesis in the thyroid and its dependence on neurohumoral regulatory mechanisms. Volkova OV, et al. **Folia Morphol (Praha)** 1981;29(1):46–8

Relationship between thyrotropin, thyroid hormones, thyroxine-binding globulin and estradiol-17 beta levels in normal pregnancy. Sawhney RC, et al. **Indian J Med Res** 1981 Jan;73:41–52

Effects of thyroidectomy, propylthiouracil, and thyroxine on pituitary content and immunocytochemical staining of thyrotropin (TSH) and thyrotropin releasing hormone (TRH). Childs GV, et al. **J Histochem Cytochem** 1981 Mar;29(3):357–63

Serum thyroxine, triiodothyronine, and TSH levels in iodine-deficient and iodine-sufficient rats before and after exposure to cold. Nakashima T, et al. **Proc Soc Exp Biol Med** 1981 May;167(1):45–50

Exhaustibility of pituitary thyrotropin pool in old age by repeated administration of thyrotropin releasing hormone. Szabolcs I, et al. **ZFA (Dresden)** 1981;36(1):23–8

[Human thyrotropin radioimmunoassay (heterogenous system) and its clinical application (author's transl)] Lin XT. **Chung Hua Nei Ko Tsa Chih** 1979;18(3):192–6 (Chi)

THYROXINE

Blood sugar, serum insulin and serum free fatty acid responses to slow graded glucose in thyroxine-treated dogs. Renauld A, et al. **Acta Diabetol Lat** 1980 Jul–Dec;17(3–4):189–97

Thyroid hormone-catecholamine interrelationships during exposure to cold. Storm H, et al. **Acta Endocrinol (Copenh)** 1981 May;97(1):91–7

Hormonal control of postnatal development of corticosteroid-binding globulin. D'Agostino J, et al. **Am J Physiol** 1981 Apr;240(4):E402–6

Free thyroxine and free thyroxine index in women taking oral contraceptives. Swanson MA, et al. **Clin Nucl Med** 1981 Apr; 6(4):168–71

Plasma corticosterone and thyroxine concentrations during chronic ingestion of crude oil in mallard ducks (Anas platyrhynchos). Rattner BA, et al. **Comp Biochem Physiol** [C] 1981;68C(2):103–7

Altered ontogenesis of muscarinic cholinergic receptor in mouse brain: effect of L-thyroxine and betamethasone. Ben-Baruch G, et al. **Endocrinology** 1981 Jul;109(1):235–9

Hormonal control of growth in the infant rat. Glasscock GF, et al. **Endocrinology** 1981 Jul;109(1):176–84

Calcium depletion stimulates thyroxine release from the thyroid. Maayan ML, et al. **Endocrinology** 1981 May;108(5):1987–8

In vivo and in vitro effects of adrenaline on conversion of thyroxine to triiodothyronine and to reverse-triiodothyronine in dog liver and heart. Nauman A, et al. **Eur J Clin Invest** 1980 Jun;10(3):189–92

Composition and efficacy of iodothyronine immunogens and host responsiveness in radioimmunoassay (RIA) for serum thyroxine (T4). Margherita S, et al. **Experientia** 1981 Mar 15;37(3):314–5

The effects of thyroxine treatment, in vivo and in vitro, on Ca2+ efflux from rat liver mitochondria. Shears SB, et al. **FEBS Lett** 1981 Apr 6;126(1):9-12

Cellular quantitation of hemoglobin transition during natural and thyroid-hormone-induced metamorphosis of the bullfrog, Rana catesbeiana. Forman LJ, et al. **Gen Comp Endocrinol** 1981 May; 44(1):1-12

Thyroid in reproduction of reptiles. Haldar-Misra C, et al. **Gen Comp Endocrinol** 1981 Apr;43(4):537-42

Plasma thyroxine and testosterone levels in the red fox (Vulpes vulpes L.) during the annual cycle. Maurel D, et al. **Gen Comp Endocrinol** 1981 Mar;43(3):402-4

Prolactin inhibits the induction of its own renal receptors in Rana catesbeiana tadpoles. White BA, et al. **Gen Comp Endocrinol** 1981 Jan; 43(1):30-8

Cell population kinetics in tadpole limb epidermis during thyroxine-induced, spontaneous, and prolactin-inhibited metamorphosis. Wright ML, et al. **Gen Comp Endocrinol** 1981 Apr; 43(4):451-61

Correlation between plasma thyroxine levels and corticosterone-binding activity in intact, ovariectomized, and ovariectomized estrogen-treated rats. Calvano SE, et al. **Horm Metab Res** 1981 Mar;13(3):171-4

Combined effects of neonatal thyroxine treatment and neonatal castration on sebum production in adult male rats. Toh YC. **J Endocrinol** 1981 May;89(2):225-8

Effects of thyroidectomy, propylthiouracil, and thyroxine on pituitary content and immunocytochemical staining of thyrotropin (TSH) and thyrotropin releasing hormone (TRH). Childs GV, et al. **J Histochem Cytochem** 1981 Mar;29(3):357-63

Effect of thyroxine on nerve growth factor concentration in neonatal mouse brain. Walker P, et al. **Life Sci** 1981 Apr 13-20; 28(15-16):1777-87

Serum thyroxine, triiodothyronine, and TSH levels in iodine-deficient and iodine-sufficient rats before and after exposure to cold. Nakashima T, et al. **Proc Soc Exp Biol Med** 1981 May;167(1):45-50

Systemic thyroxin levels in sheep with a bioartificial thyroid using xenogeneic canine tissue. White DC, et al. **Trans Am Soc Artif Intern Organs** 1980;26:423-7

[Determination of half-life time for the key enzymes of the pentose phosphate pathway--glucose-6-phosphate dehydrogenase and transketolase] Kudriavtseva GV, et al. **Biokhimiia** 1980 Jan; 45(1):118-23 (Eng. Abstr.) **(Rus)**

[Regulation of genetic activity by thyroid hormones. II. Specificity of interaction of cytoplasmic thyroxine receptor isolated from human embryonal fibroblasts and HeLa cells with DNA] Abdukarimov A, et al. **Probl Endokrinol (Mosk)** 1981 Mar-Apr;27(2):66-70 (Eng. Abstr.) **(Rus)**

[Regulation of genetic activity by thyroid hormones. Effect of purified cytoplasmic hormone-receptor complex on the chromatin template activity] Abdukarimov A, et al. **Probl Endokrinol (Mosk)** 1981 Jan-Feb; 27(1):50-3 (Eng. Abstr.) **(Rus)**

The *Psychopharmacology Bulletin* is prepared by the Pharmacologic and Somatic Treatments Research Branch of the National Institute of Mental Health. Its purpose is to facilitate the dissemination and exchange of information among the national and international scientific community. The emphasis is on rapid, informal reporting of work which has not appeared in the more formal literature. We invite contributions such as review articles, letters to the Editor, news items, books for review, and announcements appropriate for the *Bulletin*.

All material published in the *Psychopharmacology Bulletin* is in the public domain unless otherwise noted.

Individuals interested in submitting material to the *Psychopharmacology Bulletin* should contact:

Allen Raskin, Ph.D.
Editor-in-Chief
Psychopharmacology Bulletin
National Institute of Mental Health
5600 Fishers Lane Rm. 10C-14
Rockville, MD 20857

We respectfully ask you to adhere to the following guidelines when preparing a paper for the *Psychopharmacology Bulletin:*

1. Manuscript Format: Manuscripts should be typed double-spaced with ample margins, and submitted in triplicate. Do not split paragraphs from one page to another, even if this makes page lengths uneven. Also, do not hyphenate words at the end of a line, even if this makes uneven lines.

Title page should include each author's name, degree, and full address.

Papers should be written in *third* person, e.g., the investigators found, **Not:** I found, we found. Contents should be *substantive*, not indicative, e.g., the investigator used the gas chromatography method to determine the three molecular structures, **Not:** The author described the method for determining the structure of the drug.

2. Figures: Figures, charts, or graphs should be submitted as glossies (photographs printed on smooth shiny paper) or should be professionally prepared using black ink on white paper. Only one copy is needed. Indicate in the text where these figures and their legends should be placed.

3. References: References mentioned in the text should appear as full citations in the **References** following the article. We are now using the author-date method of citation, that is, the surname of the author and the year of publication are to be used in the text, i.e.: Smith (1970) compared reaction times . . . or, In a recent study of reaction times (Smith 1970) . . . This method gives readers useful information in the text and enables them to locate the citation easily in the alphabetical reference list at the end of the article.

If a work has two authors, always cite both names every time the reference occurs in the text. If more than two authors, cite all authors the first time the reference occurs; include only the surname of the first author followed by "et al." (not italicized) and the year in subsequent citations of the same reference, i.e.:

Williams, Jones, and Smith (1963) found their data . . . (1st occurrence)

Williams et al. (1963) found their data . . . (2nd occurrence)

4. Abbreviations: Abbreviations should appear in parentheses after the first time they are mentioned in the paper, i.e., Brief Psychiatric Rating Scale (BPRS).

Use generic names in referring to drugs; trade names may be given in parenthesis the first time a drug is mentioned only.

Journal titles should be abbreviated in the *References* according to the National Library of Medicine's Index Medicus.

Book Review

•Psychotropic Drug Handbook—Third Edition, is a small book, 6½ x 4½ inches and 198 pages, containing a wealth of information for the physician who prescribes psychoactive medication. For each of the major classes of psychoactive drugs, antipsychotics, antidepressants, hypnotics, etc., there is a general statement describing the symptoms, behaviors, and diagnostic groups for whom the class of drugs is intended, a brief description of the mechanism of action of these drugs, dosage recommendations based on factors such as severity of illness, a section on pharmacokinetics, and a lengthy and complete description of adverse drug effects and how these should be managed.

In addition, the authors, two pharmacologists and a psychiatrist, provide the generic and trade names for marketed drugs in each drug class and the direct cost from the manufacturers for the medication. Other features of the book which I would commend are an initial section on general principles of drug use which discusses issues such as the dangers of polypharmacy, the advantages and disadvantages of divided doses, and the concerns with drug-drug interactions. The back of the book contains sample patient instruction forms which may be given to patients to instruct them in how the medication should be taken and to alert them to possible adverse effects. These are very complete and written in language that would be understandable to most patients.

In sum, I would highly recommend this book to any physician who prescribes psychotropic medication, particularly those in nonpsychiatric fields who would be less likely to be current with research and experience with these drugs than their psychiatric brethren. One note of caution: the book does represent the views of the authors, and others in the field may not always agree with their recommendations for drug use. I was also a little disappointed with the references cited at the back of the book which I felt were skimpy and could be expanded.

The book may be purchased from the publisher, Harvey Whitney Books, 4906 Cooper Road, P.O. Box 42442, Cincinnati, OH 45242. Price: U.S.$9.50, Softbound; 198 pp.

Letter to the Editor:

Sudden Death and Neuroleptics

It has recently come to our attention that the otherwise very excellent column by Dr. Paul Leber in the July 1981 *Psychopharmacology Bulletin* (1) regarding sudden death as a risk of neuroleptic treatment contains an erroneous reference to a recent publication of ours (2). The column indicated us as suggesting that hospitalized chronic schizophrenics may be at *decreased* (emphasis in the column) risk for death compared to the age- and sex-matched general population. The analyses of the article in question were limited to age- and sex-specific mortality rates at two points in time (1970 and 1977) for *hospitalized psychiatric patients only* and indicated a reduction in mortality risk over time in this population. In a subsequent report (3), we compared mortality rates among hospitalized psychiatric patients with general population rates after age adjustment and found consistently elevated mortality among psychiatric patients as compared to the general population. In neither study did we report mortality rates by diagnosis.

We have examined mortality rates (unpublished data) by diagnosis in a large inpatient psychiatric population in comparison to general population rates and have consistently found increased mortality among patients in all age-, sex-, and diagnosis-specific categories. Thus, while it is true that the mortality risk for chronic schizophrenics is the lowest of all diagnostic groups we studied, it is still substantially increased over the risk expected in an age- and sex-matched general population sample.

In a word, chronic schizophrenics in our studies were at *increased* risk for death compared to the age- and sex-matched general population.

We hesitated to make this rather minor point, since the major thrust of the column is excellent and points to important directions for further investigation of rarely occurring potential adverse drug reactions. However, we simultaneously felt that your readership should not be misled by the above misattribution.

Reply to Drs. Craig and Lin

I thank Drs. Craig and Lin for the gracious way in which they draw attention to my mis-interpretation of their findings (1). I assumed, incorrectly, that their calculations of expected 1977 patient deaths employed population based mortality rates for 1970. Their paper clearly states that hospital based rates were used, and I apologize for the confusion created by my incorrect citation of their work.

The actual findings of Drs. Craig and Lin support the generally held view that populations of chronic psychiatric patients (i.e., subjects likely to have received neuroleptics) have a mortality risk exceeding that of the general population. Thus, their findings do not militate against arguments supporting an etiologic role for neuroleptics in sudden death (the implication I intended in citing their work in my paper).

Errata

In the January 1982 issue (Vol. 18, No. 1) of the *Bulletin*, pages 95/96 and 97/98 were transposed.

On pages 110 and 111 of Dr. Campbell's article in the January issue (Vol. 18, No. 1) the footnotes should read: *ND= < .50 ng/ml.

Report from a WHO Collaborative Reference Center for the Study of Psychotropic Drugs

Psychopharmacological Research in India

The following is a short resumé of work done in the field of psychopharmacology in India in 1980. The Report was provided by Drs. V.N. Bagadia, V.K. Mundra, and K.M. Dhawale of the Department of Psychiatry, KEM Hospital, Parel, Bombay, India. Their material was obtained from the *Indian Journal of Psychiatry*, and the papers read at the 33d Annual Conference of the Indian Psychiatric Society (IPS) at Ahmedabad and the 11th Annual Conference of the Indian Psychiatric Society—West Zone (IPS—WZ), Mahableshwar, India.

Antidepressant Drugs

A comparative evaluation of dothiepin (Prothiaden) and imipramine in the treatment of severe depression demonstrated no significant differences in efficacy and tolerability between the two drugs (Chaturvedi et al., 1980).

Gurmeet Singh (1980) found a single bedtime dose of Sintamil superior to divided doses in depression. With the single dose there were fewer side effects and greater patient compliance than with the divided doses.

Sharma and Hegde (1980) compared doxepin in a similar fashion and concluded there were no significant differences in effectiveness and incidence of side effects between the two regimes. They caution, however, against using single-dose therapy in a geriatric population.

Sethi and Bhiman (1980) failed to find any significant differences in efficacy of doxepin vs. that of imipramine and amitriptyline. The correlations between serum levels and therapeutic response for each of the three drugs was also poor.

Quadri et al. (1980) found response to d-amphetamine to be an accurate predictor of antidepressant response to the tricyclics imipramine and amitriptyline.

Sethi et al. (1980) have reported four cases of unipolar depressed patients who developed manic features while on antidepressant medication. They consider the age of the patient, metabolic products of the tricyclic antidepressant, and the central monoamine systems as important in the genesis of this effect.

Antipsychotic Drugs

Deo et al. (1980) found fluphenazine decanoate to be an effective treatment in chronic schizophrenics at a dose of 12.5 mg/week.

DeSouza and DeSouza (1980c) compared a weekly vs. biweekly schedule of fluphenazine decanoate. They found that with the weekly schedule, the compliance was superior with fewer side effects and greater therapeutic efficacy.

V.D. Shah et al. (1980) carried out an open clinical trial with penfluridol in chronic schizophrenics and found a good response to this drug in the dosage range of 20-80 mg/week over a period of 3-6 months.

Sharma and Nandkumar (1980) reported results of a double-blind clinical trial of trifluoperazine against trifluoperazine combined with trihexyphenidyl hydrochloride.

Lithium

Venkoba Rao et al. (1980) studied the effects of lithium on the kidney by means of renal function tests and renal biopsy. They failed to find any correlation between renal function and the intensity and duration of lithium therapy. Khandelwal et al. (1980) studied renal function after 1 year of lithium therapy and also found no significant renal dysfunction.

Sampath et al. (1980a) studied the red blood cell-plasma lithium ratios in manic patients treated with lithium. They found that lithium responders had indeed higher ratios than nonresponders but could not establish a cutoff value to differentiate the two groups. Nataraj and Bhat (1980) did not find any correlation between the saliva serum lithium ratio and clinical response.

Lakdawalla et al. (1980) reported on their experience in treating aggressive behavior and hyperkinetic syndrome with lithium. They have also attempted to draw a correlation between clinical response, dose, and serum lithium levels.

Venkoba Rao and Hariharasubramanian (1980) have reported significant electrocardiographic changes in long-term lithium therapy with serum lithium levels in their patients well within accepted therapeutic range and with no obvious electrolyte disturbance in evidence. They suggested occasional electrocardiogram (ECG) monitoring to forestall impairment of cardiac function.

Hariprasad et al. (1980) have not found lithium to be hepatotoxic, and Sampath et al. (1980c) have failed to note a significant correlation between the patient's insight into his illness and lithium compliance.

Sampath et al. (1980b) presented a single case report of the occurrence of severe neurotoxicity in a young manic patient who had a lithium serum level within the therapeutic range.

Miscellaneous

DeSouza and DeSouza (1980a) reported on the treatment of 1,000 alcoholics with disulfiram. Seventy-six percent of these patients showed a satisfactory response at the end of 6 months. In another paper (1980b), these workers discussed the toxicity of this drug and concluded that it is a safe drug in a dosage of 250 mg/day.

Dhawale et al. (1980) tried disulfiram on 57 patients after giving them an initial challenge with this drug. Using an extensive evaluation scale, they reported a 50% improvement at the end of 6 months.

Khorana (1980) found a fair degree of improvement at the end of the 3d or 4th week in emotionally disturbed children treated with nitrazepam.

Bagadia et al. (1980) tried piracetam vs. placebo in a double-blind fashion in cases of cognitive deficiency resulting from electroconvulsive therapy (ECT). They did not find any statistical difference in the improvement recorded by the two groups.

Kulkarni and Mulay (1980) investigated the value of propanidid vs. thiopentone as an inducing agent in ECT and concluded that propanidid was a better agent because of its faster induction, earlier recovery, and shorter half-life. This would be particularly helpful in rendering better service at public hospitals.

Gada (1980) has reported on three cases of prolonged apnea with succinylcholine during ECT.

Vyavahare and Deo (1980) presented a case report of the value of carbamazepine in brain trauma.

Gautam et al. (1980) tried out an ayurvedic compound (Unmad Bhanjan Ras) in acute psychotic excitement (Vatanmada) in a double-blind fashion. They reported an 85% response recovery rate with the active drug vs. 15% with placebo.

Shah et al. (1980) have carried out a drug surveillance program in psychiatry, the first of its kind in India. They have examined the side effects of drugs, correlation of drug response with socio-demographic factors, clinical characteristics and pharmacological profile of the drug, mechanisms of side effects, and level of patient acceptance. In general, they reported a low incidence and intensity of side effects with the psychoactive drugs. Acceptance was good, and no correlations were found between side effects, socio-demographic factors, and clinical response.

Chakraborty et al. (1980) expressed concern about psychotropic drug use and called on psychiatrists to use minimally effective doses to avoid the danger of turning patients into drug addicts.

Adverse Drug Reactions—When Is an Adverse Drug Reaction Not an Adverse Drug Reaction?

Paul Leber, M.D.[1]

When is an adverse drug reaction (ADR) not an ADR? Why, when it's not due to drug, of course! When is it not due to drug? When it's due to something else! A child's riddle? Perhaps, but the questions asked are not uncommon ones in both clinical drug research and clinical practice.

The solution to the riddle may or may not be straightforward. When a treatment-emergent event is "characteristic," uncommon in the absence of drug, and occurs in the appropriate temporal relationship to drug administration (i.e., acute dystonia occurring in a young male shortly after beginning on haloperidol), the causal role of the drug seems reasonably established. Moreover, in some circumstances, dechallenge and rechallenge of the patient (if safe and ethical) may provide additional reasons to accept the link between drug administration and the untoward event as causal.

In many circumstances, however, it is not possible to distinguish between events caused by the drug and those contemporaneously associated with drug administration by chance alone. This is especially so when the event in question is a complaint by the patient about an internal subjective state (i.e., mood, feeling, sensation) neither objectively assessable nor readily understood as a predictable pharmacological consequence of the drug's action. Dizziness, headache, light-headedness, nausea, and dysphoric affects are all examples of this sort of alleged ADR. Moreover, when the untoward event may be a sign or symptom of the patient's underlying disorder or condition, the likelihood of making an accurate assessment of the etiology of the event is even more problematic.

It is common, however, to behave as though an event has a known specific cause. The assignment of an etiology to a specific event is often justified on the basis of "clinical judgment." Why clinical judgment should be accepted as a method to certify causality and how it differs from any other "post hoc, ergo propter hoc" argument is unclear. Reflection on the matter will reveal that for all its mystique, clinical judgment is little more than a hunch, an idiosyncratic sentiment. Admittedly, the sentiment (at least in the minds of "good clinicians") is probably close to an intuitively established, experientially based, conditional probability. In the setting of clinical practice, the hunch (read conditional probability estimate) takes the form of the argument that given event "A" there is a likelihood, P(D/A) that the event is caused by drug. What might be used to estimate this likelihood?

Logic alone allows one to argue that nondrug causes of untoward clinical events fall into two conceptually distinct catagories: 1) the pathogenic (i.e., those related to the condition or disease), and 2) the pathoplastic (i.e., those related to each patient's intrinsic characteristics).

If this hypothesis is true, the incidence of clinically observed adverse events will be a function not only of drug, but of both subject- and disease-related factors.

It is, of course, impossible to estimate the relative contributions drug, disease, and population characteristics make to the incidence of untoward clinical events in naturalistic clincial practice settings. Furthermore, criterion variance, observer variance (variability attributable to differences in observer sensitivity to phenomena near their clinical threshold, technique of elicitation of clinical data, etc.), occasion variance, and duration of observation interval all contribute to uncertainty about the overall event rate, let alone estimation of specific event rates.

---

[1] Food and Drug Administration, Rockville, MD 20857.

NOTE: The opinions expressed here are those of the author, and do not necessarily reflect the views or the policy of the Food and Drug Administration.

Placebo-controlled, double-blind clinical drug trials of parallel design with randomized assignment of subjects to treatment, therefore, offer an unusually valuable opportunity to estimate the drug and nondrug contributions to the incidence of untoward events. Further, when placebo-controlled trials are conducted using the same drug in different diseases or syndromes, comparison of incidence of events between clinical trials may offer some insight into the relative contributions of disease and subject characteristics to the overall event rate (i.e., a distinction between events of pathogenic and pathoplastic origin). As we shall see, however, such inferences must be highly qualified.

One problem in the estimation of adverse event incidence is the variation in event detection and enumeration which arises because of the lack of standardized criteria for the identification of the events themselves (i.e., criterion variance). While one observer's "acute dystonia" is likely to be another's, less concurrence may be expected if "agitation" is the event in question. To some degree, criterion variance can be reduced by employing operational definitions and training raters to the criterion. Clearly, in contrast to clinical practice, this can be done in controlled multicenter clinical trials and, therefore, makes such trials a relatively reliable source of untoward event incidence data. Nevertheless, standardized criteria are only useful for relatively common and previously recognized phenomena. If new or novel untoward events emerge for the first time during trials with a new drug, prospective measures to reduce criterion variance are not possible. Post hoc adjustments of terminology, in cooperation with participating investigators, can be made, however, and may prove helpful. For example, combining several like phenomena under a single heading will reduce the number of distinct adverse events and contribute to the systematic organization and display of the drug's adverse event profile.

Events must also be described in terms of their severity. Again, the excessive criterion and observer variances, characteristic of spontaneous reports from naturalistic sources, may be reduced in large multicenter studies through the use of carefully written protocols and co-training of investigators.

Accurate estimation of adverse event incidence also requires standardized calculation. Defining incidence as the number of individuals experiencing the event divided by the number of individuals exposed seems most consistent with usual statistical practice.

Another problem is the need to account for event duration in event incidence tabulations. To some extent, severity ratings can reflect duration. For example, two headaches of identical intensity but lasting for 1 hour and 3 days, respectively, can be given differential severity gradings. This approach, however, seems somewhat unsatisfactory for it confounds duration and intensity.

While not yet in general use, life table or survivor function methodologies could be applied to this problem. For example, for a given adverse event, it is possible to construct a function which describes the likelihood of experiencing the event (adjusted for dose level or cumulative exposure) as a function of duration of exposure. For the moment, however, it would seem most critical to avoid combining adverse event incidence data obtained from studies of differing duration. While not explicitly stated, incidence figures always imply incidence during a period of specified duration. This point is often overlooked. Indeed, the author has seen instances in which unadjusted incidence figures from clinical trials of different duration have been unwittingly combined.

This brings the author to a major point. The rules for combining adverse event data obtained in clinical trials are essentially those same rules for combining efficacy data. Pooling of data should only be attempted for trials of the same design and duration into which patient samples drawn from the same population have been entered. If event incidence is a function of the disease under treatment (and the author believes that it often is), then it may be misleading to pool data obtained from clinical studies using the same drug in different diseases. Parenthetically, this point is subject to experimental verification.

Again, standard statistical applications of these principles to adverse data analysis are not widely disseminated, but it is theoretically possible to test the appropriateness of pooling adverse event data (i.e., estimate incidence vs. investigator interactions, etc.).

If these points are adhered to, it is possible to arrive at incidence figures for a spectrum of relatively common adverse events reported by or observed in patients participating in placebo-controlled trials. The proportion of subjects experiencing the event on drug and placebo can then be compared. Placebo incidence figures can be used to estimate the spontaneous rate of the event in the population.

This approach was attempted recently in the drafting of the professional product label for a new benzodiazepine anxiolytic drug product, alprazolam (Xanax©, Upjohn, 1981). Both the Food and Drug Administration (FDA) and Upjohn Pharmaceuticals were interested in reporting, in the most accurate manner possible, the "real" incidence of adverse events observed with the drug. Everyone involved in the joint effort recognized that the absolute rate of adverse events is often meaningless. Even when using identical protocols, two "trained" investigators may still detect adverse events at quite dissimilar rates. Our intent was, therefore, not to generate incidence figures for comparison with other drug products, but simply to present the incidence data in the most meaningful way possible.

Consideration was given to the possibility of presenting corrected incidence figures arrived at by either 1) subtracting the placebo incidence rate from the drug incidence rate, or 2) calculating the ratio of the drug incidence to placebo incidence. Both possibilities were rejected because they discarded valuable information. Clearly, it is more meaningful to know that an event was observed 30% of the time among drug recipients and 25% of the time among placebo recipients than it is to learn that the "corrected" incidence is 5% or the "relative incidence" ratio is 1.2.

The final tabulation of adverse events in the alprazolam (Xanax©) label was restricted to those which occurred at a frequency of greater than 1%. The choice of this cutoff point was arbitrary, but it did take into consideration the generally accepted view that typical new drug clinical trials enrolling 500 to 1,000 subjects are unlikely to be reliable at detecting events which occur with a frequency below 5% or so. For example, it is estimated that, in order to be 95% certain of detecting at least one example of a class of events which occur at a true frequency of 1% in the population, at least 300 subjects must be enrolled (Sackett, Haynes, Gent, & Taylor, 1980). It is thus very difficult to get enough events to observe statistically significant differences between drug and placebo rates when absolute rates are low.

As discussed earlier, it is exceedingly difficult to compare adverse reaction severity assessments among investigators. The Xanax© labeling attempts to give some basis for comparative judgment by presenting the incidence of intervention required because of adverse events among drug recipients. (A similar tabulation for placebo was not presented, mainly to avoid further complexity in the labeling.)

It is of interest that the alprazolam vs. placebo incidence figures reveal that it is possible to begin to identify when an ADR is not an ADR.

Whereas drowsiness (a pharmacologically predictable event) among alprazolam recipients was observed at a rate approximately double that of placebo recipients, other observed "traditional" ADRs are subject to different interpretations. For example, light-headedness, confusion, dry mouth, constipation, diarrhea, blurred vision, and weight gain were observed at essentially similar rates in both treatment groups. Depression, headache, insomnia, nervousness, and palpitations occurred at lower frequency among alprazolam-treated subjects. Thus, not only do the ADR incidence figures illustrate the epiphenomena of anxiety, but the comparative incidence figures support the anxiolytic efficacy of alprazolam.

It will be of considerable interest to examine the ADR rates for alprazolam and placebo when and if its efficacy is evaluated in conditions other than anxiety. This may permit some distinction between events commonly reported by subjects in any drug study (pathoplastic phenomena) and those which are more rationally explained as epiphenomena of the condition under treatment (pathogenic phenomena).

Before closing, however, it is critical to emphasize that, at best, untoward event incidence figures are imprecise estimators of true ADR rates. This should be borne in mind when one must assess the claims of commercial sponsors about the relative incidence of ADRs observed with their product and its competitors. Even among studies involving only a single active drug and placebo, it is virtually impossible to decipher the meaning of rates reported from clinical studies conducted by different investigators, in different patient samples, receiving different amounts of drug in different environmental settings in different historical epochs. Comparisons among two active drug products are even more complicated because, in order to be useful, they must compare patient samples receiving therapeutically equivalent dosages of drug. In short, comparisons of ADR incidence, even if based on data obtained from "poolable" clinical studies of similar design and execution, require cautious interpretation.

Brief Reports and Reviews—

The Brief Psychiatric Rating Scale for Children[1]

John E. Overall, Ph.D.,[2] and Betty Pfefferbaum, M.D.[2]

Introduction

The Brief Psychiatric Rating Scale for Children (BPRS-C) has been developed to provide a parsimonious description of childhood emotional and behavioral disorders. Beginning with an extended description of the symptom and behavior characteristics associated with some 18 Diagnostic and Statistical Manual-III (DSM-III) categories, the methodology of factor analysis was used to identify clusters of symptoms that define major independent dimensions of difference among the diagnostic groups. Whereas the DSM-III includes specific, and sometimes rather arbitrary, criteria for a large number of childhood diagnoses, it is important to recognize that a relatively few major symptom and behavior dimensions separate those more numerous diagnostic groups. The BPRS-C is designed to characterize individual patients, and to evaluate treatment responses, in terms that are relevant for a variety of different diagnostic classifications. Thus, the multidimensional BPRS-C is considered appropriate for description of major differences among child and adolescent patients and for characterizing such patients according to major syndrome groupings, as well as for the evaluation of treatment responses in longitudinal research designs.

Factor Analysis

In the factor analysis that provided the basis for development of the BPRS-C, the original data consisted of descriptions of hypothetical typical patients in some 18 diagnostic groups recorded on the 63-item Children's Psychiatric Rating Scale (CPRS) (Guy, 1974) by five experienced child and adolescent psychiatrists. The 18 diagnostic groups were selected from the DSM-III in an attempt to represent the range of clinical conditions most likely to be seen in the practice of child psychiatry. The five judges were asked to record what they considered from personal clinical experience to be the most likely level of symptom severity for typical patients in each of the 18 diagnostic groups. This produced 5 × 18 = 90 symptom and behavior rating-scale profiles representing a range of different types of childhood disorders. It is relevant to note that the CPRS rating scale on which the diagnostic stereotypes were recorded antedates the newly revised DSM-III, and that it includes symptom and behavior manifestations that span a broad domain of childhood psychopathology. The factors resulting from the analysis are thus conceived to be primary dimensions of symptom and behavior manifestations useful for describing differences among childhood psychiatric disorders in terms other than the specific diagnostic criteria of the DSM-III.

Intercorrelations among the 63 CPRS symptom variables across the 5 × 18 = 90 diagnostic profiles provided by the five expert judges were first factor-analyzed by a cluster-oriented powered vector method (Overall & Porterfield, 1962) to identify seven relatively independent variables which represent distinct domains in the symptom measurement space. An oblique marker variable factor analysis (Overall, 1974) was then accomplished, starting with marker variables identified in the preliminary orthogonal powered vector factor analysis. This resulted in a good oblique simple structure in which most of the 63 variables projected substantially on only one of the seven oblique reference axes. The results from this factor analysis have been reported in some detail elsewhere (Pfefferbaum & Overall, 1981).

The BPRS-C includes three key variables to represent each of the seven empirically-identified factors. Care was exercised to avoid logical redundancies in the selection of symptom variables associated with each factor. That is, the several variables that projected primarily on each factor were inspected, and three variables were chosen for incorporation into the BPRS-C that appear to represent conceptually distinct manifestations of psychopathology that should be susceptible of separate evaluation even though they relate to a single primary factor in the larger symptom domain. In some cases, highly related symptom variables were combined into a single new rating construct for inclusion into the BPRS-C. Each of the seven empirically identified factors is thus represented by three conceptually distinct symptom constructs which appear in consecutive sequence in the BPRS-C format. A facsimili of the 21-item BPRS-C is presented in Figure 1.

BRIEF PSYCHIATRIC RATING SCALE FOR CHILDREN (BPRS-C)

Patient ______________________________

FIGURE 1

Factor Scoring of the BPRS-C

The 21 symptoms of the BPRS-C are rated for severity on 7-point scales ranging from "not present" to "extremely severe." The items are grouped into subsets of three to form a basis for the scoring of the composite factors which are conceived to represent the major ways in which one type of childhood disorder differs from another. Factor scores are calculated by summing the ratings on the successive subsets of three consecutive scales. This consecutive grouping of items representing each factor was chosen, not only to facilitate factor scoring, but to provide for considered comparison of the relative levels of severity of closely related symptoms. Although the symptoms within each group of three relate to the same factor, it is important to recognize that they may differ in severity in individual patients. Such differences are easier to consider when the symptom constructs are adjacent in the rating scale format. Each symptom should be rated separately, with severity in relation to associated symptoms considered carefully.

The breadth of the domain of psychopathology spanned by the BPRS-C suggests that not all factors are relevant for description of each type of patient. The seven major factor constructs and the symptom rating variables that are combined to define the associated factor scores are presented on the left-hand side of the Table. The DSM-III childhood diagnoses for which each major factor is considered to be particularly relevant are listed on the right. These diagnostic relevances were identified empirically from factor score profiles in the original 63-item data set that was analyzed to define the seven factors.

Table

Factor Scoring of the Brief Psychiatric Rating Scale for Children and the Childhood Psychiatric Diagnoses in Which Each Factor Is Represented

Factors	Diagnoses
I. *Behavior Problems* Uncooperativeness Hostility Manipulativeness	Conduct Disorders (all types) Attention Deficit Disorders Oppositional Disorders Pervasive Developmental Disorder Infantile Autism Schizophrenic Disorder Major Depression
II. *Depression* Depressive Mood Feelings of Inferiority Suicidal Ideation	Major Depression Agitated Depression Retarded Depression Depression (other)
III. *Thinking Disturbance* Peculiar Fantasies Delusions Hallucinations	Pervasive Developmental Disorder Infantile Autism Schizophrenic Disorder
IV. *Psychomotor Excitation* Hyperactivity Distractibility Speech or Voice Pressure	Attention Deficit Disorder Pervasive Developmental Disorder Infantile Autism Schizophrenic Disorder Agitated Depression
V. *Withdrawal Retardation* Underproductive Speech Emotional Withdrawal Blunted Affect	Avoidant Disorder Schizoid Disorder Elective Mutism Retarded Depression
VI. *Anxiety* Tension Anxiety Sleep Difficulties	Separation Anxiety Overanxious Disorder Identity Disorder Anorexia Nervosa Agitated/Anxious Depression
VII. *Organicity* Disorientation Speech Deviance Stereotypy	Traumatic Brain Injury Organic Brain Disorder (other) Infantile Autism Pervasive Developmental Disorder Schizophrenic Disorder

Brief Psychiatric History for Children

For both research and clinical purposes, it is useful to have selected history and demographic information recorded in a standard format. The relevant background data in the case of children with emotional and behavioral problems include demographic characteristics of the family as well as the child. In our own research, the background data form shown in Figure 2 is used to ensure the systematic recording of at least these minimum items of background information. The Brief Psychiatric History for Children (BPH-C) is printed on the reverse side of the BPRS-C for convenience in use. As the data base grows, numerous interesting questions concerning the relationships of manifest psychopathology in children to background characteristics and family context can be answered. For comparative purposes, it may be useful to have similar information collected in different settings.

It will be noted that a section has been included for recording a tentative DSM-III diagnosis. Although a diagnosis made on the basis of brief contact with the child and parents is at best tentative, such a diagnostic impression is another way of characterizing or describing the patient. The fact that the symptom description recorded on the BPRS-C is not intended to be sufficient for diagnosis is emphasized. In children, as in adults, symptom descriptive classification and diagnosis are two different things. Examination of the phenomenological heterogeneity within major diagnostic categories may lead to eventual refinement of diagnostic concepts. The relationships between manifest psychopathology in children and DSM-III diagnosis should in fact be an interesting focus of future research with the BPRS-C.

Interviews with Parent and Child

The interviews used to obtain information necessary for completing the BPH-C and the BPRS-C rely heavily on the interviewing skills of the experienced clinician, who may be a child psychiatrist, child clinical psychologist, or other mental health professional with training and experience in working with children. The interviewer will be described as a psychiatrist in this discussion simply to avoid redundancy in reciting a list of qualified professionals.

An individualized style which allows the interviewer to maximize rapport is considered most important. Clinical skills unique to the individual can be capitalized on in a flexible semi structured interview. Nevertheless, a format that may help to eliminate extreme variation in the mode of data acquisition will be proposed here. It should allow ample opportunity for assessment in a reasonably short period of time. The use of such flexible, semistructured interviews has been documented to produce adequate reliability and validity in the assessment of children (Graham & Rutter, 1968; Rutter & Graham, 1968) as well as adults (Hedlund & Vieweg, 1980).

An interview with one or both parents, or a guardian, is required. The interviewer is encouraged to begin with open-ended questions regarding the child's presenting emotional and/or behavioral problems. Each identified problem is covered in depth with specific regard to onset, duration, and severity of symptoms. Once each problem has been discussed, a more structured format is used to obtain information for the BPH-C and the various symptoms to be rated on the BPRS-C. Specific queries should relate to activity level, attention span, speech development and possible abnormalities, emotional relationships, mood, suicidal ideation, self-concept, tension or anxiety, vegetative symptoms, fantasies, and delusions or hallucinations. A medication history should also be obtained in the interview with the parent. This interview can usually be completed in 35 minutes.

The interview with the child includes an assessment of the child's perception of his problems and an age appropriate mental status examination. As with the parent interview, this interview begins in an unstructured format allowing the interviewer to establish rapport and observe the child's behavior. Play or other modes of relating may be used depending on the child's age and condition. In the unstructured portion of the interview, the clinician can pay particular attention to activity level, attention span, peculiar mannerisms, speech production and abnormalities, manner of relating, mood, affect, self-concept, preoccupations, tension or anxiety, and delusional thinking or hallucinations that are spontaneously manifest.

During the structured portion of the examination, specific tasks may be assigned to the child in order to ascertain the child's developmental level, attention span, and ability to accept direction. Specific questions regarding friendships, school progress, mood, suicidal ideation, preoccupations, fears, fantasies, and unusual experiences or perceptions should be asked. The nature and severity of any positive findings should be explored in detail.

Since the BPRS-C is intended for research use, it is important to standardize the source of infor-

mation used in making the ratings. We recommend that the symptom and behavior ratings be based on direct observation of the child, although important leads derive from the prior interview with the parent. Some research protocols may specifically authorize the use of information derived from other sources; however, in general, the psychopathology should be verified in the interview with the child.

After completing the history and BPRS-C, the psychiatrist is asked to make an initial diagnosis of the child. It is understood that the diagnosis may be based on all information available to the psychiatrist, even though the symptom ratings on the BPRS-C are restricted to information verified in the child interview. The initial diagnosis should be recorded by checking the most appropriate DSM-III diagnosis in the box at the lower right-hand corner of the BPH-C form. In addition to providing past and current medication use, the psychiatrist is also asked to list medications which he intends to start after this initial assessment. If he decides to discontinue any current medications, that should also be noted under new medications.

Conclusion

Much work needs to be done to establish the BPRS-C as a reliable and valid instrument for characterizing childhood psychopathology. We believe that the initial development based on factor analyses of ratings descriptive of a wide range of diagnostic entities has produced an instrument with desirable balance for the representation of different types of psychopathology. Because the BPRS-C is intended for use with different types of patients, it is not expected that all symptoms and behaviors will be present in each patient. Preliminary work has suggested, however, that some of the symptoms, and their combinations into factor scores, are relevant in assessing the severity of psychopathology in each of the major diagnostic groups that were considered in development of the instrument.

Because appropriate evaluation of a new assessment device is best accomplished in the context of ongoing research, we have chosen to present the BPRS-C at this time so that it can be considered in the public domain — an instrument that can be used and evaluated by anyone who has a research program into which it can be usefully integrated. Data for assessing internal consistency reliability and concurrent or predictive validity can also be obtained by the use of the BPRS-C and BPH-C in routine clinical practice, where those data can provide standard descriptive information not inappropriate for retention in the patient's file.

On the Clinical Response/Serum Level Relationship for Antidepressants II: Lofepramine and Imipramine

John E. Dutt, Ph.D.[1]

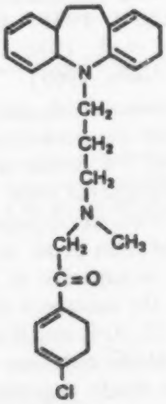
Introduction

In a recent paper by the author (Dutt, 1981), five clinical studies involving amitriptyline (A) and its main metabolite nortriptyline (N) were retrospectively evaluated. In that report, attention was focused on three subgroups of responders, since they tended to be more homogeneous than the full study population. The three groups of responders were:

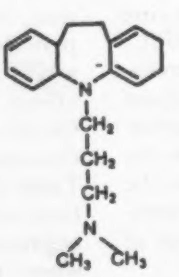
1) *ALL* responders—Defined as at least a 40% reduction in Hamilton Depression Scale (%Ham– =l≥40%) scores and a final Ham-D score of 16 or less.
2) Responders for which nortriptyline levels were higher than amitriptyline levels.
3) Responders for which amitriptyline levels were higher than nortriptyline levels.

In the responder groups, there was a pattern of higher correlations between clinical response and steady-state serum level parameters involving both amitriptyline and its metabolite nortriptyline.

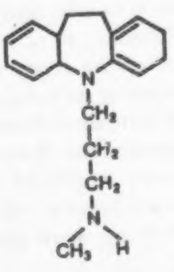
The focus of this paper is on two tricyclic antidepressants, imipramine and lofepramine (Eriksoo & Rohte, 1970; Ply n Forshell, Siwers, & Tuck, 1976; Siwers, Freyschuss, Hamberger, et al., 1970). These compounds have structures similar to desmethylimipramine (DMI), the main metabolite of each drug. The chemical structures of all three compounds are shown below:



Lofepramine



Imipramine



Desipramine

Three studies are re-evaluated here—the studies of Gram, Reisby, Ibsen, et al. (1976) and Olivier-Martin, Marzin, Buschsenschutz, et al. (1975) involving imipramine alone, and the double-blind study of D'Elia, Borg, Hermann, et al. (1977) and Siwers, Borg, D'Elia, et al. (1977) comparing lofepramine and imipramine. Individual patient data from a fourth study, the Glassman, Perel, Shostak, et al. (1977) study of imipramine, were unavailable.

In comparing data from different studies, it is essential that there be comparable inclusion criteria, comparable operational definitions of clinical response, uniform handling of data, and a population that can, in fact, respond to the drug (Dutt, 1981; Feighner, Robins, Guze, et al., 1972). Clinical response, which is operationally defined as percent reduction of total depression score from pretreatment to the appropriate posttreatment period, is identified by either percent reduction in Ham-D (Hamilton, 1960) or percent reduction in Cronholm-Ottosson Depression Scale (CODS) (Cronholm & Ottosson, 1960). Depending on the availability of data in each study, the clinical response/steady-state serum level relationship was examined for those most frequently encountered parameters—parent drug (lofepramine or imipramine), the metabolite desmethylimipramine (DMI), metabolite to parent drug ratio (DMI/parent drug), and total serum level (DMI + parent drug).

Additionally, in the double-blind study (D'Elia et al., 1977; Siwers et al., 1977) of imipramine and lofepramine, relationships involving percent norepinephrine (NE) reuptake inhibition after treatment were examined. This latter parameter, which relates to the role of NE as a neurotransmitter in central monoamine nerve terminals, has been found to correlate well in in vivo and in vitro studies with DMI (Plym Forshell, et al., 1976).

The lack of homogeneity of the study populations is again handled by focusing on subgroups of responders, since they tend to be more homogeneous than the full study population. Because responders are used, however, it should not be assumed that significant correlations will inevitably be obtained. The following three groups of responders are considered:

1) *ALL* responders—Defined as at least a 40% reduction in Hamilton Depression Scale (%Ham-D$\downarrow \geq 40\%$) scores and a final Ham-D score of 16 or less, or a 40% reduction or more in the CODS scores and a final CODS score of 7 or less.
2) Responders for which the percent of DMI to the parent drug is greater than or equal to 1.
3) Responders for which the percent of DMI to the parent drug is less than 1.

The data are further treated uniformly across studies by imposing the intake criteria of either Ham-D equal or greater to than 18 or CODS equal or greater than 12, and by employing identical statistical methods.

Method

Four studies with adequate sample sizes examined the relationship of clinical response/serum level in patients treated with imipramine for primary depression. These are the studies of Glassman et al. (1977), Gram et al. (1976), Olivier-Martin et al. (1975), and Siwers et al. (1977), which are summarized (Sets 1-4) along with the lofepramine part of the Siwers et al. double-blind study (D'Elia et al., 1977; Siwers et al., 1977) (Set 5). Two desipramine studies (Friedel, Veith, Bloom, & Bielski, 1979; Khalid, Amin, & Ban, 1978) (Sets 6 and 7) are included in Table 1 for discussion purposes. In addition to the Glassman et al. study (1977), there are several other imipramine studies with either insufficient or unavailable data (Malitz & Kanzler, 1969; Moody, Tait, & Todrick, 1967; Muscettola, Goodwin, Potter, et al., 1978; Nagy & Treiber, 1973; Sathananthan, Gershon, Almeida, et al., 1976; Walter, 1971; Watt, Crammer, & Elkes, 1969).

In the four study sets (Nos. 2-5) under evaluation, both in- and outpatients were treated for periods of 3-6 weeks with a fixed dosage except where reductions were necessary because of side effects. With the exception of a subgroup in the Olivier-Martin et al. study (1975), the reported outcome is negative in all four sets. As noted in Table 2, the numbers of nonresponder/nonqualifiers are 12, 9, 6, and 8 in Sets 2-5, respectively. A negative study outcome seems assured, therefore, when the study population contains proportionately large numbers of nonresponder/nonqualifiers. A similar observation was noted with amitriptyline studies (Dutt, 1981).

Table 1

Summary of Significant Results from Seven Study Sets

Study Sets	*N*	Sample (In/Out Pts)	Treatment Period	Efficacy Parameter	Serum Level Parameters[1] Parent	DMI	Parent + DMI	Time of Signif.
1. Imipramine (Glassman et al.)	60	Full In	4 wks	Global (Wk 4)	—	—	Sig[2]	Wk 4
		42[3] In			—	—	0.48**	Wk 4
2. Imipramine (Gram et al.)	24	In	4-5 wks	Tot Ham-D[4] (Endpoint)	—	—	N.S.	Endpoint
3. Imipramine (Olivier-Martin et al.)	24	Full In	3 wks	%Ham-DI (Wk 3)	N.S.	N.S.	—	Wk 3
		11[7] In			N.S.	0.70*	Sig[2]	Wk 3
4. Imipramine (Siwers et al.)	19	In/Out	3-5 wks	CODS[5] Amelior. (Wk 3)	—	N.S.	—	Wk 3
					Additional Findings[6] at Wk 3			
					%NE+ vs. DMI $(r = 0.86^{***})$			
					%NE+ vs. %CODS+ (N.S.)			
5. Lofepramine (Siwers et al.)	20	In/Out	3-5 wks	CODS Amelior. (Wk 3)	N.S.	N.S.	N.S.	Wk. 3
					Additional Findings[6] at Wk 3			
					%NE+ vs. DMI $(r = 0.82^{***})$			
					%NE+ vs. %CODS+ (N.S.)			
6. Desipramine (Friedel et al.)	25	Out	3 wks	Tot Ham-D (Wk 3)	/	−0.365*	/	Wk 3
7. Desipramine (Khalid et al.)	20	Out	6 wks	Ham-D Amelior. (Wk 4)	/	0.57* ($N = 15$)	/	Wk 4
				(Wk 6)	/	N.S. ($N = 10$)	/	Wk 5

---

[1] Little or no attention was given to ratios, either D/I or D/L.

[2] Exact figures were not reported.

[3] Significant global response/I + DMI relationships were also found for unipolar nondelusional depressives ($r = 0.436^{*}$, $N = 30$) and bipolar depressives ($r = 0.882^{*}$, $N = 12$).

[4] Total Ham-D was reported to be well correlated with %Ham-D.

[5] Cronholm-Ottosson Depression Scale (CODS).

[6] %NE = % norepinephrine (NE) reuptake inhibition from Week 0.

[7] Endogenous depressives who did not receive concomitant medication.

*, **, and *** denote significance at $p <$ .05, .01, and .001 levels, respectively.

Table 2

Responder/Nonresponder Numbers in Relation to Intake Depression Score and Reported Study Outcome in the Seven Study Sets Under Discussion

Study Sets	Median Score at Intake	Responders[1]	Non-Responders	Non-Qualifiers[2]	Reported Outcome
1. Imipramine (Glassman et al.)	— (N = 60)	31	29	—	Positive
	— (N = 42)[4]	25	17		
2. Imipramine (Gram et al.)	21.5 (N = 24)	12	9	3	Negative
3. Imipramine (Olivier-Martin et al.)	27.9[3] (N = 24)	15	8	1	Negative
	— (N = 11)[4]	10	1	—	Positive
4. Imipramine (Siwers et al.)	16 (N = 19)	13	5	1	Negative
5. Lofepramine (Siwers et al.)	16 (N = 20)	12	4	4	Negative
6. Desipramine (Friedel et al.)	16[6] (N = 26)	16	10	—	Negative (Inverse Relation)
7. Desipramine (Khalid et al.)	24 (N = 10)	4	6	—	Negative[5]

[1] Based on the uniform criterion (improvement ≥ 40%; Final score ≤ 16 [Ham-D] or ≤ 7 [CODS]) except study sets #1 and #3. In study sets #1 and #7, the responder/nonresponders are as reported by the authors, and in study #3, according to %Ham-D↓ ≥ 40% only.

[2] A nonqualifier failed to have a score at intake of either Ham-D ≥ 18 or CODS > 12.

[3] Mean score reported by authors.

[4] Subgroup.

[5] As noted in Table 1, a positive outcome was reported for Week 4.

[6] Median score reported by authors.

Statistical analyses included the Spearman correlation coefficient (Conover, 1971) as in Tables 3-5, and the 95% confidence interval for medians as in Figure 1. When statistical significance was found with the Spearman correlation coefficient, this was checked with three additional correlation coefficients:

1) A Pearson based on clinical response as measured by %Ham-D↓ or %CODS↓. These scores were correlated with the logarithms of the serum level parameters.
2) A Spearman based on clinical response as measured by total Ham-D or CODS at treatment endpoint.
3) A Pearson based on clinical response as measured by total Ham-D or CODS at treatment endpoint and logarithms of the serum level parameters.

Table 3

Comparison of Correlation Coefficients Based on Steady-State Serum Levels Averaged over Weeks 4 and 5 for Imipramine Responders from the Gram et al. Study

Time Period	%Ham-D↓ vs. I	%Ham-D↓ vs. D	%Ham-D↓ vs. (I + D)	%Ham-D↓ vs. D/I
Week $3^{1,2}$ ($N = 9$)	+0.62*	N.S.	N.S.	N.S.
Endpoint^{1,2} [Wk 4 or 5] ($N = 1$)	+0.84**	N.S.	0.47†	N.S.

[1] Because of a 1-week placebo period, Weeks 3, 4, and 5 correspond to Days 28, 35, and 42, respectively.

[2] For all responders except one, D/I > 1.

†, *, and ** denote significance at $p < .10$, .05, and .01 levels, respectively.

Table 4

Comparison of Correlation Coefficients with Serum Level Parameters at Week 3 for Imipramine Responders from the Olivier-Martin et al. Study

Grouping	%Ham-D↓ vs. I	%Ham-D↓ vs. D	%Ham-D↓ vs. (I + D)	%Ham-D↓ vs. D/I
D/I < 1 ($N = 4$)	0.90*	0.80*	0.90*	N.S.
D/I ≤ 1 ($N = 11$)	N.S.	N.S.	N.S.	N.S.
ALL ($N = 15$)	N.S.	0.41†	0.36†	0.41†
Endog^1 ($N = 10$)	N.S.	0.52†	0.58*	N.S.

[1] Subgroup of endogenous depressive patients identified by Olivier-Martin et al.

† and * denote significance at $p < .10$ and .05 levels, respectively.

Table 5

Comparison of Correlation Coefficients with Serum Level Parameters at Week 3 for the Imipramine^1 and Lofepramine^2 Responders from the Siwers et al. Study

	Lofepramine			Imipramine		
	With Min. Intake (CODS ≥ 12)	Without Min. Intake		With Min. Intake (CODS ≥ 12)	Without Min. Intake	
Relationships	Resp. ($N = 12$)	Resp. ($N = 15$)	Total ($N = 20$)	Resp. ($N = 13$)	Resp. ($N = 14$)	Total ($N = 19$)
1. (%NE^1) vs. (DMI)	0.80**	0.86***	0.89***	0.92***	0.92***	0.92***
2. (%CODS^1) vs. (DMI)	0.55*	0.24	0.30†	0.20	-0.11	0.8
3. (%NE^1) vs. (%CODS^1)	0.71**	0.36†	0.33†	0.23	0.26	0.14
4. (%NE^1) vs. (DMI/Parent Drug)	0.90***	0.85***	0.80***	Not Available		
5. (%CODS^1) vs. (DMI/Parent Drug)	0.62**	0.40†	0.40*	Not Available		
6. (%CODS^1) vs. (DMI + Parent Drug)	0.51*	0.25	0.29	Not Available		

[1] Imipramine was not measured in serum.

[2] For all lofepramine responders, D/L ≥ 1.

%NE^1 = %Norepinephrine (NE) reuptake inhibition from baseline (Week 0).

%CODS^1 = %Total Cronholm-Ottosson Depression Score (CODS) reduction from baseline (Week 0).

†, *, **, and *** denote significance at $p < .10$, .05, .01, and .001 levels, respectively.

manu. 49

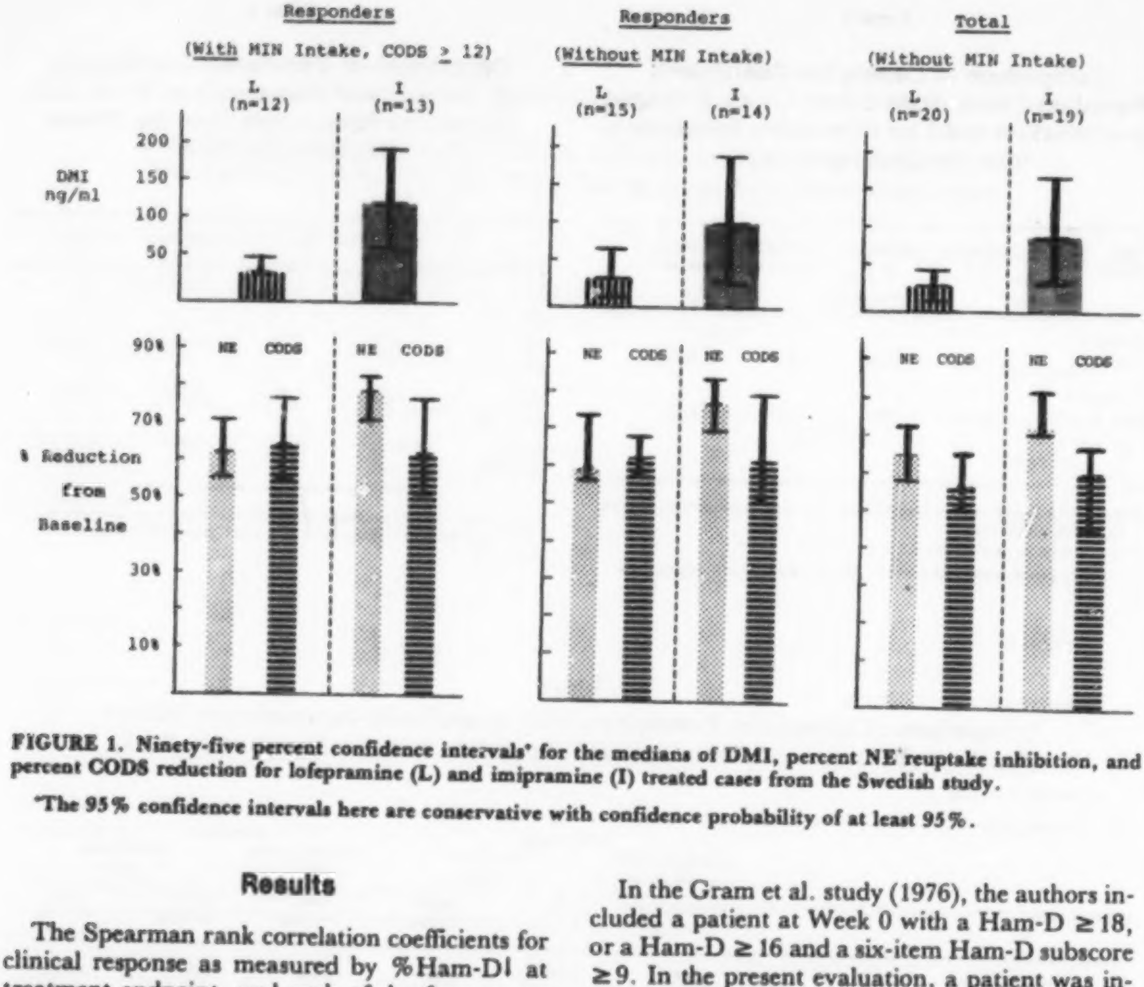

FIGURE 1. Ninety-five percent confidence intervals* for the medians of DMI, percent NE reuptake inhibition, and percent CODS reduction for lofepramine (L) and imipramine (I) treated cases from the Swedish study.

*The 95% confidence intervals here are conservative with confidence probability of at least 95%.

Results

The Spearman rank correlation coefficients for clinical response as measured by %Ham-D↓ at treatment endpoint, and each of the four serum level parameters I, DMI, I+DMI, and DMI/I are given in Tables 3 and 4, corresponding to Studies No. 2 (Gram et al., 1976) and No. 3 (Olivier-Martin et al., 1975), respectively. For the imipramine and lofepramine responders from the Swedish study (Siwers et al., 1977), a comparison of Spearman correlation coefficients for six relationships, with and without a minimum intake condition of CODS≥12, is available in Table 5. Correlations are primarily computed for ALL responders, without breakdown into DMI/parent drug subgroups, since either imipramine (Swedish study) was not measured or the proportions of (DMI/parent drug < 1) responders were relatively few.

In the Gram et al. study (1976), the authors included a patient at Week 0 with a Ham-D ≥18, or a Ham-D ≥16 and a six-item Ham-D subscore ≥9. In the present evaluation, a patient was included if the average of Ham-D at the beginning (Day 0) and end (Day 7) of the 1-week pretreatment placebo period was >18. Average Ham-D was also used in computing the %Ham-D↓ at Week 3, and at endpoint for Table 3. Because of the 1-week placebo period, Weeks 3, 4, and 5 here correspond to Days 28, 35, and 42, respectively.

In the Olivier-Martin et al. study, unfortunately, intake depression scores are not available so that the number of nonqualifiers with Ham-D ≥18 could not be identified. Because the authors reported a statistically significant correlation for an endogenous depression subgroup of 11 patients, results for responders (10 out of 11) are given in the last row of Table 4.

In Set No. 2 (Gram et al. study), as noted in

Table 3 for ALL responders, statistically significant correlations were found with imipramine (I) serum levels both at Week 3 ($r=0.62^{*}$) and at treatment endpoint ($r=0.84^{**}$). A considerably weaker correlation ($r=0.47$) was found with total serum level. Correlations with D or D/I were not significant.

In Set No. 3 (Olivier-Martin et al. study), for ALL responders weak statistically significant correlations are indicated in Table 4 with D, I+D, and D/I. When ALL responders are subdivided into D/I subgroups, significant correlations are found when D/I <1 with I, D, and I+D but for small sample sizes ($N=4$). For the endogenous depression responders, significance is found with D and (I+D) which is consistent with the findings of Olivier-Martin et al., as noted in Table 1. A computational check reveals that somewhat higher correlations are obtained in this case with Pearson's method, which was used by Olivier-Martin et al., than with the Spearman rank order correlation.

In the Swedish study, in which imipramine (Set No. 4) and lofepramine (Set No. 5) are compared, the invoking of a minimum intake depression score (CODS ≥ 12), as indicated in Table 5, seems to have significant beneficial effects for the lofepramine responders. With the minimum intake requirement, for ALL responders the correlations for all six relationships in Table 5 are statistically significant. In particular, with regard to clinical response and %NE↓, DMI/L was found to correlate better than DMI. Lofepramine itself did not correlate with any parameter.

The picture is less clear for the imipramine responders, partly because imipramine was not measured in serum. Outside of the relationship of DMI and %NE↓, which was found to be significant for both imipramine and lofepramine (Siwers et al., 1977), no significant results were found.

The median values of DMI, %NE↓, and %CODS↓ with their 95% confidence limits for the total groups and ALL responders are given in Figure 1. Within each treatment, the parameter medians for responders are not appreciably different from those of the total group.

The median DMI levels, however, are significantly lower for lofepramine (37-38 ng/ml) than for imipramine (87-114 ng/ml). Correspondingly, the median %NE↓ values are somewhat lower for lofepramine (61-66%) than for imipramine (75-78%). Only minor differences were noted between the two treatments in the medians of %CODS↓, 59-63% for the total groups, and 64-66% for responders. Therefore, the responders achieved a median clinical response of about 65%, with median DMI levels of about 37 ng/ml (lofepramine group) and about 114 ng/ml (imipramine group).

In an effort to tie together clinical response with both %NE↓ and DMI, the difference Δ = (% reduction of CODS − % NE reuptake inhibition) is plotted against DMI for each of the lofepramine and imipramine responders in Figure 2. The graph is divided into four quadrants depending on DMI levels <50 ng/ml or ≥ 50 ng/ml together with values of $\Delta > 0$ or $\Delta \leq 0$.

From Table 6, it is noted that without regard to $\Delta > 0$ or $\Delta \leq 0$, most lofepramine cases had DMI levels ≤ 50 ng/ml, while most imipramine patients had DMI levels ≥ 50 ng/ml, and this difference is statistically significant (Part A). Although the sample sizes are small, there are higher proportions of responders for DMI levels ≥ 50 ng/ml (Part B).

Table 6

Proportions of Patients and Responders with DMI < 50 ng/ml and DMI ≥ 50 ng/ml in the Siwers et al. Study†

A. Proportion of Patients

Drug	<50 ng/ml	≥50 ng/ml
Lofepramine	13	3
Imipramine	5	13

$\chi^2 = 7.69$, significant at $p < .01$

B. Proportion of Responders

Drug	<50 ng/ml	≥50 ng/ml
Lofepramine	69.2% (9/13)	100% (3/3)
Imipramine	60.0% (3/5)	76.9% (10/13)

†All numbers denote the number of patients that satisfied intake CODS ≥ 12.

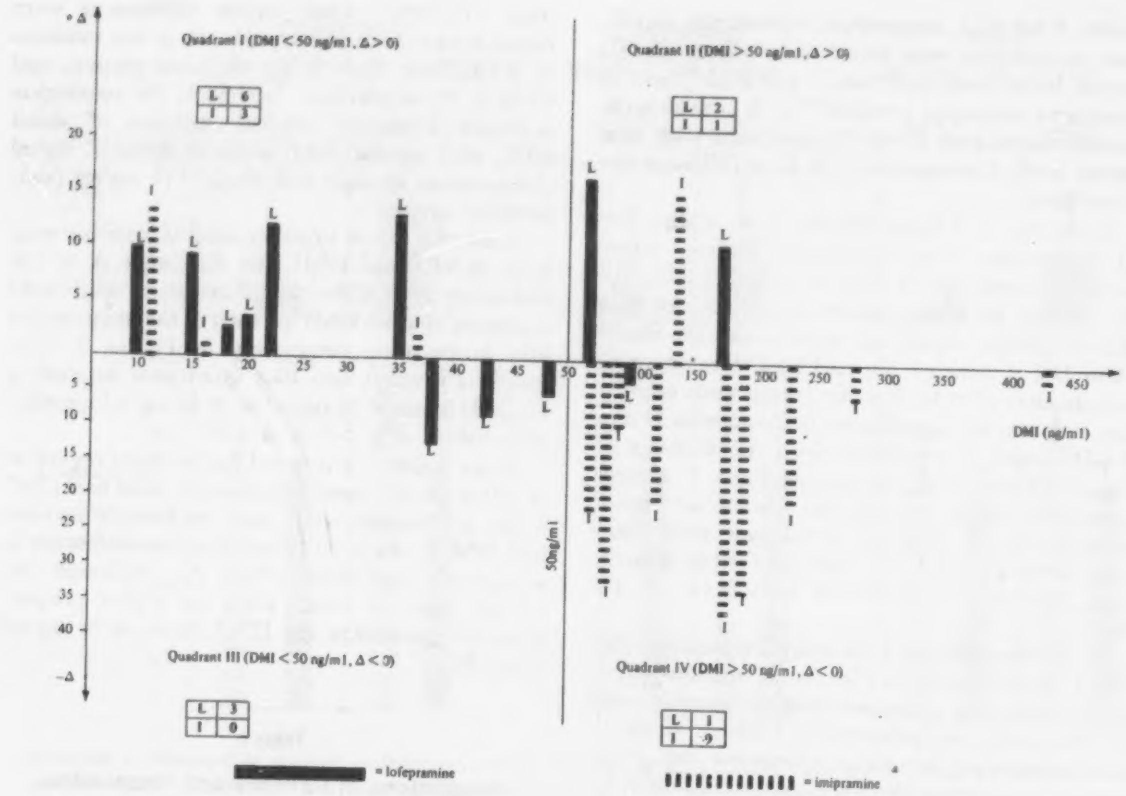

FIGURE 2. The difference Δ (% CODS reduction − % NE reuptake inhibition) as a function of DMI for the responders in the Swedish study.

Table 6 (cont'd.)

C. Proportion of Responders in Quadrants I and IV

Drug	Quadrant I (< 50 ng/ml, Δ < 0)	Quadrant IV (≥ 50 ng/ml, Δ < 0)
Lofepramine	6	1
Imipramine	3	9

$\chi^2 = 4.33$, significant at $p < .05$

D. Proportion of Responders as a Function of Δ

Drug	Δ > 0	Δ > 0
Lofepramine	8	4
Imipramine	4	9

When Δ >0 or Δ ≤0 is taken together with DMI levels <50 ng/ml or ≥50 ng/ml, most lofepramine responders are in quadrant I (<50 ng/ml and Δ >0) and most imipramine responders are in quadrant IV (≥50 ng/ml and Δ ≤0), and this difference is statistically significant (Part C). In terms of Δ alone, most lofepramine responders have Δ >0, and most imipramine responders have Δ ≤0, but the separation is not statistically significant (Part D).

This discrimination property of Δ stems from the fact that the same level of clinical response (median 65%) was achieved with each drug but with substantially lower DMI levels after lofepramine treatment. Since DMI and %NE↓ are highly correlated (Table 5—Relationship 1), and since DMI is lower after lofepramine treatment, %NE↓

is also lower. With the same clinical response but lower %NEI, Δ, therefore, tends to be positive more often with lofepramine treatment. Alternatively, with imipramine treatment, Δ tends to be negative more often.

Discussion

In the past (Asberg & Sjoqvist, 1978; Glassman, Hurwic, & Perel, 1973; Gram, 1977; Hammer, Martens, & Sjoqvist, 1968; Hollister, 1969; Kupfer, Pickar, Himmelhoch, & Detre, 1975; Petit, Spiker, Ruwitch, et al., 1977; Poldinger & Stille, 1969; Preskorn & Biggs, 1978), there has been considerable emphasis on the role and associated problems of serum/plasma/blood-level monitoring of tricyclic antidepressants. The resolving of study inconsistencies that obscure the clinical outcome/serum level relationship, however, is necessary if the value of serum level monitoring is to be realized. The pattern of difficulties, noted previously (Dutt, 1981) in the amitriptyline studies, is also evident in the imipramine studies evaluated here, as may be seen from Table 7.

Table 7

Proportion of Responders/Nonresponders' as a Function of Total Serum Levels (DMI + I) or (DMI + L)

Study	R/NR	DMI/Parent < 1		DMI/Parent ≥ 1		ALL	
		< 220	≥ 220	< 220	≥ 220	< 220	≥ 220
Imipramine	R	0	1	(5	5)†	(5	6)†
(Gram et al.)	NR	3	1	3	2	6	3
Imipramine	R	1	3	4	7	5	10
(Olivier-Martin et al.)	NR	—	—	—	—	1	7
Imipramine	R	—	—	—	—	8	6
(Siwers et al.)	NR	—	—	—	—	4	1
Lofepramine	R	0	0	(12	0)*	(12	0)*
(Siwers et al.)	NR	1	0	3	0	4	0

'The nonqualifiers are not included.

†Confirmed significant clinical response/serum level relationship with only the parameter I.

*Confirmed significant clinical response/serum level relationships with parameters DMI, DMI/L, and DMI + L.

In the three imipramine study sets, it was only possible to obtain confirmed statistical significance with one parameter in the Gram et al. study. The numbers of responders with total serum level ≥ 220 ng/ml in those three studies are relatively large, viz., 6, 10, and 6. On the other hand, with the lofepramine responders, confirmed statistical significance occurred in three parameters: DMI, DMI/L, and (DMI + L), while for any responder the total serum level did not exceed 220 ng/ml. These results are consistent with what was previously reported for amitriptyline studies. In other words, there is a greater likelihood of confirmed significant results when the number of responders for which total serum level ≥ 220 ng/ml is small (Dutt, 1981).

With regard to the two desipramine studies (Friedel et al., 1979; Khalid et al., 1978) summarized in Tables 1 and 2, again, the large numbers of nonresponders present a problem. In the Friedel et al. (1979) study, an inverse relationship ($r = -.365$) between clinical response and DMI and hence a negative outcome was reported for the full study group. Dropping the large number (10) of nonresponders and focusing on responders (10) with 50 ng/ml < DMI < 200 ng/ml, a positive outcome is possible. In the Khalid et al. (1978) study, there are too few responders for analysis.

The analyses with the lofepramine responders revealed a number of interesting findings. For example, the use of the somewhat stringent intake criterion (CODS ≥ 12) appeared to substantially improve the likelihood of finding statistically significant clinical response/serum level relationships. It is recalled from Table 5 that all six relationships were significant. In addition, the ratio DMI/L was found to correlate better than DMI. It is not clear why this occurred. All lofepramine responders had DMI/L > 1.

The relationship of NE reuptake inhibition and clinical response needs to be explored further in patients that respond to other antidepressant drugs. The finding that most lofepramine responders have Δ > 0 while most imipramine responders have Δ < 0 is certainly interesting. It would be useful to see if Δ, as a function of metabolite serum levels, has a discriminating role with other tricyclics. On the other hand, as is always the case, it would be desirable to see if these findings could be duplicated in additional studies with lofepramine and imipramine.

This evaluation suggests again the desirability of having large numbers of patients who respond to the drug. Stringent intake criteria for all patients and subsequent dosage adjustment for those patients with total serum levels ≥ 220 ng/ml can increase the likelihood of predicting clinical outcome from serum levels. Hopefully, with these and other measures to improve sample homogeneity, there will be a greater body of consistent study results for tricyclic antidepressants.

Acknowledgments: The author is grateful to Dr. Karl Rickels, University of Pennsylvania, for helpful discussion and, at EM Labs, to Ms. Amy Huang and Ms. Shiow Chen for the computer results. Thanks also to Dr. Lothar Herrmann at Leo in Sweden for details on the lofepramine data and to Dr. Khalid for his raw data on desipramine. Finally, the author acknowledges the efforts of the Editor to improve the clarity of this paper.

Models of Cognitive Impairment: Cognitive Changes in Depression[1]

Herbert Weingartner, Ph.D.,[2] and Edward Silberman, M.D.[2]

Introduction

Cognitive dysfunctions are an integral aspect of the behaviors evident in depression. One of the most obvious clinical expressions of depression is reflected in how these patients experience and describe themselves, significant others, and their environment. These subjective as well as observed cognitive changes can appear as alterations in the perception, organization, interpretation, and meaning of a large variety of events or stimuli. Past events, stimuli in the present, as well as future events are appreciated in qualitatively different ways from the nondepressed state. Depressed patients also experience and demonstrate difficulties in concentration, attention, memory, and other aspects of information processing. That is, while depressed, there appear not only qualitative changes in cognition, but quantitative changes as well, and the efficiency or effectiveness of information processing is compromised in the depressed state. The clinical and experimental studies reviewed here demonstrate that these qualitative and quantitative changes in cognition are complex and highly variable in form. The purpose of this review is to outline and structure what we have learned about cognition in depression. Some of these findings can be clinically useful. They also may teach us some things about the psychobiology of mood and cognition. Finally, we consider some of the questions that remain to be answered and propose some directions for further study and research.

A remarkable diversity of studies has been completed to date. Some of the findings come from clinical studies using clinical assessment tools. In other studies, patient populations have been examined using laboratory based methods and procedures. Still other studies have tested unimpaired subjects, manipulated their mood, and then examined changes in cognition. Methods have varied with respect to the types of subjects studied, the definition of depression, the theoretical framework that has been used to interpret cognitive responses, and the nature of the cognitive response that has been used as the target behavior.

The structure of this review is as follows. The findings that describe changes in the *form* of cognition (qualitative changes) and the *effectiveness* of those cognitive processes (quantitative changes) in depression will be reviewed separately. Some of these cognitive changes will then be compared to the changes in cognition apparent in other disorders, particularly those evident in early-stage dementia. An underlying theme throughout the review is whether there are distinctive features to the cognitive changes in depression that differentiate them from forms of cognitive impairment associated with other states. We then consider why it is difficult to integrate the available data base on cognition in depression. A framework is provided that may be useful both in integrating aspects of cognitive processes apparent in depression and in providing methods and interpretative schemes for further study. Finally, we describe some of the major questions that remain to be answered by such future study.

---

Qualitative Changes in Cognition in Depression

Three types of findings have supported the contention that depressed patients think about, interpret, and remember events in a manner that is different from processes apparent in the undepressed state. Psychodynamic formulations of depression have been one basis of these findings. Cognition in depression is considered in terms of a recapitulation of processing strategies used during some early developmental stage. Observed cognitive behaviors in depression, such as helplessness, passivity, and dependence, are then interpreted within a context of the consequences of a developmental history, and disruptions in stages of that history. This view of cognitive processing in depression has been reformulated on the basis of versions of experimentally based learning theories (operant theories, behavior modeling theories, and cognitive versions of behaviorism) as developed within experimental psychology, and have served as an important basis for describing the qualitative changes in cognition in depression. A second basis for describing qualitative changes comes from studies in which mood is manipulated, using a variety of laboratory procedures. Here the strategy is to model or mimic the types of mood changes evident in depression and then characterize related changes in cognition. A third source of data has been generated from studies that have used information processing models to examine alterations in the form of cognition in depression. In these studies, mood-state is viewed as a form of context for encoding processes and retrieval processes. In other terms, mood states are defined in terms of their stimulus properties, in much the same way that a drug manipulation is associated with unique stimulus properties. A mood-state then serves to bias the form of cognitive processing in a unique manner.

During the past two decades there have appeared a number of different kinds of studies, each demonstrating that life events, a particular developmental history, and other factors result in a pattern of cognitive behaviors which are then related, or determine the experience of depression (Brown, Sklair, Harris, & Burley, 1973; Forrest, Fraser, & Priest, 1965; Jacobs, Prusoff, & Paykel, 1967; Paykel, 1975; Paykel, Myers, Drenelt, et al., 1969). In these studies, it would appear that depressed patients think about past, present, and future events differently from what is apparent in the undepressed state. In some instances, these studies have served as a basis for formulations of cognitively focused theories that would describe the etiology of depression and what maintains depressive symptoms. For example, Beck has conceptualized the cognitive aspects of depression as reflecting a negative view of self, lowered self-esteem and decreased motivation, and related specific and systematic distortions that serve as a primary integrative theme for depressed cognition (Beck, 1967, 1971, 1974). Beck has argued that dysfunctional cognitions are, in fact, at the heart of what constitutes the experience of being depressed. Cognitively, depressed patients overgeneralize, selectively abstract information, are susceptible to some arbitrary forms of interference and, most important, minimize positive consequences and maximize negative consequences. These last issues or observations have been used by Seligman (1971) in his reformulation of Beck's theory. This has taken the form of the "learned helplessness" theory in depression. The phenomenon has been produced in animals (Maier & Seligman, 1976) and manipulated or modeled in man as well as used to describe cognition in depressed subjects. Depression is viewed as the result of learned helplessness or the expectation that outcome or consequences are response-independent. Feelings of helplessness are considered the focal behavior in depression and are operationalized as expecting consequences to be independent of what one does in some situation (Abramson, Seligman, & Teasdale, 1968; Seligman, 1971, 1975). In depression, patients expect unfavorable events to occur, feel they have no control over those negative consequences and, as a result, demonstrate passivity and a negative cognitive set. Another type of cognitive-theoretical formulation that is superficially similar to a learned helplessness description deals with internal vs. external loci of control and how these are altered in the depressed state (Hiroto, 1974). Such a theoretical position has been used to interpret attributing failure to self, and self-blame for some outcomes as particularly characteristic of depressed patients (Klein & Seligman, 1976; Rizley, 1978).

Another form of cognitive theory that seems to account for the uniqueness of cognitive processes in depression deals with perceived competence or ability to effectively cope with the environment. Lewinsohn has described the cognitive experience of depression in terms of impairments in social competence. Depressed patients are less interpersonally and socially skilled (Lewinsohn, Mischel, Chaplain, & Barton, 1980), and, therefore, less interpersonally effective. Yet another theory about the nature of the qualitative changes in depressive cognition has been suggested by Bandura in terms of the notion of self-efficacy. He argues that individuals have cognitive schemas that involve their conviction about whether they can successfully execute some behavior that is required of them, one that would produce some desired outcome. Expectations of personal mastery effects both the initiation and persistence of such coping behaviors. The strength of an individual's conviction about his own effectiveness will determine how much effort he will extend and how long he will persist in the face of obstacles and adverse experiences. The stronger the perceived self-efficacy, the more active will be his efforts in dealing with a stressful situation. Successful performance encourages a positive view of self and, in turn, the more positive the view, the more likely is the individual to attempt further tasks and be successful. Self-efficacy then becomes a concept that ties an individual's view of himself with his ability to master situations, and both of these determine his perception of his previous and recent history of success and failure.

These behaviorally oriented theories of depression formulated by Lewinsohn, Seligman, Bandura, and others have spurred a good deal of interest, empirical study, and further theoretical refinement and reformulation (Abramson et al., 1968; Huesmann, 1978; Seligman, 1978). Such theories have also been criticized as too simplistic and inexact descriptions of cognitive processes, since learned helplessness models predict patterns of cognitive symptoms that do not in fact occur in depression (Buchwald, Coyne, & Cole, 1978; Costello, 1978). In addition, much of the theorizing and empirical findings in support of these cognitive theories of depression assume that a manipulation of dysphoric mood in an unimpaired subject is like depression in a mood-disorder patient. Clearly, this is an oversimplification (Wortman & Dintzer, 1978). In fact, most of the empirical studies of these cognitive models of depression have been accomplished in laboratory tests in unimpaired subjects rather than in depressed patients. For example, learned helplessness has been manipulated by altering outcome, e.g., success or failure on skill tasks, which then produces impairments in performance, cognitive and motivational changes, and alterations in the expectation of contingent reinforcement (Abramson et al., 1968). What a subject attends to after some manipulation may also be a consequence of laboratory-based failure manipulations, rather than an alteration of expectations of success and related changes in mood (Coyne, Metalsky, & Lavelle, 1980). That is, manipulation of success or failure on some complex task may primarily alter focus of attention and only in a secondary way alter expectation of success or mood. In general, however, the cognitive behaviors that follow the experience of failure have been interpreted as learned helplessness or loss of perceived competence, and these cognitive changes appear to mimic depression. Critics of these behavioral-cognitive theories point out some of their shortcomings, including the circularity in some of the reasoning. Although the theories may be descriptively useful, they nevertheless explain little about the nature of the cognitive experience of depression (Diener & Dweck, 1978). Furthermore, the major type of manipulation that has been used as an empirical basis for learned helplessness has also served to account for anxiety (Lucas, 1952), stress (Lazarus, Deese, & Osler, 1952), frustration (Lawson & Marx, 1958), and schizophrenia (Garmezy, 1966). It is also not clear from such theories why a negative cognitive set can be induced in some people and not others. Nor do these theorists specify the presence or role of these altered forms of cognitive processes in the various stages that mark the development and maintenance of depression (Blaney, 1977).

The above theories and related methods and procedures used to test them have also been used to generate strategies for cognitive manipulations in altering depressive behaviors, or forms of cognitive therapies. These cognitive therapies have been designed to reverse or alter the mediational styles and behaviors that presumably maintain depression. That is, they are formulated and used to alter the way depressed individuals think about themselves, their competence, and their expectations of success or failure. Consistent with behavioral views of psychopathology, where symptoms are the targets of change, cognitive therapies have been used to change the thinking and cognition of depressed patients. If cognitive changes are produced, it is expected to be reflected in alterations in behavior, thereby effecting changes in depression. Personal mastery initiation and persistence training in coping behaviors are just some of the manipulations that have been used to alter mood in depressed patients. These techniques have also included attentional redeployment (Coyne et al., 1980), and direct cognitive manipulations of self-esteem (Coleman, 1975; Raps, Reinhard, & Seligman, 1980), as well as manipulations of reinforcing consequences that would be expected to alter cognitive behaviors related to depression.

All of these behaviorally oriented theories and studies imply that cognition is qualitatively altered in the depressed state. This has not been tested directly in an effective manner. That is, relatively little research has been explicitly directed at characterizing empirically, qualitative, mood-state specific encoding of events, how information is organized, and how memory for past and recent events is scanned and recalled. Instead, it has been anecdotal, clinical data which has served as a basis for describing changes in how depressed patients interpret information about self, others, their environment, and their past histories. Some of these inferred qualitative changes in cognition have, in fact, been the starting point of some of the cognitive theories of depression as described by Beck (1967, 1971, 1974), Seligman (1971, 1975, 1978), Lewinsohn, Mischel, and Chaplain (1980), and Bandura (1977). Despite extensive laboratory studies in which mood is manipulated in unimpaired subjects or altered by affective illness, there is, nevertheless, little clear and direct evidence that cognition is qualitatively altered in depression. Some studies have shown that when depressed, people recall qualitatively different past events than those that they remember under normal mood-state conditions (Lishman, 1972). That is, positively charged past events are less likely to be remembered when depressed and, instead, depressed patients selectively recall negatively charged events. There are similar findings that have been reported on the basis of laboratory studies of mood and its effects on selective recall of previously processed events. For example, in laboratory studies in which mood is manipulated by a success-failure condition (on a skill task), there appears to be selective and biased recall of positive and negative feedback that differentiates depressed patients from control subjects (Nelson & Craighead, 1977). Depressed patients selectively underestimate the frequency of positive reinforcement even while accurate in estimating the frequency of contingent negative consequences received during the performance of some skill task. A similar type of finding has been obtained in tests of depressed subjects in estimating correct responses on a pseudo-social intelligence task (Wener & Rehm, 1975). Unimpaired subjects who are induced into experiencing a depressive-like mood, as opposed to experiencing a happy mood, required a longer time to retrieve pleasant memories when happy and demonstrate decreased response latencies in recalling unpleasant memories when happy (Teasdale & Fogarty, 1979). All of these studies suggest that mood-states bias the accessibility and retrieval of information already in memory (Weingartner, Miller, & Murphy, 1977). Depressed patients, in recalling recent biographical (episodic) events, are far less likely to recall positively valent material than either neutral or negatively charged information (Breslow, Kocis, & Belkin, 1981). There are also aspects of the cognitive styles of depressed patients that are employed in recalling recent events, that differentiate them from subjects with normal mood. The depressed patient is far more likely to be preoccupied with, or attend to, past events than events that occur either in the present, recent past, or future (Wyrick & Wyrick, 1977). Other studies have been designed to examine the perception of recent life-stress events and have found that depressed patients report more stressful recent events than controls (Brown et al., 1973; Forrest et al., 1965; Hammen & Cochran, 1981; Jacobs et al., 1967; Paykel et al., 1969), although this may not relate to the actual occurrence of more frequent prior life stresses. The depression-related cognitive style, and changes in how past and present events are scanned and interpreted, are also reflected in alterations in self-schemata or perception of self. These self-schemata changes then also result in alterations in how information about self is organized in the depressed mood-state. Together, these findings seem to all suggest that the cognitive styles of depressed patients are, in fact, different from those apparent under normal mood-state conditions. The kinds of attributes of stimuli that are attended to, the types of past events, the valence of those past events, all seem altered in depression. These qualitative changes may also play a role in defining the nature of the quantitative changes that are apparent in depression. What is less clear is whether such qualitative cognitive changes are also evident in patients even after they have recovered from their depression.

The other form of empirical and theoretical evidence that suggests that cognitive process in depression is qualitatively different from that used normally, comes from studies of state-dependent or dissociative learning under mood-altered condition. State-dependent or dissociative studies were first accomplished in animal learning paradigms, comparing performance under a variety of acquisition and retrieval conditions. These studies have shown that the stimulus properties of drugs can serve as discriminative stimuli biasing the type of response that is elicited from some repertoire (Overton, 1968, 1971). Animals taught a response in a drugged state seemed to "forget" that response in the undrugged state. These dissociative effects have been attributed to discriminative stimulus properties of the drug, where responses are uniquely tied to stimuli represented by some drug-altered state. Similar effects have been demonstrated in drug-state-dependent learning studies in man (Goodwin, Powell, & Bremer, 1969; Weingartner, 1977; Weingartner, Adefris, Eich, & Murphy, 1976). On the bases of these studies in man, it has been possible to demonstrate that memory dissociations occur when events are poorly processed, and when recall is attempted by freely remembering information (Eich, Weingartner, Stillman, & Gillin, 1975; Weingartner, 1977). A number of studies have also demonstrated that the depressed mood state represents a state much like a drug state. It acts as a form of an informational context that, much like a drug, biases or determines how information is processed, encoded, and organized in memory. For example, when a patient in a depressed mood tries to remember previously processed events under normal mood conditions, there appears a form of dissociative learning and memory which is very much like that evident under drug-altered conditions. Sequences of events, such as past biographical experiences, are less likely to be remembered under a disparate mood condition, especially under free remembering conditions, but not when recall is attempted in the presence of strong cues that would ordinarily aid recall. Events that were stored while depressed are less likely to be recovered under normal mood-state conditions, and those events that were stored under normal mood-state conditions are less accessible in the depressed state (Weingartner et al., 1977; Weingartner, Murphy, & Stillman, 1978). That mood states can serve to produce dissociations which are mainly apparent in freely remembering information has been used as evidence for a change in how events are encoded or interpreted in the depressed state.

In summary, a variety of types of convergent findings have been used to infer that depressed patients process events qualitatively differently from how information is processed under undepressed mood-state conditions. However, what is lacking is direct evidence or measurement of cognitive processes themselves, rather than inferences drawn from subjects, levels of learning and memory. The types of findings that suggest qualitative changes in cognition in depression relate to the sorts of biographical experiences that come to mind, recall of reinforcing consequences (success and failure), expectations of future reinforcement, how events are organized, information about the self, and how events are encoded and tied to some mood context. These factors all serve to differentiate the cognitive processes in depression from those evident under normal mood conditions.

Quantitative Changes in Cognition

Depressed patients frequently complain of impairments in cognition. These are frequently verbalized as problems in attention, concentration, memory, and learning, and can be reflected in difficulties in solving problems, persisting on some cognitive tasks, thinking clearly, and distractability. Any or all of these experienced cognitive impairments can be evident on clinical examination, although both their expression and severity may vary widely as a function of the severity of depression and also perhaps the type of depression. In fact, the cognitive dysfunction may be severe enough so that it can resemble the profound cognitive impairments evident in progressive dementia patients.

Although there are considerable anecdotal data describing changes in the effectiveness of cognitive processes in depression, relatively little systematic empirical research has been accomplished to date. Most studies confirm the clinical description of a cognitive impairment in depression, but have not, as yet, defined a) the structure and specificity of these cognitive changes, b) the mechanisms that determine them, and c) the features of cognition during depression that distinguish them from the cognitive dysfunctions associated with other syndromes.

Most of the empirical tests or studies of quantitative changes in cognition apparent in depression have used standard psychometric or laboratory procedures to document and quantify the presence of a deficit (Stromgren, 1977). These procedures have primarily focused on attention, or memory and learning, although rarely together in the same study. Mediation or rehearsal processes that might account for changes in attention, learning, and memory have not been studied systematically. In large part, this is due to the fact that while there are many "ready-made" pretested procedures for measuring attention, learning, and memory, it is much more difficult to measure changes in underlying mediational or rehearsal processes that are hypothesized to determine the effectiveness of various types of cognitive operations.

Investigators have used one of three types of models of information processing as a basis for exploring the cognitive impairment in depression. Each of these models includes methods of approach as well as interpretative schemes for defining or describing cognitive findings. Most of the information processing studies in depression have implicitly or explicitly used some version of a stage theory or model of information processing (Atkinson & Shiffrin, 1968). These theories assume that information processing occurs in discrete stages in which the control or operating processes are different for each stage in processing and storing events, and the nature of the trace of experience is different for each stage of information processing. Aspects of attention, short- and long-term memory, retention, and retrieval are considered to be determined by different psychobiological mechanisms. Any impairment, in any single stage of information processing, would result in a failure to adequately record or recall ongoing events. This model has been used in several studies describing cognitive changes in depression. An alternative theoretical view of how information processing succeeds or fails considers learning, memory retention, and retrieval along a single continuum (Craik & Lockhardt, 1972; Craik & Tulving, 1975). This single process (or "levels of processing") framework for describing information processing has also begun to be used to describe cognitive changes in depression (Weingartner, Cohen, Martello, & Gerdt, 1981). The assumptions in this theoretical approach are very different from stage theory descriptions of information processing. Acquisition, retention, and retrieval are defined not by different mechanisms. Instead, the completeness of encoding or processing at the time of acquisition, and the relationship between retrieval context and encoding context at the time of acquisition, define the probability that learning has taken place and remembering is possible. In many instances it has been possible to show that memory fails because encoding operations have been weak or incomplete. A third type of theoretical model used to explore the nature of cognition in depression considers the events that follow information processing to be important in defining whether or not a trace of experience, a memory, is established in some relatively permanent form. The basic notion is that biological events that succeed acquisition will determine the consolidation of trace events in memory (McGaugh, 1966; McGaugh, Zornetzer, Gold, & Landfield, 1972). This model has been used almost exclusively in studies of the biology of animal learning and only more recently in studies of information processing in man (Parker, Birnbaum, Weingartner, et al., 1980; Weingartner, Hall, Murphy, & Weinstein, 1976).

A number of studies have demonstrated a relationship between the intensity or severity of depression and the extent of cognitive impairment (e.g., memory) that is present (Harness, Bental, & Carmon, 1977). In some studies, the severity of depression is directly related to impairments in long-term memory (Henry, Weingartner, Murphy, & Murphy, 1973), while other studies have shown this relationship with short-term memory functions (Sternberg & Jarvik, 1976). This difference may be one of semantics, or type of descriptors used to measure such cognitive impairments. By contrast to the above studies, it appears in some reports that the cognitive dysfunction in depression is a highly generalized nonspecific impairment in memory (Stromgren, 1977). Other interpretations of cognitive findings have suggested that memory impairment that is evident in depressed patients may simply be a function of the depressed individual using a more conservative response strategy, one that underestimates what the patient has learned and could potentially remember (Miller, 1975). It would appear that at least some aspects of the cognitive failures evident in depression are accounted for by retrieval failures in the form of increased reaction time, response inhibition, conservative response biases, or output failures, rather than an inability to attend to and acquire new information (Hale & Strickland, 1976; Harness et al., 1977).

A number of studies have also demonstrated that depressed patients demonstrate types of cognitive "blurring" in the form of illogical thinking—failures to accomplish detailed, analytic thinking—and also demonstrate difficulties abstracting, forming concepts, and organizing their experience. These same types of cognitive failures may be reflected in the form of inaffective mediational processes. It is plausible that memory changes that are apparent in depressed patients are a direct result of disruptions in those cognitive processes involved in the encoding of information at the time of acquisition. This may be reflected in the depressed patient being unable to perceive or use structure inherent to some informational input, thereby failing to acquire new information which is then ultimately reflected in failures in recall. In fact, some direct evidence substantiates the hypothesis of impaired analytic cognition, leading to memory changes. One form of this evidence is that depressed patients cluster related events less completely than unimpaired controls (Koh, Kayton, & Berry, 1973; Russell & Beekhuis, 1976). Other findings have demonstrated that depressed patients are less able to process and remember unrelated events, but are indistinguishable from controls in processing and recalling related information (Weingartner et al., 1981a).

Another category of investigation which has yielded information about quantitative cognitive changes in depression is that of neuropsychological testing. The Halstead-Reitan battery, for example, has been reported to show evidence of "right-hemisphere impairment" in two studies of depressed populations (Flor-Henry, 1979; Goldstein, Filskow, Weaver, & Ives, 1977). Such a conclusion is inferred from a pattern of test results characterized by relatively greater deficits in performance of spatial or holistic tasks compared to verbal, numerical, or sequential tasks. When tested in the remitted state, however, depressives have not shown deficits or lateralizing signs on the Halstead-Reitan battery (Small, Small, Milstein, & Moore, 1972). Other investigators have found quantitative deficits on spatial rather than verbal neuropsychological tests (Kronfol, Hamsher, deS. Digre, & Wazir, 1978), but have failed to find deficits on simultaneous as compared to sequential methods of information processing (Gur, 1979). One study has examined the Categories Test, a measure of abstract reasoning and logical ability used as part of the Halstead-Reitan battery, to compare cognitive changes in bipolar vs. unipolar depressed patients (Savard, Rey, & Post, 1980). The study concluded that while both groups showed impairment, the deficits in bipolars were much greater and, in the case of older bipolars, often fell below performance levels expected in brain-damaged subjects. Further analysis of the Savard data subsequently revealed that the greatest differences between depressed and control groups occurred on the portion of the test which is most dependent on processing of spatial information (Silberman & Weingartner, unpublished data).

A number of studies have suggested that the cognitive impairment evident in depression occurs in those situations or tasks that require effort, particularly sustained effort. For example, depressed patients are more likely to demonstrate impaired cognitive performance in freely remembering information rather than on tests of recognition memory. Memory-learning failures are also more likely when depressed patients are asked to accomplish tasks requiring elaborative processing and analysis of information, rather than conditions that require superficial processing of information. In a similar vein, memory failures in depression are less obvious on tests of immediate recall from short-term memory rather than delayed recall (Stromgren, 1977). Furthermore, when depressed patients are administered amphetamine, there is facilitation that is selective and restricted to tasks that require more effort (Reus, Silberman, Post, & Weingartner, 1979). In summary, it would appear that effortful processing tasks, those that require active and sustained cognitive activity, are the particular targets of disruption in depression. Recent cognitive studies have, in fact, suggested that different types of mechanisms are involved in automatic vs. effortful information processing (Hasher & Zacks, 1979). These processes are mediated by different psychobiological determinants (Lewis, 1979) and are disrupted differentially in different syndromes (Stromgren, 1977; Weingartner, Gold, et al., 1981b; Weingartner, Kaye, Smallberg, et al., 1981c). This hypothesis, namely that the cognitive information processing impairment in depression is related to an inability to sustain effort on some level, has been tested directly and confirmed. The ability of depressed patients to sustain motor effort is almost perfectly correlated with the intensity of the memory impairment evident in these patients and, together, these are highly correlated with the patient's intensity of depression (Cohen, Weingartner, Smallberg, & Murphy, in press).

While it remains for further study to clarify the psychobiological mechanisms that link effortful (or automatic processes) to cognitive failures in depression, a line of evidence with potential explanatory power is that of changes in balance between the cerebral hemispheres. There is considerable evidence to support characterization of the left hemisphere cognitive style as detailed, serial, or intentional, and that of the right as holistic, parallel, and incidental. In such terms, one might speculate that depressive deficits in effortful processing, that is, deficits in relatively deep analysis of semantic and organizational aspects of stimuli, may represent a decrement in left hemisphere cognitive functions. In support of such a speculation is a body of independent data, gathered in normal and brain-lesioned subjects, associating the left hemisphere with mediation of positive affective states, and the right hemisphere with mediation of negative affective states. Evidence for this hypothesis comes from such diverse experimental sources as lateral eye movement (Ahern & Schwartz, 1979), electroencephalographic (Davidson, Schwartz, Saron, et al., 1979), and electromyographic (Schwartz, Ahern, & Brown, 1979) studies in normals, and observation of patients with unilateral pharmacologic or anatomical brain lesions (Alema, Rosadini, & Rossi, 1961; Gainotti, 1972; Rossi & Rosadini, 1967). Thus, the hypothesis arises that depression may be a manifestation of right hemisphere activity.

In depression itself, there are also data which more directly suggest shifts in hemispheric balance or function as a concomitant of the ill state. Such diverse procedures as electroencephalography, dichotic listening, galvanic skin response, and lateral eye movements have shown results suggestive of a shift in the balance of hemispheric activity away from the left and toward the right hemisphere (d'Elia & Perris, 1973; Flor-Henry, 1979; Myslobodsky & Horesh, 1978). Such studies, as well as the neuropsychological testing described above, also suggest that the right hemisphere may not only be abnormally activated, but also pathological in its functioning during the depressed state (Buchsbaum, Carpenter, Jr., Fedio, et al. 1979; Rochford, Swartzburg, Chaudhery, & Goldstein, 1976; Roemer, Shagass, Straumanis, & Amadeo, 1978; Yozawitz, Bruder, Sutton, et al., 1979). While such lateralized changes might provide one conceptual framework for understanding cognitive deficits in depression, the evidence is as yet preliminary (Biegel & Murphy, 1971; Donnelly, Murphy, & Goodwin, 1976; Donnelly, Murphy, & Scott, 1975), without contradictions. A great deal more data need to be collected before the presence of laterality changes in depression is firmly established, or their relationship to the origin of the illness understood.

Distinctive Features in the Cognitive Changes in Depression: Clinical and Diagnostic Implications

The cognitive impairment evident in patients in early states of a progressive dementia can appear to be superficially similar to the cognitive changes apparent in depressed patients. This similarity in the form of the cognitive impairment in depression and progressive dementia contributes to diagnostic uncertainty and consequent inappropriate treatment strategies. The fact that early-stage dementia patients are also likely to demonstrate depressive symptomatology in response to their perceived impairments compounds the difficulties involved in establishing an appropriate differential diagnosis. The laboratory findings that have established some of the mechanisms and determinants of cognitive failures in these two different types of disorders can be useful in appropriate differential diagnoses. That is, the determinants of cognitive failures in depression, as described in some of the studies reviewed above, are qualitatively different from those that account for memory-learning-attention failures in progressive dementia patients.

What are some of the distinctive features of cognitive failure in depression that might differentiate it from the cognitive changes apparent in an early stage of a progressive dementia? Depressed patients demonstrate learning and memory failures on tasks that lack easily discernible internal structure, and where the patient must impose organization for effective learning and memory to take place. For example, while recall of random words clearly differentiates the memory-learning performance of patients from undepressed controls, patients are as able as "normals" to learn and remember inherently organized information, such as semantically related words. That this characteristic of the memory-learning failure evident in depression is different from that evident in progressive dementia is illustrated by the findings in the following experiments. The details of these experiments are presented since the methods used, and the findings, can be easily translated into clinical tools for evaluating different types of cognitive impairments.

The learning-memory performance of a group of moderately depressed patients (10 males, 10 females), characterized on the basis of standard Research Diagnostic Criterian, standardized regular mood ratings, and standard psychometric testing, was compared to age-, sex-, and education-matched controls. Subjects learned and remembered different lists of 32 words including unrelated words, and organized word lists consisting of either 2 clusters of 16 words each (e.g., vegetables, parts of a house); 4 clusters of 8 words each, or 8 clusters of 4 words each. Depressed patients recalled significantly fewer words than controls [$F(1,18) = 9.4$; $p < .05$]. The interaction of type of list and groups (depressed vs. controls) was also statistically reliable using a standard repeated measures analysis of variance (ANOVA) and including all available degrees of freedom [$F(6,108) = 3.71$; $p < .01$], as well as by a conservative analysis using Winer's correction for degrees of freedom in a repeated measures design ($p < .05$). That is, depressed patients were most distinguishable from control subjects in recall of unrelated information, and this is illustrated in Figure 1.

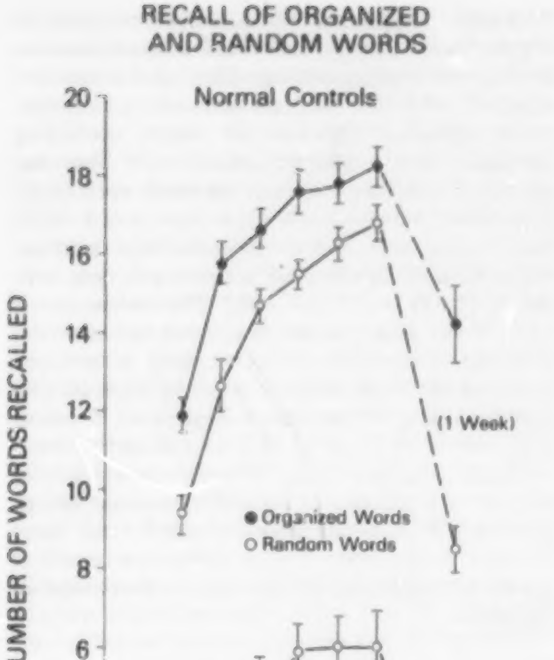

FIGURE 1. Learning and recall of random and related words by depressed patients and normal controls.

In contrast, progressive dementia patients could not use organizational or semantic relational properties of events as an aid in encoding information and, therefore, related events (words) are no more memorable than random words (Weingartner et al., 1981c). This is evident even in those patients who are no more cognitively impaired than depressed patients as measured by tests of IQ, Wechsler Memory Scale Scores, and recall of random words. Progressive dementia patients remembered about the same number of random and related events after a single exposure and after repeated presentation of information. Control subjects, as well as depressed patients, are far more successful in remembering related than random events, and this effect is enhanced with increased familiarization with that information, and also when memory is tested after a period of delay. The following experiment illustrates this aspect of the memory-learning failure in progressive dementia patients who are no more impaired than some depressed patients who have been studied using similar procedures. As will be evident, the form of the memory-learning impairment in these progressive dementia patients is quite different from that seen in depressed patients.

Fourteen patient volunteers (9 males and 5 females) were selected for further study from a much larger sample of patients after extensive systematic standardized clinical, psychometric, and neurological evaluation (for diagnostic purposes). On the basis of detailed historical, clinical, and laboratory data, a diagnosis of a progressive idiopathic dementia, probably of an Alzheimer's type, could be made. Patients, none over 65 years of age, were all in the earliest state of a progressive dementia (based on clinical data as well as psychometric findings, including IQ test scores of at least 100, and impairments in memory as measured by the Wechsler Memory Scale, normal digit span), were otherwise in good health, and were not being treated for other medical disorders. An equal number of age, education, and socioeconomic status matched control volunteers (where possible, the spouse of the patient) were also recruited and studied. Neither patients nor controls had any history of significant psychiatric disorder. Their average age was 61.2 (standard error ± 2.2), and education 14.1 years.

On separate occasions, subjects were presented with two different sets of very common words presented in a randomized sequence. One list consisted of 20 random words and the other was made up of words drawn from two superordinate categories (10 words each) of semantically related words, such as *vegetables* and *parts of the body*. After verbal presentation of each list, at a 3-second rate, immediate free recall was tested. The word list was then re—presented five times, always in a different random order, with a test of recall after each presentation. A delay period was included to measure and test the presence of information in long-term memory. Unimpaired subjects were retested 1 week after the last learning trial while progressive dementia patients attempted another recall after a delay of only 10 minutes. This shorter delay interval was a practical necessity when testing patients with significant memory impairments.

The inability of progressive dementia patients to effectively use organizational or relational properties of to-be-remembered words was evident on immediate recall, list learning, and delayed recall following multiple list presentations of random and related words. Controls consistently remembered more related than random words and this was evident on each presentation (learning) recall trial [$F(1,13) = 18.3$; $p < .001$]. This effect was increasingly evident as list learning continued (interaction of trial × lists [$F(4,5.2) = 53$; $p < .01$]. Recall of related words was also more complete than that of random words when memory was tested one day later [$F(1,13) = 17.5$; $p < .001$]. Progressive dementia patients thus demonstrated memory-learning failures when their cognitive performance is compared to unimpaired controls. More important, and unlike the pattern of cognitive failures in depression, organization did not significantly alter any aspects of learning or memory in these patients. These findings are summarized in Figure 2.

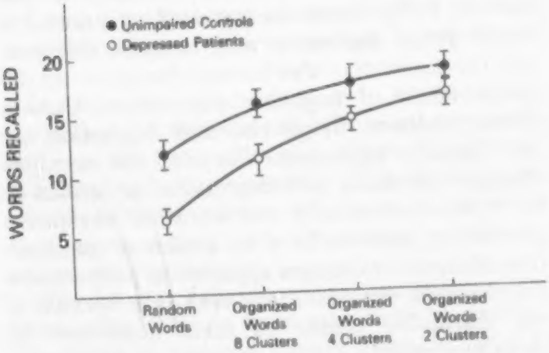

FIGURE 2. Learning and recall of random and semantically related words in patients with a progressive dementia and unimpaired controls.

As described above, laboratory studies of depressed patients demonstrate that learning and memory fail as a function of the difficulty, effort, or cognitive load required in some task. Compared to controls, depressed patients demonstrate more obvious and robust impairments when they are directed to learn and remember information (intentional learning) rather than for incidentally learned information (Weingartner et al., 1981a), when information must be "held" in memory for long rather than short time periods, for more difficult types of learning such as remembering serial order, or under more stringent and demanding remembering conditions such as free recall. As was pointed out above, the cognitive failures in depression are far less evident on "easier" cognitive tasks such as those that involve relatively "automatic," effortless, or passive operations. In contrast, progressive dementia patients fail to learn and remember despite their sustained efforts in performing cognitive operations. Unlike depressed patients, they are particularly distinguishable from controls on "passive" or "automatic" processing tasks such as estimating how often events had occurred, in contrast to freely remembering those events (a more active effortful task). The progressive dementia patient is also different from older controls, who may demonstrate changes in learning and memory requiring effortful processing but are indistinguishable from healthy young subjects on "automatic" processing tasks.

Despite the cognitive blurring and disrupted learning and memory that is apparent in depressed patients, they are able to effectively access knowledge structures such as the semantic relationships, and attributes and meanings of events, and relate this previous learning to ongoing events. For example, when either unimpaired or depressed subjects are asked to think about and say aloud words related to categories of information (such as types of flowers, parts of a house, etc.), they do so easily and are even more productive, over a 2-minute time period, than when thinking of words that might start with the same letter. On the other hand, progressive dementia patients, in generating appropriate associations to names of categories or words all starting with the same letter, are far less productive than controls or depressed patients but, more important, are particularly unproductive in generating words that are all members of the same category (Weingartner et al., 1981c). Their productivity in generating appropriate responses from semantic memory is highly correlated with the learning-memory performance of progressive dementia patients, but this relationship is not evident in depressed patients (Weingartner et al., 1981a).

Methodological Issues

Studies that have explored cognition in depression have differed from one another in three important ways. They have varied with respect to 1) the nature of the independent variable (what constitutes depression); 2) the type of dependent measure (the target cognitive response); and 3) the assumptions and models used to generate questions about cognition in depression. Because of these differences in design, focus of study, and theoretical models used to generate studies and interpret results, it has been difficult to form a general and integrated picture of cognitive changes in depression.

Two types of independent variables have been used in cognitive studies in depression. Comparison of subject groups represents the most frequent method of manipulating depression as an independent variable. Depressed patients are often compared to some control group or to themselves in an undepressed state. One of the problems in obtaining a clear picture of the nature of cognitive changes in depression results directly from the diversity in defining what constitutes depression in some population of subjects. That is, depressed patients studied have varied with respect to the intensity of depression, forms of depressive symptoms, and sub-diagnostic categories. Studies of clinically depressed subjects have included patients who are defined as Bipolar 1, Bipolar 2, or reactive depressions, as well as other forms of unspecified clinical depressions. What can be concluded about the nature of cognitive changes in depression may be quite dependent upon not only the intensity of depressive symptoms but also the type of clinical depression that is studied. There are, in fact, data that would suggest that with respect to quantitative changes in depression, bipolar patients are more likely to demonstrate more profound changes than any other subgroup of depressed patients. Unipolar and bipolar patients, for example, have been found to differ in presenting symptomatology, Rorschach response style, and Minnesota Multiphasic Personality Inventory (MMPI) profile.

It is also not clear to what extent cognitive changes in depressed patients are state vs. trait specific. Little work has been done examining the nature of cognitive processes in patients who have recovered from some depressed episode. This type of data represents just one source of information that is necessary for appropriate evaluation and definition of cognitive changes associated with depressed states.

Other studies have defined depression as the independent variable by choosing to contrast subjects that are drawn from other than clinical populations. These have examined essentially unimpaired subjects in the psychology laboratory. In general, subjects have been selected on the basis of large sampling strategies using some standard psychometric test instrument. Depression is then defined on the basis of statistical rather than clinical criterion. A large variety of scales have been used as methods for defining such subgroups of subjects. The MMPI, the Zung, and Hamilton Depression inventories, standard clinical interviews, life-stress event scales, hopelessness scales, as well as more behaviorally and less subjectively focused scales, were designed to measure cognitive bias in depressed mood (Blaney, Behar, & Head, 1980; Hammen, in press; Krantz & Hammen, 1979; Sarason, Johnson, & Siegel, 1978; Seligman, Abramson, Semmel, & von Baeyer, 1979). These measures of behaviors that would define depression may be quite different, and the scales may also be anticipated to tap different facets of cognitive experience. Unhappiness, sadness, dysphoria, and depression are not logically equivalent. Clearly, the cognitive changes associated with depression, as defined by some psychometrically and statistical evaluation procedure, may not be at all similar to the structure of cognitive changes apparent in patients who are clinically depressed and seek help because of the disruptive effects of their experience of dysphoric mood.

The other method of defining depression, the independent variable for study, is through some behavioral manipulation of mood. Those behavioral manipulations have primarily been directed at affecting mood changes in unimpaired normal controls under laboratory test conditions. These mood-induction procedures have been useful in inducing mild depression, which is presumed to model the kinds of dysphoric moods that are evident in depressed patients. Frequently, the manipulations used are conceptually tied to studies that would test behavior-oriented models of depression. Two types of manipulations have been used. One has involved the use of some informational context. For example, a subject may be asked to read statements that describe various moods. These are then used to provide a contextual mood-altered setting for processing information about self and others (Velton, 1968). Many subjects, when asked to read statements with dysphoric content, rate themselves as depressed, which may then be reflected in cognitive behaviors as measured by response latency and speech patterning (Natale, 1977) and other measures of cognitive efficiency. A second commonly used technique for altering mood has involved manipulations such as feedback on some task that requires skill, as in the form of a success vs. failure manipulation (Diener & Dweck, 1978; Hammen & Krantz, 1976) on a skill task. It can also involve a manipulation of reinforcing consequences or informational feedback on some task which may affect self-esteem (Coleman, 1975). Other behavioral manipulations may induce a form of helplessness through experimenter-induced failure (Abramson et al., 1968). In all of these approaches what is being tested is how a manipulation of mood, through informational or behavioral means, may affect aspects of information processing, problem solving, interpersonal perceptions, or perceptions about self. The assumption is, again, that these alterations in mood that are a product of behavioral manipulations are like those evident in depressed patients. Whether such manipulations of mood in unimpaired subjects mimic the types of cognitive changes associated with depression remains an unanswered question.

The nature of the dependent variable has also been quite different from one study to another. The kinds of cognitive measures that are used to assess performance in depressed patients, recovered patients, or normal subjects after some manipulation of mood have been quite variable. The cognitive response may be one that assesses how thoughts are organized, what is remembered, the meaning of prior-life events, how well a complex cognitive behavior is accomplished, the effectiveness in interacting with an information-rich environment, concept attainment, encoding of self, or significant others. Clearly, the kinds of changes in cognition that would occur in the depressed state would be expressed rather differently depending on the type of cognitive behaviors used as target measures for cognitive changes.

The theoretical models and assumptions that are used both to generate strategies for looking at depression and interpreting findings are also quite different from one another. These have included biological, behavioral, information processing, and psychodynamic models of depression. Unfortunately, both the nature of the findings that have been generated and their interpretation have not been easily integrated and synthesized. In part, this is due to the intrinsic differences in the language systems used to describe events in biological psychiatry, psychodynamic theory and application, and behavioral approaches to psychopathology. Investigators speak one of these languages and not others. It is, therefore, particularly difficult to relate findings generated from those very different conceptual schemes for the analysis of behavior.

There remain many unresolved questions about the psychobiology of cognitive processes in mood disorders. A good deal of work has been done, but more remains to be accomplished.

What might be some productive themes for future investigations? Clearly, cognitive changes that are apparent during periods of disordered mood must be evaluated and contrasted with cognitive processes during normal mood states in these same patients. This requires following patients systematically over time. It may also be useful to evaluate first-degree relatives of these same patients or subjects who may be considered to be at risk for affective illness. Are cognitive processes in these patients, mood-state specific or trait specific, and do the types of cognitive processes used by these subjects, while unimpaired, predict or make these subjects vulnerable to a mood disorder? Further research in this area should allow for more effective and deliberate integration of clinical material, findings from unimpaired subjects where mood is manipulated, behavioral views of mood disorder, and information processing characterizations of cognition in mood-disorder patients. Without such integration of methods, findings, and interpretation of findings, this area of study will remain as a series of isolated efforts without the necessary research leverage that permits us to answer basic questions about cognitive processes in mood disorders.

Last, and a related issue, is the fact that although we have learned a great deal about the biology of mood disorder and about the psychology of disordered mood, surprisingly little research has been accomplished that would bring these two types of research endeavors together in a systematic manner. This may be most effectively accomplished in considering cognitive processes in the mood disorders.

Electroconvulsive Therapy: Research Goals

Section Editors:

Richard Abrams, M.D., Professor and Vice-Chairman, Department of Psychiatry, University of Health Sciences/The Chicago Medical School, No. Chicago, IL 60064.

Jack Blaine, M.D., Research Psychiatrist, Pharmacologic and Somatic Treatments Research Branch, National Institute of Mental Health, Rockville, MD 20857.

This special section of the *Psychopharmacology Bulletin* is devoted to the proceedings of two conferences held in Chicago on November 13-15, 1980 and January 29-31, 1981.[1] The purpose of these meetings was to review the present "state-of-the-art" with regard to electroconvulsive therapy (ECT) research and to generate specific recommendations to the National Institute of Mental Health (NIMH) concerning the major research problems facing ECT investigators during the present decade. These conferences evolved from two prior NIMH-sponsored conferences on ECT. The first, "Psychobiology of Convulsive Therapy" (Fink, Kety, McGaugh, et al., 1974), attempted to define the cognitive, technical, physiological, and biochemical parameters of ECT as they were then known, drawing upon both human and animal studies. The conclusions of this conference were that there had been significant advances in ECT techniques, resulting in an overall reduction in the undesirable side effects of this treatment, and that the major unresolved issue concerned the mode of action of ECT.

The second conference, "ECT: Efficacy and Impact" (Autry, to be published), focused on the short- and long-term impact of ECT on the organism, and on an assessment of its clinical efficacy in a wide range of psychiatric disorders. This conference provided a comprehensive and detailed historical assessment of the convulsive therapy process, and concluded by addressing some of the critical research needs in the field, many of which served as foci for the 1980-1981 conferences.

After more than 40 years, ECT remains a widely used treatment in this country. An estimated 73,000 patients per year (4.4/10,000 population) receive this treatment (Fink, 1979) with greatest usage in the general hospital. About 72% of American psychiatrists believe it to be the safest, least expensive, and most effective treatment for many patients, and 22% of those sampled personally administer the treatment (APA, 1978).

This special section amply demonstrates that although much is known about ECT, more remains to be learned. It is our hope that these papers will stimulate others to investigate the problems detailed here, with the aim of developing a more rational and effective therapy.

The Importance of Diagnostic Criteria for Depression in the Study of ECT

Michael Alan Taylor, M.D.[1]

The keystone to quality clinical research is proper patient selection based upon reliable, operationally defined diagnostic criteria. Despite the use of sophisticated laboratory procedures or potent psychotropic agents, data from studies which do not employ rigorous patient selection cannot be generalized with any assurance, and the investigators are likely to miss real effects or report spurious findings.

Prior to the 1970s, reliable psychiatric research criteria were not available. The conflicting and confusing findings of the literature of that era, in part, reflect the lack of reliable diagnostic instruments necessary to eliminate from study the false positive subject and select homogeneous samples for investigation.

Several sets of reliable and operationally defined research criteria were developed in the 1970s (Feighner, Robins, Guze, et al., 1972; Spitzer, Endicott, & Robins, 1975; Taylor & Abrams, 1978). These criteria have permitted greater precision in subject selection and have helped clarify some of the confusion generated by older studies. The exposure of the overdiagnosis of schizophrenia and the underdiagnosis of affective disorder in the pre-1970s is perhaps the most important effect of the introduction of modern criteria (Taylor & Abrams, 1978; Pope & Lipinski, 1978).

Several categories in the nosology of mental disorders remain controversial, despite the recent advances in diagnosis. This is particularly true for the category of depression. As depression is the primary indication for electroconvulsive therapy (ECT) (Taylor, in press), a clearly defined, generally accepted concept of depression is essential for research attempting to understand the ECT process. Much of the controversy revolves around the putative validity of the endogenous/nonendogenous depression dichotomy.

As initially proposed (Gillespie, 1929; Lange 1926; Kraepelin, 1921), endogenous depression referred to a syndrome reflecting some unknown morbid process characterized by a clear-cut episode of profound and unremitting sadness associated with early morning wakening, anorexia, dry-mouth, inability to cry, constipation, a diurnal cycle in which symptoms were most severe in the morning, psychomotor retardation or agitation, and feelings of hopelessness, worthlessness, and/or guilt which often resulted in delusional ideas and/or perceptional aberrations. Reactive depression referred to a less well-defined episode of dysphoria with anxiety which was responsive or reactive to environmental stimuli and was associated with weeping, initial insomnia, weight gain, and feelings of anger. The literature evaluating the efficacy of ECT and antidepressant. agents (Taylor, in press; Fink, 1978; Prusoff, Weissman, Klerman, & Rounsaville, 1980; Nelson & Charney, 1981) clearly demonstrates endogenous depression to be extremely responsive to somatic treatment, whereas few reactive depessives respond to biological therapy and many are made worse. Despite the clear-cut distinction between the severe endogenous and mild reactive syndromes and their different responsivity to treatment, several investigators (Kendall, 1968; Lewis, 1934; McConaghy, Joffe, Murphy, et al., 1967; Weckowicz, Cropley, & Muir, 1971) were unable to discriminate the boundary between the two putative groups and concluded that the overlap was so great that the dichotomy was not warranted. Perhaps the best known works in this area are Kendall's (1968; Kendall & Gourlay, 1970a) elaborate discriminant function studies.

In these studies, variation of depressive symptomatology is expressed by a score on a linear discriminant function found from analyses of a number of items measured from patients originally diagnosed endogenous or nonendogenous. The distribution of the scores is then used to make inferences about the homogeneity of depression with a bimodal distribution indicative of subtypes and a unimodal distribution indicative of a single syndrome. In Kendall's two series a unimodal distribution was demonstrated. This has become the primary evidence in refutation of the endogenous/nonendogenous dichotomy. There are, however, several problems in interpreting this work. First, despite presenting a unimodal curve, many of the discriminant functions were significantly weighted in the predicted direction, and Kendall was able to correctly classify 86% of the sample. Secondly, although the overall distribution of discrimant functions did not differ significantly from a normal distribution, the chi-square reported comes close to significance, suggesting that measurement errors in the design (such as the significant difference in the sizes of the endogenous/nonendogenous groups and the lack of diagnostic criteria for patient selection) could have resulted in a Type II error, i.e., failing to find a real difference. Thirdly, demonstrating a bimodal distribution may be difficult, even for clearly different groups, if the two groups share more characteristics than the number which separates them or if characteristics are not properly weighted when some characteristics are more important than others at discriminating groups. For example, men and women have more physical characteristics in common than the number which clearly distinguishes them, and some of their distinguishing characteristics are more important than others. A discriminant function distribution curve of the sexes not adequately considering the overlap of characteristics or not weighting some characteristics might well be unimodal despite clear sexual dimorphism. Certainly, Kendall and Gourley's (1970b) inability to find a bimodal distribution for a sample of patients with schizophrenia or affective disorder suggests that this kind of analysis has limited usefulness. Finally, as Murphy (1964) and Everett (1981) have pointed out, bimodal and unimodal distributions of discriminant scores can be obtained at will from the same group of patients by choosing variables appropriately when samples are small (as in Kendall's studies), when putative subgroups are not well separated, or when the predicted variable is poorly defined (as may be the case for nonendogenous depression) (Akiskal, Bitar, Puzantran, et al., 1978; Nelson, Charney, & Quinlan, 1981) and by manipulating the class intervals for the distribution histogram. Nevertheless, some studies evaluating the power of "classical" endogenous and reactive symptoms to predict treatment response (Coryell, Ziegler, & Biggs, 1980), and one study comparing morbidity risks for affective disorder in the first-degree relatives of endogenous and reactive probands (Winokur & Pitts, 1964) also failed to support the dichotomous classification of depression.

Modern diagnostic criteria have been influenced significantly by these negative studies. The Research Diagnostic Criteria (RDC) and the Diagnostic and Statistical Manual-III (DSM-III) attempt to finesse the issue by permitting subtyping within the broad category of major depression, and by not requiring clear-cut exclusion criteria to prevent contamination between subgroups. The Feighner et al. (1972) criteria reject subtypes of depression and consider primary affective disorder homogeneous.

Nevertheless, there is significant evidence (Carroll, Feinberg, Greden, et al., 1980; Feinberg, Carroll, Steiner, & Commorato, 1979; Klerman, Endicott, Spitzer, & Hirschfeld, 1979; Nelson, Charney, & Vingaino, 1978) that the above sets of criteria select heterogeneous samples of depressives which fit more readily into the endogenous/nonendogenous classification. Feinberg's and Carroll's work (1979, 1980) typifies this literature. They and their associates challenged RDC and Feighner positive depressives, who were independently and blindly reclassified as endogenous or reactive, with dexamethasone, a highly sensitive and reliable test for discriminating depression. Forty percent of the endogenous patients failed to suppress their control levels in response to dexamethasone, whereas 98% of reactive patients showed suppression. From this and other studies, investigators estimate that of patients labeled depressed by RDC or Feighner criteria, 50 to 70% are inappropriately classified and unsuitable for research of present-day biological treatment. This estimate is supported by studies of bereavement (Bornstein, Clayton, Halikas, et al., 1973; Clayton, Halikas, & Maurice, 1972) in which nearly 50% of widowed subjects satisfied Feighner criteria for primary depression, although neither the investigators nor the "Feighner-positive" subjects felt that they were ill. There was also no evidence (e.g., past personal history of affective disorder, family history of affective disorder) that these Feighner-positive individuals were predisposed to a disease.

Further support for the endogenous/nonendogenous dichotomy derives from laboratory work studying the sedation threshold (Perez-Reyes, 1968; Perez-Reyes & Cochrane, 1967; Shagass, Neiman, & Mihalick, 1956) and growth hormone response to amphetamine (Langer, Heinze, Reim, & Matussek, 1975). The sedation threshold is defined as the amount of barbiturate given intravenously at a fixed rate which will produce specific changes in electroencephalograph (EEG) frontal fast activity consistent with a reduction in alertness. Shagass et al. (1956) first demonstrated a significantly lower-than-normal sedation threshold in endogenously depressed patients and a significantly higher-than-normal sedation threshold in reactive depressives. This work was replicated but with considerable difficulty. More recently, Perez-Reyes, in a double-blind, well-controlled study (1967, 1968) investigated the sedation threshold using the galvanic skin response (GSR) as a validating and reliable measure of sedation threshold EEG changes and found reactive depressives, normal controls, and endogenous depressives to differ significantly in the predicted direction in their response to barbiturate on both EEG and GSR inhibition. Similarly, Langer et al. (1976) in their investigation of the hypothalamic-pituitary axis in psychiatric disorders, demonstrated that peak human growth hormone release after a single intravenous administration of amphetamine was significantly lower in endogenous depressives and significantly higher in reactive depressives as compared to normal subjects and other psychiatric patients who did not differ from the normal controls.

Recent studies of the phenomenology of depression offer further support for the endogenous/nonendogenous dichotomy (Matussek, Soldner, & Nagel, 1981). Blashfield and Morey (1979) compared the results of 11 studies which used cluster analysis to discriminate subgroups of depressives. Their analysis rejected the continuum model of depression, in which the endogenous syndrome is considered the more severe form, and the investigators concluded that as a group, cluster analytic studies demonstrate two depressive syndromes, one consistent with endogenous and one consistent with nonendogenous depression. Nelson and Charney (1981) have reviewed in great detail studies employing factor analysis, cluster analysis, discriminant function analysis, symptom frequency comparisons, and objective instrumental measures correlated with behavior (e.g., EEG recording of sleep patterns, cognitive testing) and have concluded from their review and from their own data (1981) that endogenous depression is an autonomous pathophysiological state distinct from the nonendogenous syndrome. In contrast, Akiskal et al.(1978) have demonstrated the heterogeneity and instability of reactive depression.

Thus, from treatment response, symptom pattern, and biological data endogenous depression appears to be a distinct clinical entity that is particularly reponsive to somatic treatment. As the use of DSM-III, RDC, and Feighner criteria will result in the inclusion of many false positive patients who do not have the endogenous syndrome, it is important to modify these criteria for studies of affective disorder and biological therapies.

The data summarized above suggest that this modification of present research criteria for depression is best achieved by 1) selecting patients who satisfy the inclusion criteria for melancholia or endogenous depression, and 2) excluding those who demonstrate coexisting or past behaviors consistent with anxiety states or Briquet's syndrome, who have no evidence of coarse brain disease, drug ingestion, or systemic illness known to produce depressive symptoms, and who have no concurrent alcohol or drug abuse. The Table displays these suggested criteria.

The recommendation to use rigorous criteria to identify endogenous depressives for studies of affective disorder and biological treatments does not mean that all such patients have a common pathophysiology. However, if we are to progress further in our understanding of what makes people depressed and how ECT works, the best possible delineation of depressive disorder is an essential first step.

Table

Suggested Research Diagnostic Criteria for Depression (Modified from RDC)

Inclusion Criteria (all required)

1. Must have loss of pleasure in all or almost all activities, lack of reactivity to usually pleasurable stimuli (doesn't feel much better, even temporarily, when something good happens)
2. Distinct quality of depressed mood, i.e., the depressed mood is perceived as distinctly different from the kind of feeling experienced following the death of a loved one
3. Must have two of the following present nearly every day for a period of at least 2 weeks:
    - a) early morning wakening (at least 2 hours before usual time of awakening)
    - b) depression is regularly worse in morning
    - c) marked psychomotor retardation or agitation (but not merely subjective feelings of restlessness or being slowed down)
    - d) anorexia with at least 2.5 kg weight loss
    - e) excessive or inappropriate guilt (may be delusional)

Exclusion Criteria (all required)

1. No evidence of coexisting or past anxiety disorder, somatoform disorder, or disassociable disorder
2. No evidence of coarse brain disease, drug ingestion, or systemic illness known to produce depressive symptoms.

Clinical Prediction of ECT Response in Depressed Patients

Richard Abrams, M.D.[1]

Before signing consent for electroconvulsive therapy (ECT), a therapeutic measure popularly believed to be both drastic and a last resort, patients and their families want to know the likelihood of recovery with this form of treatment and whether its potential benefits outweigh its risks. Thus the need arises for practicing clinical psychiatrists to be able to predict which depressed patients are most (and which least) likely to respond to ECT.

Hobson (1953) was the first to assess the relation of various clinical and historical features to the outcome of depressed patients treated with ECT. He recorded the presence or absence of 121 clinical features in 127 patients ("almost all" depressed), eschewing diagnostic classification as "too ill-defined and too widely inclusive" for prognostic purposes. Two weeks after a course of ECT, patients were assigned to good (62%) or poor (38%) outcome groups and each of the 121 clinical features was tested for its correlation with outcome. Thirteen features were correlated significantly with outcome: five favorable (sudden onset, good insight, obsessional previous personality, self-reproach, and duration of illness less than 1 year), and eight unfavorable (mild-moderate hypochondriasis, depersonalization, emotional lability, neurotic traits in adult life, hysterical attitude toward symptoms, intelligence above average, fluctuating course, and neurotic traits in childhood). By adding to this list three "very suggestive" features (pronounced retardation being favorable, and the ill-adjusted premorbid personality, and hysterical previous personality being unfavorable), a checklist of 16 clinical and historical features was constructed to rate each patient, assigning one point for the absence of a favorable feature or the presence of an unfavorable one. The scores ranged from 1 to 14, with lower scores indicating the more favorable outcome. When the frequency distribution of scores was compared for the good and poor outcome cases, a score of 7.5 provided the least misclassification. For example, had a good outcome been predicted for each patient with a score less than 7.5, and a poor outcome for those with a score over 7.5, outcome would have been predicted successfully in 79.7% of the cases.

Roberts (1959) correctly predicted outcome after ECT in 78% of his cases using Hobson's index, but Hamilton and White (1960) found no correlation for the Hobson score and clinical outcome in 49 depressed men receiving ECT. They applied instead the technique of multiple regression analysis to the problem, choosing five variables individually correlated with outcome: duration of illness, weight, the body index, initial depression scale score, and the fall in blood pressure with methacholine, and derived a multiple correlation with improvement of +0.62 for these combined items.

Nyström(1964) selected 24 variables correlated with outcome after ECT and calculated individual prognostic values for each patient based on the partial regression coefficients of the items. Outcome was correctly predicted in 76% of the cases. Favorable features included early morning waking, retardation, and profound depression in mood; unfavorable features included seclusiveness, ideas of reference, depersonalization, obsessionality, and histrionic behavior.

Carney, Roth, and Garside (1965) constructed a predictive index (the Newcastle Scale) for patients receiving ECT by applying multiple regres-

sion analyses to find the weights for each of 35 clinical items which best predicted outcome 3 months after treatment. They selected five favorable features (weight loss, pyknic physique, early morning waking, somatic delusions, and paranoid delusions) and five unfavorable features (anxiety, worsening of mood in the evening, self-pity, hypochondriasis, and hysterical traits). Assigning appropriate regression weights to each item yielded for each patient a score that had a multiple correlation with outcome of ±0.67. Each item that correlated positively with a good therapeutic outcome also correlated with the diagnosis of endogenous depression. The Newcastle Scale was subsequently tested on a new sample of 97 depressed patients by Carney and Sheffield (1972) and found to have a 76% predictive accuracy.

Mendels (1965a) found the Hobson score to predict outcome correctly 1 month after ECT in 34 of 50 depressed patients (78%). He then constructed his own index from variables selected by item analysis for their association with a significant reduction in depression scale score after ECT (1965b). Favorable items were a family history of depression, early morning waking, delusions, and psychomotor retardation. Unfavorable items included neurotic traits in childhood or adulthood, inadequate premorbid personality, precipitating factors, and emotional lability. Mendels correctly predicted the response to ECT at 1 month in 90% of his cases and, in a subsequent study with an additional 50 cases, a slight modification of the index yielded a predictive accuracy of 86% (1967).

A few individual variables have been reported to predict a favorable response to ECT, including cyclothymic personality (Abrams & Taylor, 1974; Ottosson, 1962) and pyknic physique (Abrams & Taylor, 1974). Perris (1966) observed that bipolar patients had a better response to ECT than unipolar patients, but our own study failed to confirm this (Abrams & Taylor, 1974).

The prognostic accuracy reported for the various indices may be statistically inflated. Selecting items significantly correlated with outcome from a larger group of items tested and combining them in a coefficient of multiple correlation overestimates the relationships involved. The problem is compounded when the indices are then used to predict outcome in the sample from which they were derived. It is also necessary to consider the accuracy of the predictive indices in comparison with simply giving ECT to all depressed patients referred for treatment or only to those with the diagnosis of endogenous depression. In Hobson's study (1953), a 61.8% predictive accuracy would have been achieved simply by giving ECT to every patient. In Mendels' study (1965b), this procedure would have been correct 60% of the time. If ECT were given only to patients with well-defined symptoms of endogenous depression, the predictive accuracy would have been 72% in Mendels' study (1965b) and 73% in Carney and Sheffield's study (1972).

Abrams, Fink, and Feldstein (1973) tested the predictive value of the indices of Hobson (1953), Carney et al. (1965), and Mendels (1965b) in a sample of 76 hospitalized primary depressives referred for ECT. They found no relation between any of the three indices and improvement as measured by the residual post-ECT Hamilton Depression Scale score, adjusted to account for the variance of the pre-ECT score. In addition to the individual items needed to calculate the three indices, they assessed the presence or absence of a number of other features possibly related to outcome with ECT, including a history of mania or hypomania, cyclothymic personality, endogenous mood swings, a history of prior depression, and impaired concentration. There were 22 variables in all, none of which demonstrated a significant correlation with outcome.

In retrospect, it is felt that negative results obtained by Abrams et al. (1973) were probably due to selection bias. He studied an older group of hospitalized patients (mean age = 63.7 years) who were much more likely to fit the category of endogenous rather than reactive depression, thus virtually eliminating the powerful negative predictive variables associated with reactive depression. To test this hypothesis, an analysis was done of the data on all depressed patients who participated in a series of ECT studies conducted by Taylor and the author over a period of 10 years (Abrams & Taylor, 1973, 1974, 1976; Abrams, Taylor, Faber, et al., in press). Each patient satisfied research criteria for endogenous depression and each was blindly rated before and after a course of ECT using a modified Hamilton Rating Scale for Depression. Hierarchical multiple regression analysis was used to examine the relation between each of the depression scale items and the post-ECT depression score, which was adjusted to account for the variances of the pretreatment depression score, treatment electrode placement, sex, and the total number of treatments received. In a sample of 97 endogenous depressives, a significant correlation was found only between one individual item (gastrointestinal symptoms) and the adjusted post-ECT depression score, well within the boundaries of chance. It would appear, then, that once a population of endogenous depressives is specified, there is simply not enough variability left from which to predict outcome.

In summary, the various clinical predictive indices have only limited application today. The individual clinical features comprising each index are, after all, only manifestations (epiphenomena) of an underlying disorder of presumed biological origin, variously termed endogenous depression or melancholia. Patients with this disorder have been universally demonstrated to respond to ECT, and the predictive indices probably do little more than attempt to identify such patients more systematically than is usual. What is needed is a biological measure of melancholia which is independent of the vagaries of clinical presentation. The dexamethasone suppression test is an important first step in the development of such a measure and will doubtless be further refined, or followed by other more accurate procedures, to ultimately yield a specific test for the prediction of response to ECT. The thrust of future research into the prediction of ECT response should be along these lines.

Predictors Of Outcome In Convulsive Therapy

Max Fink, M.D.[1]

With the introduction of treatments with inherent risk for the mentally ill, such as arsenicals and fever therapy for neurosyphilis, and insulin coma, convulsive therapy, and leucotomy for schizophrenia, predictors with specificity for a favorable outcome became matters of high priority. In studies of schizophrenia, both insulin coma and leucotomy were found to have limited ap-

plications. But convulsive therapy was effective in melancholia, mania, and catatonia. A search was focused on finding an analog of the Wasserman test for syphilis—a simple procedure with high specificity for a common pathogenesis. Such identification is essential to the development of a safe and rational therapy. It is the aim of this review to cite the principal studies in the search for predictors of outcome in convulsive therapy. While no recent measure fulfills the criteria of specificity, safety, and ease of administration of the Wasserman test, the variety of measures under study, when integrated with the present knowledge of the physiologic effects of induced seizures, and the objective methods of classification of the mentally ill, provide a basis for enthusiasm in the ongoing search.

The empirical nature of convulsive therapy has led investigators to seek specific predictors of outcome in three broad dimensions—clinical criteria, personality and psychologic tests, and biochemical and physiologic laboratory tests (Fink, 1968, 1979). Much of the data of studies done between 1938 and the early 1960s, prior to the introduction of modern psychotropic drugs, are no longer applicable. The argument in the early days was the selection of patients for convulsive therapy, leucotomy, and insulin coma, with hospitalization, moral, and milieu therapies as the principal alternatives. Not only did the treatments differ, but the population samples referred to research centers differed. The present samples reflect the residue of those severe mentally ill patients already treated with active psychotropic substances. Nevertheless, a review of the early concepts provides a basis for our present studies.

Clinical Criteria

The most widely used and best criterion for the selection of patients for convulsive therapy is clinical diagnosis—the type and severity of the pathology, and the recent medical history. Despite changes in clinical typologies, represented by the general acceptance of the Research Diagnostic Criteria and the Diagnostic and Statistical Manual-III (DSM-III) schemata, patients who are severely ill, with syndromes of melancholia (endogenous depression, primary depression), catatonia, and mania have the best prognosis for short-term outcome with electroconvulsive therapy (ECT) (APA, 1978; Fink, 1978, 1979; Scovern & Kilmann, 1980; Ottosson, 1981; Kendall, 1981). ECT is also the preferred treatment for those patients with recurrent depressions who have not responded to drug treatments in the past, and who have responded to ECT.

Within the broad syndrome of melancholia, two specific subtypes are especially responsive to convulsive therapy—patients with catatonic features (Roth & Rosie, 1953; Breakey & Kala, 1977; Regestein, Alpert, & Reich, 1977; Fink, 1979), and those with delusions of guilt or somatic delusions (Hordern, Holt, Burt, & Gordon, 1963; Glassman, Kantor, & Shostak, 1975; Avery & Winokur, 1977; Davidson, McLeod, Kurland, & White, 1977; Kantor & Glassman, 1977; Nelson & Bowers, 1978; Minter & Mandell, 1979a,b; Kaskey, Nasr, & Meltzer, 1980; Charney & Nelson, 1981). These patients respond poorly to tricyclic antidepressant medications (Rao & Coppen, 1979; Brockington, Kendell, Kellett, et al., 1978). There is also a subgroup of patients with confusional syndromes, such as the unusual cases of acute delirium, periodic confusional states, and delirious states complicating organic illnesses who respond dramatically to ECT, often to only a few treatments (Ottosson, 1981).

Many authors proposed prognostic indices, based primarily on symptoms and observable clinical signs (Hobson, 1953; Carney, Roth, & Garside, 1965; Mendels, 1965, 1967; Nyström, 1965; Pilowsky & Boulton, 1970; Weckowicz, Yonge, Cropley, & Muir, 1971). While these indices are useful in identifying the responsive subtypes in the initial samples, their application to new populations found them no more useful than clinical diagnosis alone, and they have not been generally adopted (Abrams, Fink, & Feldstein, 1973; Kiloh, 1977; Ottosson, 1981; Kendell, 1981). A good response is associated with the "endogenous features" of terminal insomnia, morning aggravation, self-denigration, weight loss and anorexia, retardation, and agitation. It is possible that the vegetative symptoms which are given the most weight in these indices reflect features in the pathogenesis of a syndrome of melancholia, which is particularly responsive to induced seizures. As these symptoms are associated with dysfunction of brainstem mechanisms, particularly hypothalamic-pituitary functioning, it is not unexpected that some recent concepts of the mode of action of ECT focus on dysfunctions of these structures (Fink, 1979; Fink & Ottosson, 1980).

Psychologic Tests and Personality Measures

Most clinicians note that an "adequate personality" is a good prognostic feature (Kiloh, 1977; APA, 1978; Ottosson, 1981). In some early studies of convulsive therapy, the relation of psychological tests to outcome was sought. Interest was shown in the syndrome of anosognosia and denial of illness—a syndrome which is seen in patients with generalized dysfunction of the brain. It is exaggerated by the administration of sedative drugs, like amobarbital (Weinstein & Kahn, 1955). In patients undergoing ECT, the development of an organic mental syndrome is easily documented, with the severity of the syndrome proportional to the number and frequency of seizures. In such patients, a denial personality (Kahn & Fink, 1959), high acquiescence score on social attitude scales (Kahn, Pollack, & Fink, 1959, 1960a), errors on figure-ground tests (Kahn, Pollack, & Fink, 1960b), and restricted performance on the Rorschach test (Kahn & Fink, 1960) were associated with a good clinical outcome (Fink, 1968, 1979). These studies also found that older patients of foreign birth had better prognoses with ECT than younger patients who were native born in the U.S. (Kahn et al., 1959). These tests never achieved general acceptance, in part because interest in ECT waned as antidepressant drugs were introduced, and, in part, because there was little evidence that these tests were useful in distinguishing the patients responsive to ECT from those who responded to other antidepressant treatments.

Physiologic and Biochemical Tests

In the almost 50 years since the introduction of convulsive therapy, many physiologic and biochemical measures have been examined in relation to a course of ECT. Most studies assessed the effects of repeated seizures on body physiology, but a few examined the possibility that dysfunctions in physiologic and biochemical measures were related to prognosis (Fink 1968, 1979).

Tests of autonomic reactivity were a feature of early studies. A common index was the change in blood pressure in response to subcutaneous or intramuscular methacholine or to intravenous epineprine. The rate of change, the peak change, and the rate at which the blood pressure returned to baseline were examined, with a systolic rise greater than 50mm Hg after epinephrine and a delayed return to baseline greater than 25 minutes after methacholine as good prognostic signs for ECT (Funkenstein, Greenblatt, & Solomon 1948, 1950, 1952). These observations were corroborated, but later reports noted that the correlations could largely be explained by age and the basal blood pressure (Blumberg, Cohen, & Miller, 1956; Roberts, 1959a,b; Hamilton & White, 1960; Rose, 1962; Thorpe, 1962). Correlations were best in older patients with defined hypertension.

Electrophysiologic Tests

Others studied the resting EEG before treatment and found better clinical results in those patients with normal (alpha) EEG records than in those with low voltage fast records (Turner, Lowinger, & Huddleson, 1945; Weil & Brinegar, 1947; Kennard & Willner, 1948; Mosovich & Katzenelbogen, 1948); but others failed to find such an association (Moriarty & Siemens, 1947; Chusid & Pacella, 1952). Indeed, Hoagland, Malamud, Kaufman, & Pincus (1946) found a positive relationship between the amount of EEG fast activity in the pretreatment electroencephalogram (EEG) and clinical outcome with ECT in a group of involutional depressed women.

The inflection point in the increase in EEG beta activity after the intravenous administration of amobarbital (0.5 mg/kg/40 sec) was defined as the "sedation threshold," with low thresholds being positively correlated with diagnoses of psychotic depression and good prognosis with ECT (Shagass 1954, 1957; Shagass & Naiman, 1956). These findings were confirmed by some observers (Nymgaard, 1959; Perris & Brattemo, 1963), but not by others (Ackner & Pampiglione, 1959; Roberts, 1959b).

Roth (1951) reported a better prognosis with ECT for patients in whom the resting EEG delta activity was enhanced by intravenous thiopental given a few hours after the first to third seizures. In a replication and followup study, Roth et al. (1957) reported that enhanced EEG slowing after pentothal was not related to the short-term evaluations of outcome, but to the likelihood of relapse after 3 and 6 months, with higher relapse rates in patients with lower EEG slow wave values. In parallel studies, Fink and Kahn (1957) found that the early and sustained development of high voltage EEG slow wave activity in the resting interseizure record was a good prognostic sign for short-term outcome evaluations with ECT. But this study also was not confirmed in a later series (Volavka et al., 1972; Volavka, 1974). We concluded that the earlier findings (like those with the sedation threshold and blood pressure studies) resulted from the mixed population samples (schizophrenic and depressed) studied at the time, and that such measures were not particularly useful in the more homogeneous depressed samples under study at present (Fink, 1979). The data still leave the possibility that such physiologic measures, when applied to mixed samples, identify subpopulations (such as depressed and catatonic patients) with characteristics that are particularly responsive in their behavior and physiology to induced seizures, in contrast to others (such as schizophrenic patients) who lack such responsivity.

Interest was also shown in the changes in averaged sensory-evoked responses, both as indices to identify subpopulations of the mentally ill and as indices to relate to outcome. Much of this work has been done by Shagass (1972, 1980), but its complexity and limited specificity has not encouraged its widespread use.

The sleep EEG, with measurement of rapid-eye-movement (REM) features, has been another source of indices of depressive illness and outcome with treatment. A prominent feature of depressive patients is a shortened time from sleep onset to the first REM period and a greater amount of REM activity. The changes in sleep characteristics are reversed by ECT (Kupfer et al., 1980, 1981).

One author has suggested that total seizure time may be an analog of the plasma level of antidepressant drugs, to provide a "therapeutic window" for a course of ECT (Maletzky, 1978). He noted that total seizure durations less than 210 seconds are much less effective than courses where the total seizure time was between 210 and 750 seconds.

Biochemical Measures

The biochemical effects of repeated seizures have been studied extensively and the reviews find consistent changes in brain tissues, CSF, blood, and urine (Essman, 1973; Fink, Kety, McGaugh, & Williams, 1974; APA, 1978; Fink, 1979). But the changes have not been related to clinical course, and none is useful as a predictor of clinical outcome. In studies of antidepressant medication, levels of urinary MHPG have been suggested as useful indices in the selection of different tricyclic antidepressants, but a study of its prognostic value in ECT did not confirm a relationship (Steiner et al., 1979). Studies of urinary cyclic AMP showed an increase with treatment (Hamadah et al., 1972; Moyes, 1972), while Choi, Taylor, and Abrams (1977) reported levels of calcium ATPase levels to be low in depression and to increase with treatment. In none of these studies is the relation to outcome defined.

An interesting relationship to outcome may be inferred from studies of calcium metabolism. A number of studies report decreased urinary, plasma, and CSF levels of calcium during a course of ECT, at a time when clinical improvement is noted, suggesting that the transfer of calcium into brain tissues is a feature of the therapeutic process (Flach, 1964; Faragalla & Flach, 1970; Carman & Wyatt, 1977). These observations suggest that monitoring plasma or urinary calcium may be a useful measure to relate to clinical outcome.

Neuroendocrine Measures

Recent studies of neuroendocrine relations in depressive illnesses provide the most interesting of the laboratory predictors. In some forms of depression, predominantly in endogenous depression or melancholia, neuroendocrine abnormalities are present in the absence of defined endocrinologic disease. The most extensively studied functions are those of the hypothalamic-pituitary-adrenal (HPA) axis (Carroll et al., 1976a,b), and the hypothalamic-pituitary-thyroid (HPT) axis (Loosen & Prange, 1980). An overactivity of the HPA axis is reflected in elevated plasma cortisol, loss of its diurnal rhythmicity, and its resistance to suppression (or early escape from suppression) by oral dexamethasone. This last abnormality has been reported in up to 50% of patients with melancholia, and is now seen as having diagnostic significance (Carroll et al., 1981). Hypoactivity of the HPT axis, as reflected in a blunted release of thyroid stimulating hormone (TSH) in response to intravenous thyrotropin releasing hormone (TRH), is also found in about 25% of patients with melancholia (Kirkegaard, 1981).

Normalization of the dexamethasone suppression test (DST) with clinical recovery is well documented (Greden & Carroll, 1979; Brown, Johnston, & Mayfield, 1979; Gold et al., 1980b; Greden et al., 1980; Papakostas et al., 1981). The DST and TSH tests in 50 hospitalized male veteran psychiatric patients with various psychiatric diagnoses were examined (Papakostas et al., 1981). Of 20 cases of unipolar melancholia, 17 exhibited hypercortisolism, and 14 failed to suppress plasma cortisol after dexamethasone. The measures were repeated in 14 unipolar depressed patients after a course of ECT. Improvement in psychopathology was directly related to normalization of the HPA functions. In the followup period at 9 months, the patients with normal HPA functions had better long-term prognoses than those with abnormal functions at the end of a course of ECT. It was concluded that normalization of HPA dysfunction could be used as an index of the end of a course of ECT, suggesting that clinicians should consider further treatment in those patients who continue to exhibit hypercortisolism or an abnormal DST after a series of ECT. Similar findings have been reported by others (Dysken et al., 1979; Albala & Greden, 1980; Greden et al., 1980; Albala et al., 1981). Similar neuroendocrine abnormalities and their response to ECT have been reported in patients with catatonia, suggesting that the tests are related to abnormalities in pathophysiology responsive to ECT, and not to a specific type of psychopathology (Brown, Johnston, & Mayfield, 1979; Dysken et al., 1979; Greden & Carroll, 1979).

Findings with the TRH test did not relate to psychopathology, nor did they change with ECT. The data are inconclusive, as the samples are small. Others found the TRH test to show similar changes with treatment for endogenous depression, and further study is needed (Mendlewicz et al., 1979; Kirkegaard & Bjørum, 1980; Asnis et al., 1980; Gold et al., 1980a; Loosen, & Prange, 1980; Kirkegaard, 1981).

Other indices of abnormal neuroendocrine response in patients with depression have been described (Fink, 1980). The release of growth hormone by hypoglycemia, L-dopa, and TSH is either reduced or lacking, and returns to normal with treatment. The prolactin response to carbidopa (Garfinkel et al., 1979), the corticosteroid response to methylamphetamine (Checkley, 1978, 1980), and the growth hormone response to amphetamine (Matussek, 1978) and to clonidine (Laakmann & Benkert, 1978; Matussek et al., 1980) characterize patients with severe depression. These studies, like those of the pituitary-thyroid axis, require additional work before their usefulness as prognostic indices can be fully assessed.

Conclusion

Many measures have been examined in the continuing search for a simple, specific, and safe laboratory test which may be used to identify patients for whom convulsive therapy may be helpful. There has also been some interest in using changes in some measures as endpoints to a therapeutic series. The degree of EEG slowing in the interseizure EEG, either at rest or after a challenge dose of a sedative drug; the onset of the first REM period in sleep; plasma and urine calcium levels; and neuroendocrine measures, particularly measures of plasma cortisol and some variation of steroid suppression tests, are of special interest in continuing studies. The TSH response to TRH, as a representative of other neuroendocrine systems, and the total seizure time are also of interest. The most compelling observation is the possibility that the DST, in those patients in whom it is abnormal before ECT, may be an index to the termination of a course of successful therapy.

Relevance of Neuroendocrine Strategies Electroconvulsive Therapy Research

Roger F. Haskett, M.B.B.S.[1], and A. Ariav Albala, M.D.[1]

Introduction

Neuroendocrine strategies are a relatively recent addition to clinical psychiatry. The techniques developed from the observation that endocrine function was often altered in association with abnormal mental states. The theoretical rationale for the use of peripheral hormone measurements as biological markers of psychiatric illness was provided by the identification of functional links between the hypothalamus and anterior pituitary gland. These connections provided the mechanism whereby the limbic system dysfunction associated with psychiatric illness could directly interfere with neuroendocrine regulation. Like the clinical endocrinologists who developed these strategies, psychiatrists have found that measurement of basal hormone levels alone will not generally provide very specific information. Abnormalities of neuroendocrine regulation appear to be more precisely identified by dynamic studies of endocrine function such as stimulation or suppression tests.

A number of studies have demonstrated consistent abnormalities of the hypothalamic-pituitary-adrenal (HPA) and hypothalamic-pituitary-thyroid (HPT) axes in patients with melancholia. Evidence is accumulating that two neuroendocrine strategies, the Dexamethasone Suppression Test (DST) and the Thyrotropin-Releasing Hormone Stimulation Test (TRH Test), which examine the function of the HPA and HPT axes, respectively, have clinical utility in the study and management of melancholia.

---

[1] Department of Psychiatry, University of Michigan, Ann Arbor, MI 48109.

The Desamethasone Suppression Test (DST)

This strategy evolved from a procedure described by Liddle (1960) for the evaluation of HPA axis dysfunction in Cushing's disease. When normal subjects receive a dose of 1 or 2 mg dexamethasone at midnight, plasma cortisol levels are suppressed for at least the next 24 hours. During the 1960s, several investigators reported that, in addition to secreting excessive amounts of corticosteroids, the HPA axis in some patients with melancholia is abnormally resistant to suppression by dexamethasone. Subsequent studies have confirmed this finding and developed the DST procedure to give optimal test results for the diagnosis of melancholia (Carroll, et al. 1981). Cortisol levels are measured at 4 p.m. and 11 p.m. after administration of 1 mg dexamethasone at 11:30 p.m. on the previous day. This form of the DST identified the syndrome of melancholia with a sensitivity of 67% and specificity of 96% when administered to psychiatric inpatients.

The Thyrotropin-Releasing Hormone Stimulation Test (TRH Test)

The TRH Test used in psychiatric studies is identical to the one devised by endocrinologists for the study of HPT disorders. The test is usually conducted at mid-morning, when spontaneous plasma TSH level fluctuations are least, after an overnight fast. After drawing one or two baseline blood samples, TRH is administered intravenously over a 30-second period. Subsequent samples are obtained 15, 30, 60, and 90 minutes after TRH administration. Most of the studies have used TRH doses of either 200 or 500 µg. TSH concentrations are determined by radioimmunoassay (RIA), and the maximal change in TSH (Δ TSH) is obtained by subtracting the baseline TSH value from the maximum TSH level after TRH administration.

Since the first reports showed that a proportion of depressed patients have blunted TSH responses to TRH (Kastin, Ehrensing, Schalch, & Anderson, 1972; Prange, Wilson, Lara, Alltop, & Breese, 1972), many investigators have replicated and extended those findings. Review of these studies reveals that between 25 and 30% of euthyroid depressed patients have blunted responses to TRH, regardless of whether a dose of 200 µg or 500 µg of TRH is used in the test. With so insensitive a test, the diagnostic utility of the test is probably low. Despite this limitation, there is some evidence that treatment-associated changes in the TRH Test may serve as predictors of outcome of the acute episode.

Questions For ECT Research

Since the syndrome of melancholia is the most widely accepted clinical indication for ECT, the information obtained from melancholic patients using these two strategies and their relevance to ECT research should be examined. Although similar techniques are likely to be helpful in defining the therapeutic mechanism of ECT, there have been few human studies on this subject. This discussion will be confined to the relevance of the DST and the TRH Test to the study of ECT in clinical practice.

The information provided by these neuroendocrine strategies may be used to examine three important questions. How can ECT-responsive patients be identified and, in particular, for which patients is ECT the *most* effective form of treatment? Can the therapeutic action of ECT be monitored by changes in biological markers and will these markers indicate the optimal endpoint for a course of ECT? Is it possible to predict which patients require continuation therapy to prevent relapse after a successful course of ECT?

Selection Of ECT-Responsive Patients

In addition to being a diagnostic aid in patients with melancholia, there are several reports which indicate that the presence of an abnormal DST may be useful as a predictor of response to treatment. Some studies suggest that patients with melancholia and an abnormal DST result have a better response to antidepressant treatment than similar patients with a normal DST result (Brown & Shuey, 1980; Greden et al. 1981). Another study reported that the DST result was more effective than clinician's judgment in predicting response of depressed catatonics to thymoleptics (Carman, Hall, Wyatt, & Crews, 1980).

It remains unclear whether the DST can identify particular melancholic patients who will respond better to ECT than antidepressant medication. There are two subgroups of patients with melancholia who generally have an excellent response to ECT and are more likely to be unresponsive to antidepressant medications. These are depressed patients with a catatonic syndrome and patients with an affective psyhcosis. Melancholic patients with psychosis may have a higher frequency of abnormal DST results than is generally present in melancholia (Carroll et al. 1980; Rudorfer, Hwu, & Clayton, 1982). In addition, retrospective examination of DST results in patients referred for ECT by clinical criteria alone shows a very high frequency of abnormal DST results (Papakostas, Fink, Lee, Irwin, & Johnson, 1981; Albala, unpublished data). These observations cannot demonstrate a relationship between an abnormal DST result in melancholia and good response to ECT. This possible association requires examination in a prospective study which controls for the psychotic and catatonic subtypes of melancholia, and compares the pretreatment DST result with the relative efficacy of antidepressant medication and ECT.

There have been no prospective studies to suggest that the TRH Test can be used to predict response to ECT. If the data reported by Papakostas, et al., (1981) are re-examined using the Δ TSH criterion of less than 7 μU/ml as suggested by Gold, Pottash, Extein, Martin, Howard, Mueller, and Sweeney (1981), it is evident that six out of seven patients with an abnormal TRH Test responded to ECT, whereas only one out of four patients with a normal TRH Test showed a good response. These data suggest that the relationship of the TRH test to prediction of ECT response deserves further examination.

Determination of Endpoint for a Course of ECT

One of the important problems faced by the clinician using ECT is to determine when a course is complete. In an attempt to lessen memory impairment, it is advisable to give the least number of ECT treatments necessary to induce relief of symptoms and prevent an early relapse. However, as discussed separately (*see* Haskett, pp. 75-78) no reliable criterion exists for determining the optimal number of ECT necessary to treat a specific patient. There are indications that the DST can provide some information on this subject.

Several investigators reported the results of serial DSTs performed throughout a course of ECT. Dysken, Pandey, Chang, Hicks, and Davis (1979) reported a case of a 56-year-old man with a diagnosis of major depressive disorder, psychotic and endogenous subtype, who was treated with ECT and had weekly DSTs throughout his treatment. They found that the abnormal DST results observed prior to treatment steadily normalized in association with clinical recovery. In another case report, Albala, Greden, and Carroll (1980) performed weekly DST assessments on a 69-year-old woman who was being treated with ECT. The abnormal pretreatment DST results normalized after the third ECT even though her depressive symptoms remained quite prominent. Further treatment resulted in good clinical recovery. More recently, Rothschild and Schatzberg (1982) reported the case of a 39-year-old man with a psychotic depression in whom the DST was performed serially during two courses of ECT. Each time, the DST normalized prior to complete, yet short-lived, clinical recovery.

Albala, Greden, Tarika, and Carroll (1981) selected a group of six unipolar endogenous depressives with abnormal DST results prior to treatment and who were treated with ECT. The DST was repeated every 5 to 7 days throughout treatment. Five out of the six patients responded favorably to ECT. The DST result in all responders normalized early in treatment despite only modest clinical improvement. Further ECT resulted in complete clinical recovery and a persistence of normal DST results. The single patient in whom DST normalization was not observed failed to respond to treatment. Similar results were reported by Schlesser and Rush (1981) who studied 12 endogenous depressives with abnormal DST results. They found that at mid-treatment six of the eventual 10 responders had normal DST results, and by the end of treatment the DST was normal in all 10 responders. In contrast, the two patients who did not respond to ECT continued to show abnormal DST results.

These findings seem to indicate that during the ECT-induced clinical improvement, the post-dexamethasone cortisol levels decrease and eventually normalize. This pattern is only observed among ECT responders and does not occur in patients who have a poor outcome to the treatment. This suggests that the DST can be used as a biological monitor of clinical response to ECT. Another aspect of these studies is the timing of the DST normalization in relation to clinical improvement. DST normalization precedes complete clinical recovery and accurately identifies the eventual ECT responders. This finding has important implications for the clinician who may be inclined to stop a course of ECT because of no apparent response. The presence of a normalized DST may indicate that extra treatments will eventually result in good clinical recovery.

Theoretically, serial TRH Tests may also yield information which is potentially useful in the clinical management of patients receiving ECT. This would particularly apply to those depressed patients who have a normal DST result and an abnormal TRH Test result. The existence of such a patient population has been demonstrated by Extein, Pottash, and Gold (1981) who conducted both DSTs and TRH Tests on patients diagnosed as major depressive disorder, primary subtype. They found that 34% of these patients had an abnormal TSH response to TRH in the presence of a normal DST result. Serial TRH Tests have been done in a group of 21 unipolar patients treated with clomipramine (Langer, Schönbeck, Koinig, Lesch, Schüssler, & Waldhäusl, 1980). The data suggested a significant statistical correlation between clinical improvement and increased TSH response to TRH. A similarly designed study with ECT-treated patients has not been reported and is necessary to evaluate the potential use of the TRH Test as a monitor of clinical response to ECT.

Prediction of Relapse After ECT

The incidence of relapse after successful treatment of ECT is reported to be very high. This is discussed in more detail elsewhere (*see* Haskett, page). It would be extremely valuable if tests could identify those patients who are more likely to experience an early relapse. This would permit a clinician to prescribe continuation therapy for those patients who require prophylaxis after completion of a course of ECT. Several studies suggested that lack of DST normalization may predict early relapse despite apparent clinical remission of the depression (Greden, Albala, Haskett, James, Goodman, Steiner, & Carroll, 1980; Goldberg, 1980; Gold, Pottash, Extein, & Sweeney, 1980; Papakostas et al., 1981).

In two of these studies specific data regarding ECT-treated patients are available. Greden et al. (1980) reported 14 patients with abnormal pretreatment DST results. Four of these patients were treated with ECT and all responded to treatment. Three responders had a normal DST after ECT and remained asymptomatic for at least 7 months. One patient clinically improved after the course of ECT, but did not show normalization of the neuroendocrine disturbance. She was admitted 6 weeks later for treatment of a relapse with a second ECT course which resulted in both clinical recovery and DST normalization. She subsequently remained asymptomatic for at least 1 year. Papakostas et al. (1981) presented a series of 14 unipolar depressed patients who were treated with ECT. Nine patients eventually responded to treatment and eight of these had pretreatment post-dexamethasone cortisol levels in excess of 5 μg/dl. At discharge, the DST result had normalized and all had a good outcome for 1 to 9 months. The three patients who responded clinically but still displayed abnormal DSTs had a poor outcome. Two were readmitted within 2 months and the third committed suicide 4 weeks after discharge.

These data suggest that persistently abnormal DST results after a course of ECT predict a poor outcome and a high risk for relapse, even where clinical recovery appears adequate. Conversely, clinical recovery accompanied by DST normalization may be a predictor of good outcome. An exception to this appears in a case report by Rothschild and Schatzberg (1982). Their patient was successfully treated with ECT, and normalization of the DST occurred. The patient, however, quickly relapsed and the DST again became abnormal. A second ECT course produced good clinical response and DST normalization. Still a second relapse occurred in association with an abnormal DST. Remission and DST normalization were eventually accomplished and maintained with the use of amoxapine. In this case DST normalization failed to predict a good outcome and was associated with rapid relapse. An alternative explanation is that this patient may have been a "rapid cycler" (Dunner, Patrick, & Fieve, 1977), and every relapse could have represented a new episode rather than a reemergence of the original episode. Greden, DeVigne, Albala, Tarika, Buttenheim, Eiser, and Carroll (1980) have shown that DST results can rapidly change in association with mood shifts in rapid cycling bipolar patients.

Several studies have reported on repeat TRH Tests after clinical recovery (Kirkegaard, 1981). It is apparent that some patients do not show a normalized TRH Test result despite clinical recovery. This suggests that, as mentioned in the previous section on the DST, antidepressant treatment can have a symptomatic effect in some patients without altering the neuroendocrine disturbance. Kirkegaard (1981) has reported that the persistence of abnormal TRH Test responses after clinical recovery predicts early relapse. In their study of 66 "clinically cured" patients, antidepressant therapy was withdrawn after clinical recovery and the patients were followed for at least 6 months or until relapse. They showed that $\Delta\Delta$ TSH values (Δ TSH at discharge - Δ TSH on admission) clearly distinguished good prognosis from poor prognosis patients. The $\Delta\Delta$ TSH criterion value of 2.0 μU/ml predicted cure in 27 out of 29 patients and relapse in 33 out of 37 patients. Most of the patients with little treatment-associated improvement in their neuroendocrine disturbance ($\Delta\Delta$TSH $< 2\mu$U/ml) relapsed within 4 months. In contrast, the patients with $\Delta\Delta$ TSHs > 2.0 μU/ml had a good outcome during the first 6 months after discontinuation of antidepressant treatment. This group of patients includes a subset of 35 patients with endogenous depression who were treated with ECT. All 19 patients with $\Delta\Delta$ TSH ≤ 2.0 μU/ml relapsed within 6 months of completing the ECT course. By comparison, only 3 out of 16 patients with $\Delta\Delta$ TSH > 2.0 μU/ml suffered a relapse. The relapse rates were similar among unipolars and bipolars (Kirkegaard & Bjorum, 1980). These results strongly suggest that normalization of the TRH Test, as defined by Kirkegaard, can be a reliable indicator of cure and therefore identify those patients who require maintenance antidepressant therapy to prevent relapse. A replication of this study is required.

In the series of patients presented by Papakostas et al. (1981), three of the nine ECT responders had blunted TRH Test results ($\leq$ 5.0 μU/ml) prior to treatment. In two of these cases the TRH Test was repeated and remained blunted (one with a $\Delta\Delta$TSH < 2.0 μU/ml and the other with a $\Delta\Delta$ TSH > 2.0 μU/ml). Neither relapsed during a 9-month followup period. The third patient with a blunted response on admission committed suicide 1 month after discharge. No repeat TRH Test was available in this case. The number of patients in this study is too small to draw any conclusions on the prognostic value of the TRH Test.

Conclusion

This review of neuroendocrine studies has been unable to provide definitive answers to the previously stated questions for ECT research. There is, however, much evidence that this area of investigation is likely to be helpful in the future. It is unlikely that a single neuroendocrine test will be able to select those patients requiring ECT in preference to other antidepressant treatment. Combination of neuroendocrine testing with other laboratory markers, or clinical subgrouping of syndromes, may however be successful in providing objective indications for ECT. The relationship of the normalization of neuroendocrine function to the therapeutic mechanism of ECT requires further examination. It may be possible to use these markers to more precisely determine the "adequate dosage" of treatment for individuals receiving ECT. Finally, it appears that changes in neuroendocrine tests during ECT may be of great assistance in the identification of patients with a high likelihood of relapse. There is a need for prospective studies to clarify these questions. The clinician using ECT may then be able to use objective criteria to support decisions on patient selection, duration of ECT course, and the need for continuation treatment.

Hemispheric Asymmetry in Affective Disorders

Henry A. Nasrallah, M.D.[1]

Introduction

Over the past 30 years, significant advances have been made in the understanding of the cerebral hemispheric and interhemispheric functions in the human brain. In contrast to previous notions that the two cerebral hemispheres were duplicate structures with one dominant/major (usually the left) and another nondominant/minor (usually the right) hemisphere, research over the

past three decades has established that the two cerebral hemispheres are structurally and functionally asymmetrical, and that both have to be fully integrated to produce optimal mental activity.

The quantum leap in the understanding of hemispheric asymmetry was the product of the pioneering work of Sperry and others into the split brain of animals (Myers & Sperry, 1953; Sperry, Stamm, & Miner, 1956; Sperry, 1961) and humans (Gazzaniga, 1970) showing that the surgically separated hemispheres contain two independent spheres of consciousness, with different motor, perceptual, cognitive, conative, and emotive functions. The separated cerebral hemispheres can be trained to concurrently perform contradictory tasks, and cerebral dominance for a certain task (i.e., laterality) can be experimentally shifted from one hemisphere to the other. In the human brain, the left hemisphere is usually more specialized for verbal, analytical, logical, and propositional tasks while the right hemisphere is more specialized for spatial, synthetic, intuitive, and oppositional tasks. The monumental studies of split-brain patients have indeed revolutionized the scientific and philosophical conceptualization of brain, mind, and the unity of conscious awareness (Sperry, 1968; Puccetti, 1973; Sperry, 1977; LeDoux, Wilson, & Gazzaniga, 1977).

Inevitably, the new knowledge of the cerebral hemispheric asymmetry of function triggered novel areas of psychiatric research which over the past decade has created an impressive body of evidence linking psychopathology with normal and abnormal cerebral lateralization (Gruzelier & Flor-Henry, 1979). Laterality shifts have been found in psychosis (Wexler & Heninger, 1979) and have been shown to be related to many factors frequently associated with psychiatric illness such as stress (Tucker, Roth, Arneson, & Buckingham, 1977), alcohol ingestion (Chandler & Parsons, 1977), sleep (Goldstein, Stoltzfus, & Gardocki, 1972), hypnosis (Frumkin, Ripley, & Cox, 1978), orgasm (Cohen, Rosen, & Goldstein, 1976), psychotomimetic drugs (Goldstein & Stoltzfus, 1973), and neuroleptics (Serafetinides, 1972).

Most of the research into hemispheric asymmetries in psychiatric illness has focused on the major psychoses such as schizophrenia and affective disorders. The literature has tended to suggest that schizophrenia is associated with left hemispheric as well as interhemispheric dysfunction (Newlin, Carpenter, & Golden, 1981; Nasrallah, in press). In this paper, a selective review of the literature on cerebral laterality in affective disorders will be presented, with a special reference to implications for electroconvulsive therapy (ECT) research.

Hemispheric Asymmetries in Affective Disorders

Unilateral brain lesions: The clinical presentations of patients with neurological lesions in the right or left cerebral hemisphere provided the first clue of hemispheric asymmetry for affect. Babinski (1914) noted that patients with right hemispheric lesions behaved indifferently to the contralateral sensory-motor deficits. Goldstein (1939) noted that left hemispheric lesions were associated with a catastrophic reaction, whereas right hemispheric lesions were associated with indifference. Gainotti (1972) observed that the emotional and psychiatric symptoms accompanying a brain lesion depend on the side of the lesion.

Nasrallah and McChesney (1981) reported that tumors of the corpus callosum were significantly more likely to manifest clinical signs and symptoms of depression than tumors in either cerebral hemispheres. They suggested that interruption of interhemispheric interaction may be associated with affective symptoms.

Temporal lobe epilepsy: In a study of psychoses associated with temporal lobe epilepsy, Flor-Henry (1969) stated that left temporal lobe foci are more likely to be associated with a schizophrenia-like psychosis, while the right hemispheric foci are more likely to be associated with affective psychosis. Bear and Fedio (1977) reported that patients with right temporal lobe epilepsy had emotional tendencies and denied depression even when they appeared to have it, while patients with left temporal lobe foci had ideational traits and dyssocial behavior, and reported more depression even when they did not have it. They suggested that their findings indicate a hemispheric asymmetry for the expression of affect.

Intracarotid amytal effects: Terzian and Cecotto (1959) reported a differential response of the two cerebral hemispheres to intracarotid sodium amytal injections with "depressive-catastrophic" reaction following the inactivation of the right hemisphere. These findings were replicated (Rossi & Rosadini, 1967), except in patients with diffuse brain damage (Alema, Rosadini, & Rossi, 1961), and not replicated by Milner (1967).

Hommes and Panhuysen (1971) gave unilateral intracarotid amytal to patients hospitalized for depression, and found that more dysphasia occurred with right carotid amytal, and the severity of depression correlated negatively with dominance for speech in the left hemisphere, suggesting that left hemispheric dominance is reduced in depression. Elevation of mood was noted with injections on either side to varying extents, but depressive reactions were difficult to ascertain against the background of preexisting clinical depression.

ECT and laterality: A large literature appeared during the past 15 years suggesting that ECT applied only to the right hemisphere is as effective as bilateral ECT for the treatment of depression, but that ECT to the left hemisphere only was significantly less effective than bilateral or right hemispheric ECT (Halliday, Davison, Brown, & Kreeger, 1968; Abrams & DeVito, 1969; Cronin, Bodley, Potts, Matgher, Gardner, & Tobin, 1970; Costello, Belton, Abra, & Dunn, 1970) which has led to suggestions that depression may be associated with right hemispheric dysfunction. Deglin and Nikolaenko (1975) found more dysphoric reactions following left ECT and more euphoric reactions following right ECT and concluded that the left hemisphere plays a major role in the regulation of mood.

Kronfol, Hamsher, Digre, and Waziri (1978) reported that before treatment with ECT, depressed patients had more abnormalities in neuropsychological testing of right hemisphere functions compared to the left, and that after ECT (whether unilateral right or left) the right but not the left hemispheric functions were improved.

Nasrallah, McCalley-Whitters, and Keelor (submitted for publication) tested depressed patients for sensory and motoric lateralization before and after ECT to examine the effect of ECT on hemispheric dominance. All patients experienced shifts in either sensory or motor lateralization, but with equal frequency towards left and right hemispheric dominance.

EEG asymmetry: Using power spectrum EEG, Flor-Henry (1976) showed that schizophrenia is associated with left temporal EEG abnormalities, while affective illness is associated with right temporal abnormalities. Urstad (1979) found higher alpha activity on the left compared to the right temporal region in a group of schizophrenic and depressed patients, while the control group had a reverse pattern. After treatment, the depressed patients showed normal alpha predominance over the right hemisphere.

Abrams and Taylor (1979) examined 132 rigorously diagnosed patients with affective disorder and compared them to 27 schizophrenic patients. They found that the schizophrenic patients had a higher rate of abnormal EEG, particularly temporal slowing, whereas the affective group had more parieto-occipital abnormalities. They also noted that EEG abnormalities were lateralized, with predominantly left hemispheric abnormalities in schizophrenia and predominantly right hemispheric abnormalities in the affective group.

Skin conductance: Brain damage has been found to be associated with decreased skin conductance on the side ipsilateral to the lesion (Sourek, 1965). Gruzelier and Venables (1974) found decreased skin conductance on the right side in depressed patients and concluded that there is right hemispheric dysfunction in depression. Myslobodsky and Horesh (1978) reached the same conclusion, but with the findings of high conductance on the left side in depressed patients, which they interpret as evidence of contralateral brain dysfunction in the right hemisphere.

Dichotic listening: Dichotic listening has been shown to be a reliable method of indicating which cerebral hemisphere is dominant for language functions (Kimura, 1967). Yozawitz, Bruder, Sutton, et al. (1979), using verbal and nonverbal auditory stimuli, found that ear asymmetry of affectively ill patients was similar to patients with right temporal lobe lesions. They also found that neuroleptics worsen this asymmetry in affective patients but normalize it in schizophrenic patients.

Wexler and Heninger (1979) reported that the normal dichotic asymmetry diminished in both schizophrenic and depressed patients when the psychopathology was high and was restored when patients improved. They concluded that psychotic illness is associated with a shift in laterality from left to right.

Bruder and Yozawitz (1979) also found that dichotic asymmetry in depression is consistent with right hemispheric dysfunction. Caudry and Kirk (1979) found schizophrenic patients to have a right ear advantage, while depressed patients have a left ear advantage. They concluded that depressives have a higher tendency for speech to be located in the right hemisphere.

Lateral eye movements: Conjugate lateral eye movements have been hypothesized to reflect activation of the cerebral hemisphere contralateral to the direction of gaze (Bakan, 1971). Verbal tasks have been shown to activate the left cerebral hemisphere, and spatial and emotional tasks preferentially activate the right cerebral hemisphere (Kinsbourne, 1972; Schwartz, Davidson, & Maer, 1975).

Schweitzer (1979) reported that depressed patients initiated reflective tasks more often in the right hemisphere. Myslobodsky and Horesh (1978) found depressed patients to look more often to the left for various tasks, and concluded that there may be right hemispheric overactivity in depression.

Motoric lateralization: Handedness is a crude measure of cerebral dominance for motoric laterality, with right handedness indicating left hemisphere dominance, and left handedness or ambidexterity reflecting right hemisphere dominance, in some cases due to early brain insult and left cerebral impairment (Satz, 1972).

Left handedness has been reported to be high in schizophrenia (Dvirskii, 1976; Gur, 1977; Nasrallah, Schroeder, Keelor, & McCalley-Whitters, 1981), particularly the paranoid subtype (Nasrallah, Kuperman, McCalley-Whitters, & Keelor, 1981). An increased frequency of left handedness in affective disorders has been reported by some investigators (Lishman & McMeekan, 1976; Flor-Henry, 1979) but not by others (Fleminger, Dalton, & Standage, 1977; Nasrallah & McCalley-Whitters, in press).

Neuroanatomical measurements: Rosenthal and Bigelow (1972) reported an increase in the thickness of the corpus callosum (the largest interhemispheric commissure) in postmortem brains of chronic schizophrenic patients. This has been widely interpreted as possible evidence for interhemispheric dysfunction in schizophrenia.

In the only other study of corpus callosum thickness in schizophrenia (Nasrallah, Bigelow, Rauscher, & Wyatt, 1979), brains of patients with bipolar affective disorder were also studied. The mean corpus callosum thickness in the affective group was almost identical to that of the late onset (paranoid) schizophrenic group, but almost significantly less ($p < .08$) than the early onset (nonparanoid) schizophrenic group. Histological studies of the corpus callosum in affective disorders are also similar to the late onset schizophrenic group (Nasrallah, McCalley-Whitters, Bigelow, & Rauscher, 1982).

Positron emission tomography (PET): Very recent studies of brain glucose metabolism using PET scans suggest that in contrast to the hypofrontal pattern seen in schizophrenic patients, patients with bipolar disorder have a hyperfrontal pattern during the manic phase. Asymmetry was also noted in schizophrenic patients (more metabolism in the right hemisphere) but data are not yet available on affectively ill patients (Farkas, 1980).

Discussion

The above review reflects the various lines of evidence for hemispheric asymmetry in affective illness. Although some form of right hemispheric dysfunction is the leading model for understanding hemispheric asymmetry of function in affective disorders, more evidence is needed to confirm that hypothesis and the specific nature of the hemispheric dysfunction in affective illness has to be defined. Many of the studies in this area of research suffer from methodological flaws that limit the reliability and validity of the results. Perhaps the greatest source of error is diagnostic accuracy, particularly in light of the heterogeneity of affective disorders, and the overlap with the schizophrenias. Almost all the studies of laterality did not use accepted diagnostic criteria such as the Diagnostic and Statistical Manual-III (DSM-III). The measurement of laterality is another area that requires further reliability and validity research (Colbourn, 1979).

The critical research issue in the area of hemisphere asymmetry of function in affective illness is therefore the establishment of whether one of the cerebral hemispheres is differentially involved in affective illness and, if so, how. The proper strategy for answering this question should involve multiple measures of laterality in rigorously defined drug-free populations of affectively ill patients diagnosed by specific and reliable criteria.

ECT research can provide an excellent avenue for the study of hemispheric asymmetries in affective illness. ECT is an effective somatic treatment which is more easily quantifiable compared to pharmacological treatments. It also offers the distinct advantage and flexibility of being administered to either cerebral hemisphere or to both, whereas drugs are given systemically and therefore cannot be targeted to one part of the brain only. Thus, ECT offers a unique therapeutic and research strategy for the investigation of hemispheric dysfunction in affective illness. Patients could be assessed prior to treatment for both psychopathology and neuropsychological deficit as well as for measures of laterality such as EEG, dichotic listening, tachistoscopy, skin conductance and motoric preference. Repeat evaluation after unilateral ECT treatment to one hemisphere would then provide valuable data as to any dysfunction in either hemisphere, and to the concomitant laterality changes (if any) with therapeutic response.

The Relative Efficacy of Unilateral Nondominant and Bilateral Stimulation

Charles A. Welch, M.D.[1]

Unilateral nondominant electrode placement offers a marked reduction in adverse cognitive effects when compared to bilateral placement. In spite of this clear finding, bilateral placement remains the standard technique in the United States, and the 1976 APA Task Force on electroconvulsive therapy (ECT) found that 75% of survey respondents used bilateral electrode placement exclusively, presumably in the belief that it is more effective than the unilateral technique. The same is true in the United Kingdom. Over 35 different studies have compared the efficacy of unilateral and bilateral placement, but the results have been contradictory. Most investigators find equal efficacy for the two methods, and a few studies show one or the other to be superior. This disparity in findings has persisted to the present in spite of increasingly rigorous research designs. Because of the reduced morbidity associated with unilateral nondominant placement, it remains a pressing research priority to ascertain whether unilateral nondominant and bilateral placement are equally effective.

In a major review of this literature, d'Elia and Raotma (1975) examined 29 studies of this question published from 1962 to 1973. They divided the studies into five groups according to methodological criteria (random assignment, blind comparison, simultaneous controls, homogenous diagnostic groups, and open number of ECT treatments). They observed that the more rigorous the methodology, the more equivalent the efficacy of unilateral nondominant and bilateral ECT appear to be, and that of the five followup studies from 1 to 12 months, all found equal efficacy. They concluded, "The review of studies performed under adequate methodological conditions shows that nondominant ECT has the same antidepressive effect as bilateral ECT. This is in agreement with our knowledge that the antidepressive factor of ECT is bound to the seizure. Nondominant ECT has the advantage of a much lower frequency and intensity of side effects. In endogenous depression nondominant ECT should be the treatment of choice."

They speculated that one reason for the frequent finding of less efficacy with unilateral nondominant treatment may have been more frequent missed seizures with this technique than with bilateral placement.

Since this review, there have been five published comparison studies, and there are two in press. They have yeilded differing results.

Abrams and Taylor (1976) compared bilateral and simultaneous unilateral dominant and unilateral nondominant stimulation. They used random assignment, and a blind rater assessed improvement with the Hamilton Depression Scale 5 hours after the sixth treatment. Sine-wave stimulation was used throughout and there was no seizure monitoring. Bilateral ECT was found to be significantly more effective than simultaneous unilateral dominant—unilateral nondominant. The authors concluded, "The therapeutic differences we observed between our two treatment methods might therefore be explained by the different degree of diencephalic stimulation, the degree of frontal lobe stimulation, or both."

Although scientifically very interesting, this study is not a direct comparison of unilateral nondominant and bilateral ECT, and does not specifically address the question at hand.

Reichert, Benjamin, Keegan, and Marjerrison (1976) compared bilateral and unilateral nondominant ECT in a study of 50 patients. They employed a sinusoidal wave form but no seizure monitoring, although they stated that "All patients exhibited full tonic-clonic seizures." Blind raters assessed patients with the 17-scale Brief Psychiatric Rating Scale (BPRS) prior to treatment and 1 and 3 weeks after the last ECT. In addition, patients completed the Hildreth Mood and Attitude Scale, a subjective rating instrument, prior to treatment and 1 day after the third, fourth, fifth, sixth, and last treatments, and at 1 and 3 weeks after the last treatment. An open number of ECT were given based on clinical judgment. The authors found that there was no significant difference between the two groups on the BPRS ratings at 1 or 3 weeks. However, the bilateral group was significantly more improved subjectively at all points in time except the final

---

[1] Somatic Therapies Consultation Service, Massachusetts General Hospital, Boston, MA 02114.

rating at 3 weeks posttreatment, at which time there was no difference between the groups. They also found a 26% 1-month relapse rate with the unilateral group but only a 3% 1-month relapse rate with the bilateral group.

Heshe, Roder, and Theilgaard (1978), in a study of 51 patients, used random assignment and double-blind design in a comparison of bilateral and unilateral nondominant ECT. A sine-wave stimulus was used without seizure monitoring. The Hamilton Depression Scale was given pre-ECT and then 1 week and 3 months after the last treatment. The bilateral group was found to be slightly but significantly more improved at 1 week after treatment, but the difference disappeared at 3 months followup.

Weeks, Freeman, and Kendell (1980) studied 102 patients, comparing bitemporal with unilateral nondominant ECT. Sine-wave stimulus was used but there was no seizure monitoring. The number of ECT was open with a mean of 7.4 in the unilateral group and 7.2 in the bilateral group. Assignment was nonrandom, but blind raters assessed efficacy with the Hamilton Depression Scale pre-ECT and then at 1 week, 4 months, and 7 months after the last ECT. There were no significant differences in the degree of improvement at any of the assessment points. The authors performed extensive cognitive testing which confirmed prior findings that unilateral nondominant ECT causes very little cognitive impairment even short term, and markedly less impairment than bilateral ECT.

Fraser and Glass (1980), in a study of 29 elderly depressed patients with a mean age of 73, compared bitemporal and unilateral nondominant ECT. A unidirectional chopped sine-wave stimulus was used without seizure monitoring. Patients were randomly assigned and blind raters assessed improvement with the Hamilton Depression Scale pre-ECT, 24 hours after the fifth treatment, and 3 weeks after the last treatment. The number of treatments was free with a mean of 6.1 in the unilateral groups and 6.9 in the bilateral groups. The mean pre-ECT Hamilton score was 46 for both cells. No significant differences were found on Hamilton Depression Scales at either of the post-ECT test intervals. Assessment of cognitive side effects showed no correlation between severity of side effects and outcome.

Abrams, Taylor, Faber, et al. (in press), in a randomly assigned, double-blind study of 51 patients, compared bitemporal and unilateral nondominant ECT. Stimulation was delivered by sine-wave apparatus, and seizures were monitored with an oscilloscope. Improvement was assessed by the Hamilton Depression Scale after the sixth treatment. The total number of treatments was free, with a mean of 6.3 in the bilateral group and 9.1 in the unilateral group. The bilateral group showed 81.1% improvement on the Hamilton Depression Scale after six ECTs, while the unilateral group showed only a 55.5% improvement ($p = .004$), a finding which was independent of age, sex, pretreatment severity of illness, or sedative drug administration. After 10 treatments, the primary clinician, who was a blind rater, was free to switch to the alternate electrode placement if the series was felt to be ineffective. Seven unilateral patients were switched to bilateral, while none of the bilateral group was switched to unilateral ($p = .008$). Finally, no patient in the bilateral group received more than nine ECTs, compared with 10 patients in the unilateral group ($p = .0007$).

Welch, Weiner, Weir, et al. (1982) randomly assigned 59 patients to one of four modalities: unilateral nondominant sine, unilateral nondominant brief pulse, bilateral sine, and bilateral brief pulse. Stimulation was delivered by either a bidirectional sine-wave apparatus or a bidirectional brief-pulse apparatus, both at threshold levels of current. Seizures were monitored with either EEG or occlusion of ipsilateral upper extremity circulation. Improvement was measured by the difference between blindly obtained Hamilton Depression Scale ratings pre-ECT and 48 hours after the last ECT. The total number of treatments given was determined by a nonblind clinician and was 8.1 for the unilateral group and 7.3 for the bilateral group, a nonsignificant difference. The mean reduction in Hamilton Depression Scale was 35.1 for the unilateral group and 25.1 for the bilateral group ($p = .03$). No significant effect of waveform, age, sex, or number of treatments could be found. The authors speculated that the bilateral group may have appeared more depressed at 48 hours after the last treatment because of greater side effects associated with that treatment, and that the treatments were in fact probably equally efficacious.

Conclusion

The disparity between the findings of various investigators is difficult to explain. The most likely source of the difference in results rests in the failure of most investigators to use fastidious seizure monitoring. It has been suggested by Ottosson (1960) and asserted by subsequent investigators that the grand mal seizure itself is the therapeutic component of the treatment, and that the method of induction appears unrelated to efficacy as long as a generalized grand mal seizure is elicited. It is also established that unilateral or incomplete seizures are ineffective (Ulett, Gleser, Caldwell, & Smith, 1954; Fink, Kahn, & Green, 1958; Chatrian & Petersen, 1960) perhaps because they fail to recruit diencephalic centers. However, such incomplete seizures occur more frequently with unilateral than with bilateral stimulation (Lancaster, Steinert, & Front, 1958; Halliday, Davison, Browne, & Kreeger, 1968). In the absence of seizure monitoring, these ineffective seizures cannot be reliably identified and may be the cause of the frequent feeling that unilateral stimulation is less effective.

Another source of bias may be the different patient populations involved in these trials. For instance, the most recent work by Abrams et al. (in press) was done in a mostly male veterans' hospital population, while the population studied by Welch et al. (in press) was a mixture of general hospital and veterans' hospital patients.

The only firm conclusion that can be drawn is that further research is indicated to resolve the question of relative efficacy of unilateral nondominant and bilateral electrode placement. At this point it would appear that the only way to resolve it would be a large multicenter, randomly assigned, double-blind comparison, which simultaneously controls for side effects. Both short- and long-term assessment of severity of depression would be indicated.

Most important, however, is the monitoring of the seizure. Seizure monitoring should be done simultaneously by occlusion of arterial flow in the ipsilateral arm, with a blood pressure cuff, but also by a two-lead electroencephalograph (EEG) monitor. The EEG provides an accurate measure of seizure length, but occasionally fails to distinguish between partial and complete seizures, which are identical in appearance on a two-lead tracing. The occlusion of ipsilateral circulation provides a reliable check against this error, since partial seizures do not generally produce convulsive activity in the ipsilateral arm.

Although the research design outlined above is time consuming and cumbersome, the well-documented morbidity associated with the use of bilateral ECT warrants such a fastidiously controlled study to ascertain whether it is indeed more effective than unilateral nondominant ECT and, if so, in which patients.

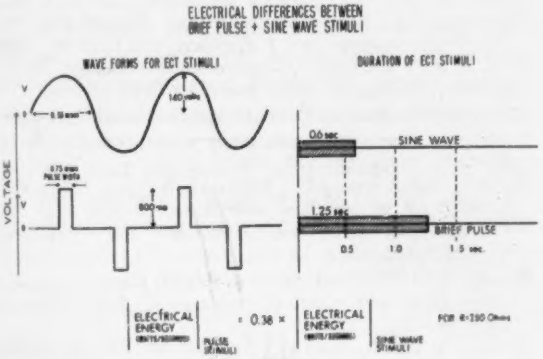
The Role of Stimulus Waveform in Therapeutic and Adverse Effects of ECT

Richard D. Weiner, M.D., Ph.D.[1]

Introduction

In electroconvulsive therapy (ECT), a seizure is produced by the application of a train of stereotypic electrical stimuli known as "waveforms." Although diverse types of stimulus waveforms have been used over the years, this brief review will consider just two, the sine wave and the pulse. These are the major waveform types utilized at the present time in the U.S.A., and they are representative of both ends of the waveform spectrum.

The sine wave stimulus (*see* Figure) is an oscillating pattern which is repeated 60 times a second (60 Hz). It is the same type of waveform which comes out of the wall socket, and for this reason not only was it the first stimulus waveform to be used with ECT, but also it is the one which remains the most popular stimulus waveform in the U.S.A. Adjustable parameters for the sine wave stimulus include voltage or current, and duration. The Figure shows typical initial parameter values for the use of the Medcraft B-24 (Hittman Corp.) sine wave ECT device (140 volts rms, 0.6 seconds' duration). For a patient resistance of 250 ohms, this stimulus will deliver 47 joules of electrical energy.



FIGURE

The pulse stimulus (*see* Figure) was first used with ECT in the early 1940s (Liberson, 1948), to produce seizures with a smaller amount of electrical energy, and thereby hopefully less adverse central nervous system (CNS) effects. The range of potential parameters with pulse ECT consists of voltage or current, duration, pulse width, and pulses per second (which reflects pulse spacing). The Figure shows typical initial parameter values for the MECTA (MECTA Corp.) pulse ECT device (800 ma current, 1.25 seconds' duration, 0.75 msec pulse width, and 60 pulse pairs per second). Again for a patient impedance of 250 ohms, this stimulus will deliver 18 joules of electrical energy, 38% of that described above for the sine wave stimulus. It should be noted that the energy per phase is considerably lower with the pulse stimulus, and that a longer stimulus duration is therefore generally necessary in order to provide the extent of neuronal depolarization necessary to initiate the seizure.

Therapeutic Correlates of Stimulus Waveform

The initial claims for the efficacy of pulse vs. sine wave ECT were that the two were equivalent (e.g., Liberson, 1948), although the research methodology was far from adequate. More recently, two prospective studies have demonstrated no significant therapeutic difference between sine wave and pulse stimuli (Weaver, Ives, Williams, & Nies, 1977; Welch, Weiner, Weir, Cahill, Rogers, Davidson, & Mandel, 1982). Others have suggested that the particular combination of pulse unilateral ECT may be less effective than other combinations (Lambourne & Gill, 1978; Price, 1981). Although such a phenomenon was not observed by either Weaver et al. (1977) or Welch et al. (1982), it remains possible that there may be a relatively small subgroup of patients who do not respond as well to unilateral ECT, whether given by pulse or by sine wave. At the same time, however, it should be made clear that the technique of unilateral ECT is considerably more difficult than with bilateral ECT, and that studies which have controlled for this have found little therapeutic difference between the two types of electrode placement (Weiner, 1980).

---

[1] Durham Veterans' Administration Medical Center and the Department of Psychiatry, Duke University Medical Center, Durham, NC 27710.

The role of pulse width in the diminishing of energy per phase has already been alluded to above. While shortening pulse width allows for more efficient seizure induction, it appears that ultrabrief pulses (pulse width less than 0.5 msec) may be associated with less complete, and thereby less effective, seizures (e.g., Cronholm & Ottosson, 1963).

The Effects of Stimulus Waveform Upon Adverse Effects

Early studies which compared pulse and sine wave stimuli with respect to adverse effects reported that, with the former, patients woke up earlier and demonstrated less confusion and amnesia (e.g., Liberson, 1948). Despite these claims, however, the methodology of these studies was inadequate in a number of ways, particularly in the use of concurrent differences in electrode placement between treatment groups, such that the observed advantage for pulse stimuli could actually have been due to the use of unilateral electrode placement.

More recently, Valentine, Keddie, and Dunne (1968) found less amnestic changes with pulse stimuli, but measurements were only made during the immediate postictal period and are therefore not applicable to interictal, and particularly to persistent, effects. Goldstein, Filskov, Weaver, and Ives (1977), using a comprehensive neuropsychological assessment battery, found no such difference 1 day following a course of ECT. Finally, Weiner, Rogers, Davidson, and Miller (1982), in a preliminary report, have described similar findings 2 days following a course of ECT, using sensitive measures of memory assessment, although a nonsignificant trend ($p \cong 0.08$) favoring the pulse stimulus was present. Electroencephalographically, the less intense seizures produced by pulse stimuli do, however, appear associated with less slowing 2 days after a course of ECT, based again on preliminary data (Weiner et al., 1982).

Summary and Recommendations for Future Research Investigations

In summary, the relative efficacy and safety of pulse stimuli with respect to sine wave stimuli is an issue deserving further study. While the two stimulus waveforms do appear to be roughly equivalent in terms of efficacy and memory effects, present studies have not been sufficient to delineate possible small differences, and there is some indication that waveform may have an effect upon acute electrophysiologic morbidity. Specific research questions for the future include:

1) Are there some patients who are more likely to respond to sine wave than to pulse stimuli, particularly in the case of unilateral electrode placement?
2) What are the specific roles of amplitude, pulse width, pulse separation, and stimulus duration in the production of effective seizures with pulse stimuli?
3) To what degree are adverse CNS effects less with pulse stimuli?

Answers to these questions will help to more adequately delineate the role of both types of stimuli in the clinical practice of ECT.

ECT and Tricyclic Antidepressants in the Treatment of Endogenous Depression

Richard Abrams, M.D.[1]

It is an axiom among psychopharmacologists that rigorous experimental methods are required to demonstrate the efficacy of a new drug or its advantages over an old one. A prospective design, random assignment to treatment groups, and blind assessment of outcome are prerequisites in such studies. Other requirements include specified diagnostic criteria, objective outcome measures, and appropriate statistical analysis of the outcome data. Nothing less can ever suffice to demonstrate the absolute or relative efficacy of any treatment, and electroconvulsive therapy (ECT) is no exception. Considering that ECT and tricyclic antidepressants (TCAs) have coexisted for almost a quarter-century, and that endogenous depression is the primary indication for each treatment, it would be reasonable to expect a substantial number of comparisons of the two methods in this target population, employing such rigorous methodology. Such is not the case. There are, in fact, very few data to support the oft-heard comment that ECT is superior to TCA in the treatment of endogenous depression. Only two studies satisfied the minimal design criteria specified above, and one of the studies is seriously flawed by inadequate sample size.

The first study is that of Wilson and associates (1963) who conducted a two-phase trial in a sample of women hospitalized for manic-depressive illness, depressed type, involutional depression, or depressive reaction. In the first phase, patients were randomly assigned to four treatment groups of which two (six patients each) were ECT + placebo and placebo + imipramine (mean dose = 180 mg/day, range = 150 to 220 mg/day). Hamilton Rating Scale Scores obtained by blind raters after 5 weeks showed a change (improvement) score of 22.3 ± 1.6 for the ECT group, compared with only 11.7 ± 4.5 for the imipramine group ($t = 5.44$, $p < .005$). Fourteen new patients were then added to the study, four to receive ECT and 10 to receive imipramine at a higher dose (mean = 258 mg/day, range = 215 to 270 mg/day). This time, the improvement score after 5 weeks for the imipramine group was 25.1 ± 1.8, significantly greater than that of 22.5 ± 1.6 for the total of 10 ECT patients ($t = 3.41$, $p < .005$). (The authors erroneously concluded that the two treatments in this phase are "identical," but fortunately provide means and standard deviations for the inquisitive reader.) A major problem with this study is its very small sample size.

The second study is that reported to the Medical Research Council of Great Britain by its Clinical Psychiatry Committee (1965) Two-hundred sixty-nine patients with endogenous depression were randomly assigned to four different treatment groups. One group received four to eight ECT treatments ($N=65$) and another received imipramine ($N=63$) at a dose of 100 to 200 mg/day (mean = 193 mg/day). Fifty-eight patients in each group completed the first 4 weeks of treatment, at which time blind assessments on a 15-item depression rating form showed 71% of the ECT group recovered or markedly improved, compared with 52% of the imipramine group ($X = 4.99$, $p < .05$).

Thus, of two methodologically adequate studies, one shows a clear advantage for ECT over moderate-dose imipramine, and one shows a slight advantage for high-dose imipramine over ECT. The remainder of the ECT vs. TCA studies reviewed (Alexander, 1972; Angst, Varga, & Shepherd, 1967; Avery & Winokur, 1976; Bratfos & Haug, 1965; Bruce, Crone, Fitzpatrick, et al., 1960; Coryell, 1978; Fahy, Imlah, & Harrington, 1963; Greenblatt, Grosser, & Wechsler, 1962; Hutchinson & Smedberg, 1963; Kristiansen, 1961; McDonald, Perkins, Marjerrison, & Podilsky, 1966; Ravn, 1966; Robin & Harris, 1962; Wittenborn, Plante, Burgess, & Maurer, 1962) have the methodological problems detailed in the Table.

The study by Greenblatt et al. (1962) exemplifies the problem presented by well-known studies which must nonetheless be rejected as methodologically inadequate. The study employed random assignment, blind evaluations, and adequate drug dosages. It also correctly concluded that ECT was superior to imipramine in the total sample of 281 patients. Unfortunately, the sample was diagnostically heterogeneous and

Coryell, 1978	+						

included 51 psychoneurotic depressives, 60 schizophrenics with depression, and 44 patients diagnosed only as "other." Thus, more than half the sample was nonendogenous, and cannot be combined for analysis. They do present a table displaying global improvement rates separately for each diagnostic subgroup, including the two presumably endogenous categories of manic-depressive, depressed ($N=76$), and involutional psychosis ($N=50$), but no statistical analyses or significance levels are described and the table is presented in such a peculiar fashion that the reader is unable to conduct his own analysis. An unsupported statement appears in the text that (among 28 other comparisons) ECT was no better than imipramine in the manic-depressives but was more effective than imipramine in the involutionals. In view of the multiple significance tests performed, the latter conclusion is unwarranted.

There is an additional problem with the ECT vs. TCA literature. Recent data suggest that optimal TCA therapy requires plasma-level monitoring, and several investigators have reported a significant relationship between TCA plasma levels and clinical outcome (Glassman & Perel, 1978). The largest study is that of Glassman, Perel, Shostak, et al. (1977), who treated 42 nondelusional endogenous depressives with a fixed (mg/kg) dose of imipramine and related plasma levels of this drug to clinical response as measured by changes in depression rating scale scores. The proportion of imipramine-responders increased in a stepwise fashion and was 29% in the group with plasma levels <150 ng/ml, 64% at 150-225 ng/ml, and 93% in the patients with levels exceeding 225 ng/ml, a figure quite comparable to improvement rates obtained with ECT in other studies. This study is marred by the fact that the authors do not specify their precise criteria for defining "responders" and "nonresponders."

Nonetheless, the results of the Glassman et al. (1977) study suggest that a valid comparison of the effects of ECT and TCA requires plasma-level monitoring in order to provide optimal TCA therapy. The need for such a study is obvious and should take first priority in future assessments of the efficacy of ECT.

Factors Affecting Outcome After Successful Electroconvulsive Therapy

Roger F. Haskett, M.B.B.S.[1]

Electroconvulsive therapy (ECT) is accepted as an effective treatment for certain acute psychiatric syndromes, particularly the major affective disorders. Unfortunately, a significant number of patients relapse within a few months of a successful course of ECT. When examining this observation, it is important to consider the natural history of these illnesses and some popular assumptions about the long-term effects of treatment. Major affective disorders are commonly episodic and have a high spontaneous remission rate. It is usually impossible, however, to predict the duration of an untreated episode or the length of time that would elapse before the appearance of another episode. Pharmacotherapy of major affective disorder appears to assume that treatment reverses the pathogenetic process responsible for the clinical syndrome, but that the unidentified primary pathology persists. Antidepressant medication is continued for 6-12 months after clinical remission to prevent reappearance of the episode. Although there is no objective criterion for determining the appropriate time to withdraw medication, clinicians frequently deal with the uncertainty by extending the duration of treatment. By comparison, a course of ECT cannot be prolonged without definite indications. The number of treatments given to an individual must be limited because of concerns that excessive ECT produces serious side effects on cognitive functioning. In addition, outpatient ECT has many practical difficulties. The combination of the need to use ECT sparingly, and the lack of criteria for determining the spontaneous endpoint of an episode, have led to great variation in the long-term management of patients with ECT.

In the absence of objective markers for the therapeutic effects of ECT, clinicians have adopted various arbitrary guidelines to determine the "optimal dosage" of ECT. The twofold aim is to produce a full remission of the acute psychopathology and a low relapse rate. These guidelines are usually empirical and in most cases

---

[1] Department of Psychiatry, University of Michigan, Ann Arbor, MI 48109.

inadequately tested by appropriately designed clinical studies. An inflexible number of treatments or duration of the course of ECT is sometimes prescribed without consideration for the clinical response of the patient. A frequently recommended practice consists of giving an additional two treatments after full remission of symptoms. Most commonly, clinicians are advised to treat until the psychopathology has resolved with the proviso that a certain minimum and maximum number of treatments are advised (American Psychiatric Association Task Force Report #14, 1978).

Clinical indications for followup treatment are more confusing than those dealing with treatment of the acute disorders. There appears to be little consensus on the risks of giving no continuation treatment, or the efficacy of specific medications or maintenance ECT in preventing relapse. Some clinicians believe that the characteristics of the original course of ECT significantly influence the relapse rate, whereas others suggest that outcome depends upon the use of prophylactic treatment and the natural history of the disorder.

A review of the literature does not provide the date to resolve these uncertainties. Interpretation of many reports is hindered by the use of different diagnostic systems and limitations in study design. Despite these constraints, there are several studies which provide some information on the outcome of successfully treated patients who have differing post-ECT interventions.

There are two reports which compare maintenance ECT with no treatment after recovery from the acute illness. Maintenance ECT was given on a varying schedule but no more than one treatment per month. The control or untreated groups consisted of patients who refused the offer of maintenance therapy. Geoghegan and Stevenson (1949) reported that 100% (13/13) of patients receiving maintenance ECT were well after 3 years and only 15% (2/13) relapsed in the subsequent 2 years (Stevenson & Geoghegan, 1951). By comparison, 100% (11/11) of patients who refused continuing treatment had relapsed within 3 years. All subjects had suffered two episodes in the 5 years prior to the study and "most" suffered from manic depressive illness. Karliner and Wehrheim (1965) offered a similar choice to 210 patients who had suffered a psychotic episode in the previous year which was successfully treated with ECT. After 6 years, only 12% of the patients treated with maintenance ECT had relapsed in contrast to 79% of the patients who had refused further ECT.

Although both studies showed a prophylactic effect for maintenance ECT, these results may not be replicated with randomly assigned patients recovering from their first psychiatric episode. The studies do demonstrate the difficulty in differentiating a relapse of the same episode of depression from the appearance of a new episode. The first study consisted of patients who already had evidence of frequently recurring episodes. The second study probably included many patients who had relapsed into the same episode after a temporary remission. The likelihood that these patients would suffer another episode within the followup period would depend upon the natural history of each patient's illness as well as the nature of the acute treatment. The effect of the patient's past history on his or her acceptance of maintenance therapy is also unlikely to be randomly distributed. The ability of maintenance ECT to sustain a remission during a single episode of illness, or prevent the occurrence of new episodes cannot be determined from these studies.

Thomas (1954) provided one of the earliest retrospective surveys of the long-term outcome of ECT. He examined the records of 307 patients and noted that 69% recovered or were much improved and another 28% were improved by a course of ECT. This author defined a "relapse" as a need for ECT within 4 weeks of original course of treatment. A "recurrence" occurred more than 4 weeks after treatment. Thomas found that 26% (81/307) of the patients "relapsed" and 91% (74/81) of these occurred by the 16th day post—treatment. Two hundred nineteen patients were followed for a further 12 months while receiving no somatic or pharmacological therapy. Fifty patients (23%) required readmission, further ECT, or committed suicide. Examination of the "recurrence" rates for these 219 patients revealed an interesting association. Sixteen percent (26/160) of the patients with an uneventful initial recovery had a "recurrence" during the subsequent year, whereas "recurrence" occurred in 41% (24/59) of the patients who "relapsed" during the initial course of treatment.

In one of the early attempts to find an objective marker for an adequate course of ECT, Roth, Kay, Shaw, and Green (1956) studied pentothal-induced delta wave EEG activity. They reported that 29% (12/41) of patients in their study suffered a relapse during the first 12 weeks after treatment. Eleven of these relapsing patients had failed to meet their criterion of EEG change with ECT. Further development of this potential marker for an unfavorable prognosis following ECT does not appear to have occurred. Strain, Brunschwig, Duffy, Agle, Rosenbaum, and Bidder (1968) compared the outcome of depressed patients treated with unilateral or bilateral ECT. Thirty-seven percent (17/45) of patients receiving bilateral ECT and 34% (17/50) receiving unilateral ECT relapsed during the 12 months after treatment. These two reports are notable, since they were prospective studies and provide information on the relapse/recurrence rates in depressed patients given no further treatment after successful ECT.

There is one study (Barton, Melta, & Snaith, 1973) which examined the effect on relapse rate of an additional two ECT after symptomatic relief. Fifty patients completed a course of ECT with random assignment to one of two groups. The groups whose ECT ended as soon as depressive symptoms disappeared had a 50% (13/26) relapse rate during the subsequent 3 months. The group receiving two additional ECT had a 42% (10/24) relapse rate for a similar period. These rates were not significantly different. They did find, like Thomas (1954), that most of the relapses occurred within 2 weeks after treatment was completed.

There are three reports of the relapse rates in depressed patients assigned randomly to maintenance medication at the time of beginning ECT. Each study followed its patients for at least 6 months. Seager and Bird (1962) compared imipramine, 75 mg/day, with placebo. Seventeen percent (2/12) of the patients taking imipramine relapsed in the 6 months after ECT compared with 69% (11/16) of those taking placebo. A similar study (Imlah, Ryan, & Harrington, 1965) compared the efficacy of phenelzine, imipramine, and placebo. Placebo was discontinued at the time of discharge from hospital. Patients maintained on imipramine, 75 mg/day, or phenelzine, 45 mg/day, had a relapse rate of 22%, whereas those on no medication had a relapse rate of 51% during the 6-month period. The third study (Kay, Fahy, & Garside, 1970) compared the effects of diazepam, 4-12 mg/day, with amitriptyline, 50-150 mg/day. Forty-seven percent (24/51) of the former group relapsed, including three suicides, whereas only 24% (8/34) of those taking amitriptyline relapsed. These studies showed a high relapse rate for patients continued on a minor tranquilizer, placebo, or no medication and a much lower relapse rate if maintenance antidepressants were prescribed. The actual relapse rates for patients taking antidepressants may have been influenced by the fact that many individuals were taking lower dosages than are considered therapeutic today. The relapse rate for patients continued on lithium was also compared with patients taking tricyclics in a retrospective chart review (Perry & Tsuang, 1979). Both groups of patients had similar relapse rates of 20 and 21%, respectively. The three prospective medication studies were also designed to examine the belief that concurrent medication shortened the duration of, or decreased the number of treatments in, an acute course of ECT. In all cases, there was no significant difference in the course of ECT treatment when antidepressant medication was also given.

In a recent study, Coppen, Abou-Saleh, Milln, Bailey, Metcalfe, Burns, & Armond (1981) compared the efficacy of continuation therapy with lithium against placebo. The outcome measure used in this report was the mean number of weeks spent in a relapse during the followup period. During the first 6 months after ECT there was no significant difference between the group taking lithium and the group taking placebo. The group taking lithium, however, showed much less evidence of relapse during the second 6-month period (mean time in relapse of 0.2 weeks) compared with the patients taking placebo (5.6 weeks).

In conclusion, there is ample evidence that the relapse rate after a course of ECT is unacceptably high unless some form of maintenance antidepressant therapy is administered. There has been little progress in the identification of specific treatment practices, or objective markers of therapeutic effect, which can identify those patients with a good prognosis after ECT. The endpoint of a course of treatment remains arbitrary and there is no reliably demonstrated method for determining which patients require prophylactic treatment to prevent relapse or recurrence.

It is possible that the characteristics of a course of ECT are no more able to influence the subsequent relapse rate than the initial treatment of melancholia with antidepressant medication. The tendency to relapse may be a function of the natural history, or subsequent duration of the episode, and may respond only to some form of continuation therapy. Studies which examine these questions must attempt to match patient groups for number of previous episodes, duration of current episode, and known recurrence rate. The development of biological markers which reflect the pathophysiology of the disorders and which can be used to monitor the therapeutic effect of ECT may enable the clinician to develop more objective guidelines for the administration of ECT. These markers may be neurophysiological or neurochemical, but perhaps the most hopeful developments have occurred with the use of neuroendocrine strategies. These are discussed in another section of this series.

Electroencephalographic Correlates of ECT

Richard D. Weiner, M.D., Ph.D.[1]

Introduction

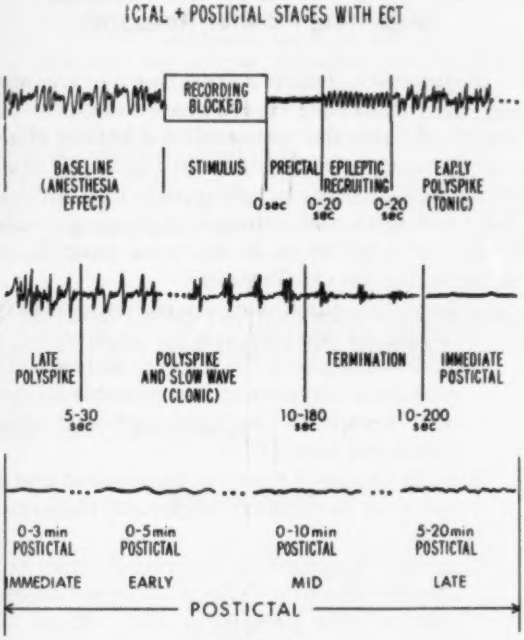
Electroconvulsive therapy (ECT) has a variety of effects upon the cerebral physiology, some of which may be correlated with therapeutic and adverse behavioral changes. From the early days of ECT, a routine test of cerebral function, the electroencephalogram (EEG), has proved to be a valuable means to observe and analyze the electrophysiologic correlates of these effects (Fleming, Golla, & Walter, 1939; Small, Small, & Milstein, 1978). The types of EEG changes seen with ECT can be subdivided chronologically into ictal, immediate postictal, interictal, and persistent categories.

The Ictal EEG

The prime function of the electrical stimulus used with ECT is to produce a generalized, major-motor type seizure. As such, the ictal EEG activity seen with ECT is strikingly similar to that observed with spontaneously occurring grand mal seizures. Electrically induced seizures may last anywhere from a few seconds to, rarely, many minutes, with typical mean seizure durations ranging from 45 to 60 seconds. The ictal EEG can itself be subdivided, again on a temporal basis, into 5 phases: preictal, epileptic recruiting activity, polyspike activity, polyspike and slow wave activity, and termination, as shown in A and B of the Figure.

---

[1] Durham Veteran's Administration Medical Center and the Department of Psychiatry, Duke University Medical Center, Durham, NC 27710.



FIGURE

The preictal phase of the impending seizure is not commonly seen with ECT, since seizure onset is generally immediate, or is at least underway by the time EEG amplifiers have begun to unblock. When seen, this phase typically presents as a period of relative suppression (*see* A of the Figure).

The earliest ictal phase generally seen in the EEG is rhythmic 18-22 Hz beta activity, typically occurring in a bilaterally synchronous fashion and lasting from a fraction of a second to no more than a few seconds (*see* A of the Figure). This activity can be called the epileptic recruiting rhythm, in deference to the use of this term in epileptology. For unknown reasons, this phase often appears absent.

The recruiting rhythm gives way to a chaotic mixture of high amplitude polyspikes which mark the tonic and early clonic convulsive movements accompanying the seizure (*see* A and B of the Figure). This phase lasts from a few seconds to tens of seconds, with approximately 10-20 seconds being most common.

Often in a piecewise fashion, the polyspike activity begins to break up into a regular pattern of polyspike and slow wave discharges, which begin at a frequency of 4-6 Hz, eventually slowing to 1-2 Hz (*see* B of the Figure). This phase, which generally makes up the bulk of the seizure duration, may not always be as well formed as described above, however, and may present as a mixed polyspike and polyspike/slow-wave pattern. The clonic convulsive movements always end before, or at least concurrent with, the end of this phase.

The termination phase of the seizure may be quite varied, ranging from an abrupt dissipation, termed by Blachly and Gowing (1966) as the "fit switch," to a breaking up of the polyspike/slow-wave activity into an irregular mixture of polyspikes and slow waves of steadily diminishing amplitude which may last for up to 30 seconds or, rarely, more. A typical termination phase is shown schematically in B of the Figure.

As far as one can tell electroencephalographically, the seizure onset is generalized, suggesting an early diencephalic activation of corticoreticular pathways, yet there is some suggestive evidence for a local onset within the hemisphere of stimulation with unilateral ECT (Staton, Hass, & Brumback, 1981). In addition, there have been a number of reports of unilateral seizures with unilateral ECT, presumably in response to barely threshold stimuli. Another reported difference between unilateral and bilateral ECT is with respect to the magnitude of ictal activity, with both EEG amplitude and the intensity of clonic convulsive movements being asymmetric with unilateral ECT (Kriss, Halliday, Halliday, & Pratt, 1978). Although ictal EEG differences between sine wave and pulse stimulation have not been investigated, there have been reports that clonic movements may be less intense with the latter (Marshall & Dobbs, 1959). In general, seizure duration appears to be independent of electrode placement and stimulus waveform, except that with small interelectrode distances, seizures produced by sine wave unilateral stimulation may be somewhat abbreviated (Weiner, 1980a).

The Postictal EEG

Immediately postictally, there is some degree of suppression of EEG activity, much as there is following spontaneous grand mal seizures. The degree of suppression is quite variable, and is more prominant with longer seizures and with bilateral stimulation. With unilateral stimulation, the suppression is typically greater over the stimulated hemisphere, as one would expect given the higher amplitude of ipsilateral ictal EEG activity. In observing the postictal EEG in cases where little suppression occurs, one must take into account the fact that some degree of high amplitude mixed slow and fast activity may be present due to the effects of the barbiturate anesthesia and that this should not be confused with continuing ictal activity. By 10 to 15 minutes postictally, the EEG gradually returns to its baseline state, with an initial appearance of very slow delta activity followed by theta, alpha, and beta rhythms (*see* C of the Figure). This shift toward higher and more normal-appearing frequencies is most easily observed in records showing the greatest degree of suppression.

The Interical EEG

Interictally, the most prominent type of EEG finding is the presence of generalized slowing in the theta and delta ranges. This slowing may be either regular or irregular in morphology, is frequently accentuated by drowsiness and by hyperventilation, and is greater for both bilateral stimulation and with the use of sine wave stimuli (Weiner, Rogers, Davidson, & Miller, 1981). Though most often bilaterally synchronous, the slowing may occasionally be greater over the stimulated hemisphere with unilateral ECT. The degree of slowing varies quite a bit among individuals, but clearly increases with the number of treatments.

The Persistence of EEG Effects

The persistence of EEG changes, chiefly slowing following ECT, also appears to be quite variable. A recent review of this literature indicates that in most cases slowing disappears within the first month, and only rarely is it present past 3 months (Weiner, 1980b). The role of electrode placement and stimulus waveform in the persistence of EEG abnormalities is presently unclear.

Summary and Recommendations Regarding Further Research

In summary, despite a great deal of variability, the EEG correlates of ECT are relatively well described, and though occasional severe abnormalities may exist on an acute basis, the risk of permanent adverse changes appears low. Although much is known about these correlates, a number of pertinent questions in this area await further investigation for clarification:

1) In what fashion does the electrical stimulus induce the seizure?
2) To what degree is the seizure, and each of its structural components, responsible for both the therapeutic and the adverse effects associated with ECT?
3) Is the degree of postictal suppression and the speed of its recovery important therapeutically?
4) Is there a difference, in terms of either therapeutic or adverse effects, between patients who develop prominent EEG effects and those who do not?
5) What is the true incidence of long-lasting EEG abnormalities with ECT?
6) What roles do electrode placement, stimulus waveform, and stimulus intensity have in these EEG correlates, particularly in the persistence of EEG changes?

In attempting to answer these questions, we may arrive at a better understanding not only of how ECT works, but also in how it should be optimally used.

Short- and Long-Term Cognitive Effects of ECT: Part I—Effects on Memory

Trevor R.P. Price, M.D.[1]

Introduction

In this article and the one that follows, the effects of electroconvulsive therapy (ECT) on various cognitive functions, both short- and long-term, will be reviewed. In the interest of simplification and clarity, they will be discussed in two separate sections: one dealing with the effects of ECT on memory function and the other with the effects of ECT on nonmemory-associated cognitive function. Obviously this is a heuristically useful though somewhat artificial distinction, since memory capacity is an important underlying component of at least some so-called nonmemory-associated cognitive functions.

In attempting to understand the effects of ECT on neuropsychological and cognitive functions, it is crucial to bear in mind that the diseases for which it is most frequently used, i.e., major depressive disorder and schizophrenia, may themselves cause significant changes in these functions. It is therefore important, but at the same time often difficult, in patients receiving ECT to separate out the extent to which observed cognitive changes are due to the treatment as opposed to the underlying disease. The article by Nasrallah in this series speaks to this issue in greater detail.

Memory Dysfunction Associated with Depression

Patients with depression may have impaired concentrating ability and experience difficulty in focusing attention (Wexler, 1980). Depression may also cause impaired memory function (Sternberg & Jarvik, 1976) of a particular type. It has been shown that short-term memory, which is dependent on registration, is impaired, while long-term memory, which is dependent on retention and recall, is not (Cronholm & Ottosson, 1961). Further, it is thought that impaired registration is a result of concentration and attention deficits, so-called "prograde effects" (Reichert, Benjamin, Neufeldt, & Marjerrison, 1976). It has been shown that when patients are treated, improvement in depression and short-term memory function are highly correlated and tend to be proportional in magnitude. In general, as will be detailed below, the memory impairments resulting from ECT tend to be just the reverse of those associated with depression. There may be uncertainty in some cases as to whether observed memory problems are due to depression or to the effects of ECT. Squire, Wetzel, and Slater (1979) have developed a self-rating instrument which may allow for differentiation between them. Using this scale, they showed that the patterns of memory complaints 1 week and 6 months post-bilateral ECT were qualitatively similar to each other, though quantitatively different, with the memory impairment at 1 week, as expected, being greater. In comparison to the pattern obtained before treatment, however, the two post-treatment scores differed both qualitatively and quantitatively, allowing for clear differentiation between them.

Methodological and Technical Issues

In reading the literature on the cognitive effects of ECT, one must be aware that much of the work

---

[1] Department of Psychiatry, Dartmouth Medical School, Hanover, NH 03755.

done in the past on the effects of ECT on memory and cognition has suffered from inadequate research methodology. There has been a great need evident in earlier studies, which has only in recent years begun to be met, for more standardized and sophisticated assessments of memory function (Harper & Wiens, 1975).

One must also bear in mind that conclusions regarding ECT's effect on memory depend to a great extent on how one measures memory function (Squire & Miller, 1974) and what one is measuring. Thus the experimental methodology employed; the sensory modality that is mediating memory, be it auditory, visual, or tactile; the content of the material administered, whether verbal or nonverbal; and whether one is measuring recognition, recall, relearning, or forgetting (the differences between immediate and delayed reproduction scores) are all important in interpreting and comparing the results of studies of the effects of ECT on memory function.

One should also be aware that while much is now known with a reasonably high degree of certainty about the effects of differential electrode placement on certain cognitive and memory functions, so-called laterality effects, their relationship to the type of stimulus waveform, and the frequency and intensity of stimuli and seizures have not thus far been adequately investigated.

The Effects of ECT on Memory Function

Memory impairment is a frequent and distressing, though for the most part, reversible, consequence of ECT. It occurs in a variety of forms which will be discussed below, and its nature and severity depend to an important degree on where and how the electric stimulus is delivered. While over the years this has been a subject of considerable debate, there is now widespread agreement that memory deficits are neither correlated with nor necessary for clinical improvement with ECT (Korin, Fink, & Kwalwasser, 1956; Fink, 1974; Squire, 1977; Dornbush & Williams, 1974). They are thus considered undesirable and often largely avoidable side effects of ECT.

General Aspects of ECT-Induced Memory Dysfunction

ECT can induce both retrograde and anterograde amnesia and has deleterious, though generally variable and transient, effects on immediate, intermediate, and remote memory (Fink, 1977). It has relatively little effect on short-term memory; its major impact is therefore on long-term memory (Dornbush & Williams, 1974; McGaugh & Williams, 1974).

Bilateral ECT seems to accelerate the process of normal forgetting (Squire, Wetzel, & Slater, 1978). Immediately following each treatment it induces a global anterograde amnesia which by 30 to 45 minutes later has become a well-circumscribed deficit characterized by good immediate memory, rapid forgetting, and temporally graded retrograde amnesia occurring in the absence of confusion or intellectual impairment (Squire et al., 1978; Squire, 1977). After ECT, memory performance is best on recognition testing and worst on recall testing, with relearning intermediate but tending to be more similar to recall than recognition (Dornbush & Williams, 1974). Evaluation of the ability to retain information following ECT is most sensitivity accomplished by the use of recall or relearning rather than recognition testing paradigms. While the ability to recall information is generally more important to patients than simple recognition, it is also considerably more difficult to test.

With ECT there is amnesia (of variable duration) for the seizure itself as well as for immediate pre- and posttreatment periods (Fink, 1977). While memory impairment is typically seen immediately after a treatment is over, its onset may occasionally be delayed for up to 24 hours (Hargreaves, Fischer, Elashoff, & Blacker, 1972). In general terms, Ottosson (1968) has described ECT as transforming the memory disturbance associated with depression from one characterized by poor learning with normal retention to one characterized by normal learning with poor retention.

It is believed that the severity and duration of ECT-induced memory impairments are positively correlated with the number, frequency (Squire & Miller, 1974; Korin et al., 1956; Dornbush, Abrams, & Fink, 1971; Fromholt, Christensen, & Stromgren, 1973), and intensity (Fink, Kahn, & Green, 1958; Ottosson, 1960; McGaugh &

Alpern, 1966) of the electrical stimuli given as well as of the seizures experienced (Laurell, 1970; Ottosson, 1960; Small & Small, 1972).

While increased frequency of treatments may have important implications with bilateral ECT, this may not be the case with unilateral nondominant ECT. Thus, Stromgren, Christensen, and Fromholt (1976) found that four unilateral nondominant treatments per week, as opposed to two, resulted in greater improvement in memory due presumably to more rapid improvement in the underlying depression. Likewise, Abrams (1967) found no greater memory impairment when unilateral nondominant ECT was given on a daily basis as opposed to three times a week.

While early studies suggested that alternating current sine wave stimuli caused more severe cognitive effects than other types of stimulus waveforms (Lieberson, 1953; Valentine, Keddie, & Dunne, 1968), more recent work has indicated that differences between brief pulse and sinusoidal waveform are not likely to be major factors in determining the degree of memory dysfunction associated with ECT (Weaver, Ives, Williams, & Nies, 1977; Weiner, Rogers, Davidson, & Miller, 1981; Spanis & Squire, 1981).

Some work with multiple monitored ECT has reported that it causes both anterograde and retrograde memory disturbances no greater in extent and severity than those seen after a single conventional treatment of the same type and of lesser proportions than if the same number of seizures had been induced individually on an alternate day schedule (Abrams & Fink, 1972).

Giving ECT via unilateral as opposed to standard bilateral administration substantially decreases the extent of memory impairment. Treating unilaterally over the nondominant or dominant hemispheres will also result in major differences in the kinds of memory impairment that occur. These differences will be discussed in detail in a later part of this review.

Administering ECT via anterior bifrontal (Inglis, 1970; Abrams & Taylor, 1973) as opposed to standard bitemporal electrode placement has been reported to lead to a reduction in memory dysfunction while achieving therapeutic efficacy intermediate between unilateral and bilateral ECT.

Stimulating unilaterally over various combinations of anatomic areas seems to have relatively little effect on memory dysfunction. Thus, there is no difference in the impact on memory between nondominant unilateral fronto-parietal and temporo-parietal lead placements (d'Elia & Widepalm, 1974). The findings are somewhat more complex in regard to comparison between fronto-frontal and temporo-parietal lead placements. While two earlier studies reported no difference in anterograde memory function between them both for verbal as well as nonverbal material (d'Elia, 1976; d'Elia, Frederiksen, Raotma, & Widepalm, 1977), a later study reported less retrograde amnesia with fronto-frontal as compared to temporo-parietal stimulation (d'Elia, 1981).

One study has indicated that the degree of immediate memory dysfunction following ECT is highly correlated with the rise in systolic blood pressure that occurs during treatment (Hamilton, Stocker, & Spencer, 1979).

Memory research in animals has shown that material ordinarily not affected by ECT may be forgotten if a reminder of it is presented just before a treatment is given (Schneider & Sherman, 1968; Misanin, Miller, & Lewis, 1968; Lewis, Bregman, & Mahan, 1972). This is known as the "reinstatement phenomenon." The evidence available (Squire, Slater, & Chace, 1976) suggests that this phenomenon does not occur in humans given ECT.

ECT-Induced Anterograde Amnesia

Both bilateral and unilateral ECT can cause anterograde amnesia which is the inability to incorporate material newly learned after ECT into long-term memory storage (Squire & Miller, 1974; Squire et al., 1976; Fleminger, Horne, Nair, & Nott, 1970a; d'Elia, 1974; Halliday, Davison, Browne, & Kreeger, 1968). Adequate investigation of ECT-induced anterograde amnesia requires the use of both immediate and delayed recall assessment devices. This is because tests of delayed reproduction which predominantly reflect retention are generally more sensitive to the deleterious effects of ECT than are tests of immediate reproduction which predominantly reflect new learning ability (Squire & Miller, 1974). Over the course of several treatments new learning ability may actually be improved. Subtracting delayed from immediate reproduction scores yields a highly useful direct measure of memory function, the so-called "forgetting score" (Harper & Wiens, 1975).

The severity of ECT-induced anterograde amnesia depends on the temporal distance from ECT of the new learning. Thus, in a study by Squire et al. (1976), recognition memory for material learned 3 hours after bilateral ECT was significantly better than for that learned 1 hour or less after ECT. Furthermore, the ability to retain material over a short (e.g., 30-minute) period recovers rapidly after ECT, being nearly normal by 3 hours after treatment. There is no cumulative impairment in this short-term measure over the first four treatments. However, the ability to retain new material over longer periods such as 24 hours appears to be much more vulnerable to the effects of ECT. Thus impairment in 24-hour retention was more severe than that seen with short-term retention given comparable amounts of ECT, and the effects of ECT were cumulative. Based on these observations, the theories that ECT causes anterograde amnesia by disrupting the ability to transfer material from short-term memory to long-term memory or to recall material from long-term memory have been advanced.

On the other hand, Squire et al. (1976) postulated that anterograde amnesia results from an ECT-induced impairment of acquisition and consolidation of new information, rather than an impairment of the ability to call upon and use information that has already been stored. Others (Cronholm & Ottosson, 1961, 1963) have suggested that ECT interferes with the memory function, retention, while concomitantly improving new learning, i.e., acquisition and consolidation, to the extent that it reverses the patient's depression. Thus, ECT may have a mixed effect on various aspects of memory function.

ECT-induced anterograde amnesia does not appear to depend on the presence of intellectual dysfunction, confusion, or disorientation following ECT. In general, it gradually recedes after each individual treatment but may be cumulative over a series of treatments (Squire & Miller, 1974).

In 1958, Lancaster, Steinert, and Frost first reported that memory and cognitive impairment due to ECT could be reduced without a major diminution in therapeutic efficacy by using unilateral rather than bilateral stimulation. Subsequently, a variety of studies clearly documented that bilateral ECT produced greater amounts of anterograde amnesia than did either unilateral nondominant (Halliday et al., 1968; Fleminger et al., 1970a; d'Elia, 1970, 1974) or unilateral dominant ECT (Jackson, 1968).

In the mid- to late sixties evidence began to accumulate that there was a differential effect of unilateral dominant and nondominant ECT on verbal and nonverbal visuospatial anterograde memory. This was based on ECT studies that employed assessment batteries which specifically tapped verbal and nonverbal memory function.

Zamora and Kaelbling (1965), using Form One of the Wechsler Memory Scale, found that unilateral dominant ECT caused deterioration in verbal memory performance whereas unilateral nondominant ECT enhanced it, an effect they attributed to ECT-induced improvement in depression in the patients they studied. However, since the instrument they used did not include delayed reproduction subtests, it is more likely that they were measuring differences in new verbal learning ability rather than true verbal memory function.

Subsequently, a study by Jackson (1968) comparing verbal and nonverbal memory effects of right and left unilateral as well as bilateral ECT showed that patients treated with right unilateral ECT had the least verbal memory impairment; those treated with left unilateral, the least nonverbal visuospatial impairment; and those treated with bilateral the greatest degree of both. Similar findings were also reported by Halliday et al. (1968), Cohen, Noblin, Silverman, and Penick (1968); and Zinkin and Birtchnell (1968).
chnell (1968).

Kozma and Galbraith (1968) reported similar results in that they noted improvement in memory with unilateral nondominant ECT, some deterioration with unilateral dominant, and marked deterioration with bilateral ECT.

Sutherland, Oliver, and Knight (1969), in a double-blind study comparing the effects of unilateral dominant, unilateral nondominant, and bilateral ECT on memory function, found that all three types of treatment improved it, and attributed this to the indirect beneficial effect of improvement in depression on cognitive and memory function. They, like others, found that the greatest degree of improvement occurred with unilateral nondominant ECT.

Two years later Cronin, Bodley, Potts, et al. (1970) showed that impairment of anterograde verbal memory as assessed by word learning and the Wechsler Memory Scale was less marked with unilateral nondominant than with either unilateral dominant or bilateral ECT. Also in 1970, Fleminger, Horne, and Nott, (1970b) reported anterograde verbal memory to be more impaired after left unilateral than right unilateral ECT.

Two more recent well-designed and executed studies (Squire & Slater, 1978; Robertson & Inglis, 1978) have provided further confirmation of the differential effects of various types of ECT on verbal and nonverbal memory. The first study, using a before and after five-treatment design, showed that right unilateral ECT impaired delayed retention of nonverbal material in the form of faces, designs, and spatial relations, without affecting delayed retention of verbal material in the form of a paragraph. In this study, as in earlier ones, bilateral ECT caused greater impairment of both verbal and nonverbal memory than right unilateral ECT. The second study, using more sophisticated dimensions of symbolism and imagery in addition to the usual verbal and nonverbal dimensions in memory testing, further confirmed the differential effects of unilateral nondominant and bilateral ECT on verbal and nonverbal memory function. Unlike earlier studies, neither of these studies directly assessed the effects of unilateral dominant ECT on verbal and nonverbal memory.

Several of the studies that showed clear-cut differential effects of various forms of ECT on memory function reported virtually identical degrees of therapeutic efficacy (Fleminger et al., 1970a; d'Elia, 1974; Halliday et al., 1968; d'Elia & Raotma, 1975). Other studies have disputed the notion that unilateral and bilateral ECT are equipotent (Abrams, Fink, Dornbush, et al., 1972; Abrams, Taylor, Faber, et al., 1981; Price, 1980). Thus, whether or not the risk-benefit ratio (Fink, 1978, 1979) with respect to potential memory effects clearly favors unilateral nondominant over bilateral ECT in all cases is at present unclear and is an issue the APA Task Force on ECT felt should be left up to the clinical judgment of individual practitioners (APA Task Force Report on ECT, 1978).

Relatively few studies have attempted to establish the duration of ECT-induced anterograde amnesia. Halliday et al. (1968) reported that verbal memory impairment persisted over at least a 3-month period after unilateral dominant ECT. This study also indicated that nonverbal memory impairment persists longer after bilateral than unilateral nondominant ECT. Bidder, Strain, and Brunschwig (1970) found verbal memory as assessed by a paired-associate learning test to have returned to baseline within 30 days of the end of courses of both unilateral and bilateral ECT. At the followup assessment, memory was better than it had been before treatment in both groups. Finally, Cronin et al. (1970) showed that differences in anterograde verbal memory resulting from unilateral dominant, unilateral nondominant, or bilateral ECT persisted for 4 to 6 weeks following a course of eight treatments.

ECT-Induced Retrograde Amnesia

As mentioned previously, retrograde amnesia, which is a lack of ability to recall events occurring prior to ECT, also occurs as a result of both bilateral and unilateral ECT though to a significantly lesser extent with the latter (Cohen et al., 1968). It is more severe with increased number and frequency of bilateral ECTs and is thought by some to increase in severity with increasing patient age (Squire, 1974; Fink, 1977), though not all researchers agree on this (Fink, 1979). It often occurs in association with confusion, disorientation, or impairment on the verbal portion of the Wechsler Adult Intelligence Scale (WAIS) (Squire, 1974), but can also be present as an isolated defect.

ECT-induced retrograde amnesia occurs for both public and autobiographical events both temporally close in occurrence to (Harper & Wiens, 1975; Dornbush & Williams, 1974; and Dornbush, 1972), as well as many years (even up to 20) prior to treatment (Squire, 1977; Squire et al., 1975; Squire, 1975; Squire, Chace, and Slater, 1976; Brody, 1944; Squire, 1974; Janis, 1950). In the past the standard explanation for retrograde amnesia due to ECT had been the "consolidation hypothesis," which held that ECT somehow disrupted neural mechanisms and processes underlying the consolidation of memory traces (Zinkin & Birtchnell, 1968; McGaugh & Williams, 1974). Current theories, however, focus more on ECT-induced interference with the "retrieval process" as the underlying mechanism (Patterson, Lawler, & Rochester, 1978).

There is a temporal gradient in retrograde amnesia induced by ECT (Squire, 1975; Squire, 1976). Thus it was shown that following five bilateral ECTs, television programs broadcasted 1 to 3 years before ECT were forgotten, whereas those broadcasted 4 to 17 years before ECT were not.

Long-term memory for temporal order, which depends on recall not just recognition, appears to be more sensitive to bilateral ECT than other aspects of memory and is, like other forms of retrograde amnesia, associated with a temporal gradient of impairment (Squire et al., 1976). Thus temporal sequencing of events occurring from 4 to 7 years before ECT was impaired, whereas it was not impaired for events 8 to 16 years before. This temporal sequencing impairment persisted unchanged for 1 to 3 weeks after the end of treatment.

d'Elia (1970) reported that unilateral nondominent ECT caused less retrograde amnesia than bilateral ECT with unilateral dominant intermediate between them.

Cohen et al. (1968) showed that five unilateral dominant ECTs selectively impaired retrograde verbal memory, while five unilateral nondominant ECTs selectively impaired retrograde nonverbal, visuospatial memory. They also showed that both verbal and nonverbal memory were more profoundly impaired by five bilateral ECTs than with a comparable number of administrations of either form of unilateral treatment.

Berent, Cohen, and Silverman (1975) replicated the findings of Cohen et al. (1968) after one unilateral nondominant, unilateral dominant, or bilateral ECT, using words or visual forms learned 24-48 hours before and tested 5 hours after ECT. Based on their observation that verbal memory impairment after five unilateral dominant ECTs was much greater than after one, whereas visuospatial memory impairment was nearly identical after both five and one unilateral nondominant treatments, they suggested that the left hemisphere and verbal memory might be more susceptible to the cumulative effects of a series of ECTs than the right hemisphere and visuospatial memory.

Clearing of retrograde amnesia following ECT occurs as a result of spontaneous recovery not via relearning or "prompting" (though this may indeed help). As would be expected from Ribot's Law of Regression (Ribot, 1885), there is greater recovery of more remote events, months to years before ECT, than of very recent events, within days of treatment, for which loss of memory may be permanent (APA Task Force Report on ECT, 1978). Ease of restitution of retrograde memory loss is directly related to the patient's motivation to remember forgotten material, the degree of personal importance and hence presumably the amount of attention paid to it, the amount of affect associated with it, the degree of familiarity with it, and the ease with which it was originally assimilated into memory storage (Williams, 1975).

Recovery from ECT-induced retrograde amnesia occurs over a variable and, thus far, not definitely determined period of time. Various studies have demonstrated persistence of retrograde amnesia over periods ranging from 24 hours (Squire, 1975) to 10 to 14 weeks (Janis, 1950), to as much as 1 year or more following ECT (Brody, 1944). The last was an early study which was uncontrolled, and assessed memory function with respect to familiar, long-known names of persons and places as well as habits of work. Several more recent studies have indicated that the recovery of memory for remote events may be substantially complete in as little as 1 to 2 weeks (Squire, 1975, 1976) or as much as 6 to 9 months post-ECT (Squire & Chace, 1975; APA Task Force Report on ECT, 1978; Squire, 1980; Squire et al., 1980). The latter two studies indicated that memory impairment for events occurring more than 2 years before ECT, as well as new learning capacity, return to normal by 6 months post-ECT. While impaired memory for events occurring during the 1- to 2-year period before ECT substantially improves over the 6 months following ECT, there may be permanent loss of memory for some of them. Most of these permanent memory "gaps" are irritating but not functionally incapacitating to the patient (Freeman, Weeks, & Kendell, 1980).

Followup Studies of Long-Term Effects of ECT on Memory

Assessing the long-term effects of ECT on memory function is difficult because, as was first described nearly 20 years ago (Cronholm & Ottosson, 1963), and more recently confirmed (Squire & Chace, 1975), patients' subjective experience of their memory function is often at odds with the results of objective testing. In general, a patient's subjective assessment of the adequacy of his or her memory function post-ECT is directly related to verbal but not visuospatial performance, the degree of affective improvement from ECT, and the adequacy of immediate reproduction capacity, i.e., learning, more than delayed reproduction capacity, i.e., retention (Cronholm & Ottosson, 1963). Given the numerous and potentially complex interactions that may occur between these variables, it is not surprising that subjective and objective assessments of memory are often at variance with each other.

Squire and Chace (1975) found no objective difference in new learning, retention memory scores, remote memory, or self-rating of memory function 6 to 9 months after unilateral nondominant or bilateral ECT or inpatient psychiatric treatment without ECT. Despite the lack of objective differences, 63% of prior bilateral ECT patients felt their memory was not as good as it had been before treatment, while only 30% of unilateral ECT patients and 17% of non-ECT-treated patients felt similarly.

Squire et al. (1979), using a self-report memory assessment scale, found that subjective complaints of memory impairment persist in a gradually diminishing fashion for up to 6 months after ECT. The complaints present 6 months after ECT differ qualitatively from the depression-associated complaints present prior to ECT and are similar to, but less marked than, those present 1 week following ECT. Thus, while their etiology is unclear, the authors suggested that they are unlikely to be due to such commonly advanced explanations as persistent low self-esteem, a general tendency to complain about memory capacity, or recurrent depression-associated memory dysfunction.

Freeman, Weeks, and Kendel, (1980) retrospectively studied patients who had had ECT (mainly bilateral) from 2.6 to 12.8 years (mean = 10 years) previously and who complained of permanent unwanted effects secondary to the ECT. They found these patients to be more depressed and anxious and to be taking more psychotropic medications than the noncomplainers. Nonetheless, even after partialling out the effects of these factors, they still found more impairment in the patients than in volunteer, nonpatient controls on 3 out of 19 wide-ranging cognitive and memory tests. In fact, a few of the patients scored in the organically-impaired range on some of the tests. The authors concluded that: ECT may induce permanent memory impairment in a very small proportion of patients who receive it; this memory loss is, for the most part, irritating but not incapacitating; and that ECT does not normally produce persistent memory defects in most patients.

In a related study, Weeks, Freeman, and Kendell (1980) studied unilateral nondominant and bilateral ECT patients as well as normal and non-ECT-treated patient controls with a battery of tests that assessed both memory and nonmemory associated cognitive function. These tests assessed recall, relearning, and recognition functions in auditory, verbal, and visuospatial modes. They also tested immediate and delayed retrieval, short and long-term memory, as well as remote (long-term) memory for both personal and impersonal material. They found that unilateral nondominant ECT patients scored close to normal controls on many of the tests after 1 week of treatment; whereas, bilateral ECT patients showed significantly greater impairment after 1 week. At 3-month followup, however, unilateral nondominant and bilateral ECT patient performances were identical. At 4- and 7-month followups both ECT patients and non-ECT patient controls showed deficits on some tests when compared to the normal controls. They also complained subjectively of memory deficits which were attributed to the effects of residual depression, medication, and/or persistent ECT-induced memory impairment.

While there have been several anecdotal reports of patients who have received very large numbers of ECT with no apparent cognitive or memory impairment, such as that of Perlson's (1945) male patient who had received 248 bilateral ECTs, other reports (Templer, Ruff, & Armstrong, 1973; Goldman, Gomer, & Templer, 1972; Teuber, Corkin, & Twitchell, submitted) have raised the possibility that large numbers of bilateral ECT (more than 50 treatments per patient) may be associated with impairment on a variety of memory tests not present in controls on followup testing many years later. The conclusion of these studies that ECT is responsible for the observed persistent impairment must be viewed with caution since, given their design and retrospective nature, the effects of underlying chronic schizophrenia, depression, and/or associated organic lesions such as cingulotomy cannot be separated from the effects of ECT.

Summary

From this review a variety of reasonably firm conclusions about the effects of ECT on memory can be drawn. These include:

1. ECT causes both retrograde and anterograde amnesia.
2. Bilateral ECT causes greater anterograde amnesia than unilateral nondominant or dominant ECT, both for nonverbal and verbal memory.
3. Anterograde amnesia severity depends on the temporal distance from ECT of the new learning in question.
4. Anterograde amnesia recedes gradually after each individual treatment, but is cumulative over a series of treatments.
5. The early time course of recovery of anterograde amnesia due to ECT is not clear but is substantially complete by at least 6-9 months post-ECT.
6. Bilateral ECT causes greater retrograde amnesia than unilateral dominant and nondominant ECT, both for verbal and nonverbal memory.
7. Retrograde amnesia is characterized by a temporal gradient, and recall of when events occurred intime is more sensitive to impairment than other aspects of retrograde memory.
8. Unilateral nondominant ECT selectively impairs nonverbal retrograde memory, while unilateral dominant ECT selectively impairs verbal retrograde memory.
9. Recovery from retrograde amnesia following ECT is substantially complete by 6-9 months; however, some events during the 1-2 years before ECT and events during the course of treatment may be lost permanently.
10. ECT-induced memory dysfunction appears to be qualitatively different than depression-related memory dysfunction, at least as assessed by self-report scales.
11. Despite lack of objective evidence of memory dysfunction several months post-ECT, patients will often complain of subjective memory impairment following treatment. These complaints are more frequent following bilateral than unilateral ECT.
12. ECT, in a small number of patients, may cause permanent memory impairment; the functional significance of this memory loss is unclear at present.
13. ECT does not normally cause enduring memory deficits, and with unilateral nondominant ECT there is generally relatively little clinically apparent memory disturbance even immediately following ECT.

Areas for Future Research

Despite the extensive investigation of the effects of ECT on memory function over the past two decades and despite the fact that, as this review indicates, much is known about this area with a reasonable degree of certainty, many questions remain, and these indicate important directions for future research.

For example, what is the true incidence of permanent memory dysfunction from bilateral ECT? Does it ever occur in patients treated with unilateral ECT? If so, how often, and is the type of dysfunction different than that seen with bilateral ECT? Is it possible to identify, prior to treatment, through biological markers or clinical profiles, that small but finite number of patients who will be prone to experience permanent ECT-induced memory impairment? Can the nature and functional significance of such deficits be better characterized, especially with respect to the kinds of impact they have on the patient's life and work?

How long do subjective memory deficits persist post-ECT and what relationship do they bear to permanent memory impairments on objective memory tests?

How do ECT, particularly unilateral nondominant ECT, and various commonly used drug treatments for depression compare in regard to causing cognitive or memory disturbances in the short-run, but even more importantly over extended followup periods after acute treatment?

Does ECT have differential effects on memory function in different diagnostic groups, for example, in patients with schizophrenia as opposed to patients with major depressive disorders? Some early studies suggested that there might be such differences but this issue has not been adequately examined with studies using rigorous experimental designs in patient populations carefully defined by current research diagnostic criteria.

Studies of the latter type, as well as rigorously designed, prospective controlled studies with long-term followups involving large enough numbers of patients so that solid statistical inferences, regarding observed differences can be drawn, are badly needed. Multicenter, collaborative studies, despite their obvious drawbacks, lend themselves uniquely well to the need to collect large numbers of experimental subjects. Carefully done, large-scale, longitudinal, studies of the incidence, nature, and natural history of various types of ECT-induced memory dysfunction are also sorely needed. Additional rigorously designed and executed studies of the relationship between ECT-induced memory changes and the electrical characteristics (waveform, intensity, duration, frequency, etc.) of the stimulus; the number, frequency, and duration of induced seizures; and various ECT-induced neurophysiological and neuroendocrinological changes would also be important additions to the literature.

Research aimed at developing means of further attenuating, or even preventing altogether, ECT-induced memory loss via additional technical modifications of ECT or pharmacological interventions with, for example, peptide hormone fragments, should also have a high priority. Efforts aimed at identifying the basic mechanisms underlying ECT's therapeutic effects should be encouraged, as these may make it possible to develop an alternate form of treatment that will have comparable therapeutic efficacy without memory impairment.

Short- and Long-Term Cognitive Effects of ECT: Part II—Effects On Nonmemory Associated Cognitive Functions.

Trevor R.P. Price, M.D.[1]

In addition to the multiple effects that electroconvulsive therapy (ECT) has on memory function, which were reviewed in the preceding article (Price, 1982), it likewise has a variety of effects on cognitive functions which are largely independent of memory. The range of cognitive domains affected include, for example, perceptual function, psychomotor speed, visuomotor ability, simple and complex sensory capacity, complex discrimination ability, and synthesizing and abstracting ability (Fink, 1979). This article will review these effects of ECT.

To understand ECT's effects on memory function or nonmemory-associated cognitive and neuropsychological function, it is important to

---

[1] Department of Psychiatry, Dartmouth Medical School, Hanover, NH 03755.

keep in mind that the diseases for which ECT finds its principal use, i.e., major depressive disorder and schizophrenia, may themselves be responsible for significant deviations from the norm in these functions. Thus the problem of how much of an observed cognitive impairment is due to the treatment as opposed to the underlying disease again confronts the clinician. For a more detailed discussion of this issue, the reader is referred to the discussion by Nasrallah in this series.

Nonmemory Cognitive Impairments Associated with Depression

Depression may be associated with nonmemory-associated cognitive dysfunctions, ranging from impaired concentration and attention (Wohlberg & Kornetsky, 1973) to a state-dependent delirium with mild to moderate, diffuse, generalized impairment on the Halstead-Reitan battery (Donnelly, Dent, & Murphy, 1972; Goldstein, Filskov, Weaver, & Ives, 1977) to the clinical picture of a profound pseudodementia with gross cognitive impairment and marked general function disability (Wells, 1979; Cavenar, Maltbie, & Austin, 1979). Unfortunately, the research literature in this area is inconsistent and at times even somewhat contradictory. For example, Small, Small, Milstein, and Moore (1972) reported no evidence of diffuse of localized neuropsychological dysfunction on Halstead-Reitan testing in a cohort of psychotically depressed patients but, subsequently, in a followup study of the same patients, reported improvement in some right hemispheric functions with ECT, suggesting the likely presence of an unrecognized asymmetric abnormality prior to treatment (Small, Small, Milstein, & Sharpley, 1973). Several other workers have also reported right hemispheric, particularly frontal, abnormalities (Tucker, Stenslie, Roth, & Shearer, 1981; Kronfol, Hamsher, Digre, & Waziri, 1978; Goldstein et al., 1977), as well as atypical patterns of hemispheric activation (Moscovitch, Strauss, & Olds, 1981) and impaired ability to learn new material (Campbell, 1957), to note just a few of the many different types of cognitive dysfunction that may be associated with depression.

Despite these interesting and provocative preliminary findings, thus far no characteristic patterns of cerebral dysfunction of hemispheric asymmetry occurring in association with depression have been clearly established (Marin & Tucker, 1981).

Cognitive Impairment Associated with Schizophrenia

In patients with schizophrenia, a variety of nonmemory-associated cognitive impairments have been found. As with depression, impaired attention and concentrating ability are common (Wohlberg & Kornetsky, 1973), as is diffuse cognitive dysfunction as assessed by the Halstead-Reitan battery as well as other tests of neuropsychological function (DeWolfe, Barrell, Becker, & Spaner, 1971; Watson, 1971). Wexler (1980) described specific left hemispheric dysfunction in schizophrenia in his review of the literature on cerebral laterality and psychiatric illness. Others (Taylor, Greenspan, & Abrams, 1979; Newlin, Carpenter, & Golden, 1981) have reported similar findings. However, Marin and Tucker (1981) and Merrin (1981) note that while some studies seem to support the notion of specific left hemispheric dysfunctions in schizophrenia, a variety of others do not. They also point out the existence of a variety of methodologic shortcomings in many of the studies that have been done in this area.

Methodological and Technical Issues

In view of the foregoing, it is clear that any research on the nonmemory-associated cognitive effects of ECT must be designed and executed so as to carefully control for and, as much as possible, eliminate the following confounding factors.

First, one must anticipate finding impaired attention and concentration as well as diffuse cognitive dysfunction in both depressives and schizophrenics. Next, presumed lateralized ECT-induced cognitive changes must be interpreted in the light of the evidence that suggests there may be differential right hemispheric dysfunction in depression and left hemispheric dysfunction in schizophrenia. One must attempt to control for patient age, treatment with psychotropic medication, intelligence quotient (IQ), education, and severity of illness, given the potentially important impact each of these may have on various cognitive functions. It is thus important that studies of the effects of ECT on cognition include age- and IQ-matched, comparably ill, medication-free, patient controls as well as normal controls.

It is also crucial to design cognitive test batteries with the practice effect in mind. Finally, in this type of research it is important to determine accurately hemispheric dominance, since just giving right unilateral ECT to all patients can result in stimulation over the dominant hemisphere in as many as 10% of cases even among strong right-handers (Clyma, 1975). Testing for dysphasia after ECT (Warrington & Pratt, 1973; Pratt & Warrington, 1972) and using the handwriting test (Levy & Reid, 1976), in addition to administering standard handedness questionnaires, can significantly increase the accuracy of determining cerebral dominance.

General Principals Regarding the Effects of ECT on Nonmemory-Associated Cognitive Function

In general, the literature during the 1940s and 1950s on nonmemory-associated cognitive effects of ECT was somewhat more extensive than that regarding the effects of ECT on memory. However, interest in this area waned in the 1960s and 1970s, though in very recent years there appears to have been a resurgence of research interest in this area in conjunction with the growth of interest in topics such as the laterality of cerebral functions, the neuropsychological abnormalities associated with various types of psychopathology, and the differential effects of dominant and nondominant unilateral ECT.

Fink (1979) reported that ECT-induced impairments in certain neuropsychological functions, e.g., perceptual acuity and psychomotor speed, are proportional to the number and frequency of seizures induced. As is the case with memory dysfunction, ECT-induced cognitive dysfunction may be delayed in its onset for up to 24 hours (Hargreaves, Fischer, Elashoff, & Blacker, 1972). Further, it has been reported that the impairments in nonmemory-associated cognitive functions are maximal at the time of the seizure and rapidly revert to pretreatment levels or better during the 14 days following the last seizure. Some evidence suggests that there is a cumulative effect on certain cognitive measures, such as the verbal Wechsler Adult Intelligence Scale (WAIS). Thus, Squire (1975) reported that the verbal WAIS had returned to normal within 40 minutes of the first bilateral ECT in a series, but took up to 48 hours to return to normal after the sixth. Three other studies suggested that with unilateral ECT, performance on a variety of psychological tests deteriorates progressively up to the fifth treatment, then improves despite continued treatment (Small & Small, 1971; Scanlon & Mathas, 1967; Fink, Kahn, Kapp, et al., 1961). Not surprisingly, simple cognitive and neuropsychological functions tend to be less severely disrupted and to return to baseline more rapidly than do complex ones.

In addition to the general changes in neuropsychological function already mentioned, ECT can cause topographical disorganization and disorientation (A Practicing Psychiatrist, 1965). Another interesting but as yet unexplained finding is that the number of errors on the Benton Visual Retention Test correlates highly with the degree of rise in blood pressure that occurs during ECT (Hamilton, Stocker, & Spencer, 1979). Furthermore, analogous to its effects on memory, unilateral dominant ECT has been reported to have greater effects on verbalization than is the case with unilateral nondominant ECT (Pratt & Warrington, 1972). Curiously, patients who have had unilateral dominant or bilateral ECT have been found to have greater difficulty with picture recognition than those who received unilateral nondominant ECT (Halliday, Davison, Browne, & Kreeger, 1968). This is thought to be due to the important influence verbal functions play in encoding visual stimuli (Williams, 1973), a role perhaps even more important than that of visual perceptual factors.

Unlike memory functions, there has been a relative paucity of investigation of the relationship between nonmemory-associated cognitive functions and stimulus intensity and waveform, the location (laterality) of stimulation, and the interaction between the cognitive effects of ECT and patient age, IQ, and sex. In fact, it has only very recently become apparent that the last-mentioned of these variables may be important in relation to general cognitive functioning (Miller, Small, Milstein, et al., 1981; Inglis & Lawson, 1981).

The Clinical Spectrum of ECT-Induced Nonmemory-Associated Cognitive Dysfunctions

Post-ECT cognitive dysfunctions span a broad spectrum of clinical presentations ranging from no apparent dysfunction to mild delirium with confusion all the way to gross delirium with flagrant organic psychotic features.

Post-ECT Confusion

Since post-ECT confusion is so frequently seen, it has, not surprisingly, been studied by a number of researchers over the years. Unfortunately, many of the articles dealing with it have failed to provide adequate operational definitions of "confusion" and have not established objective criteria for quantitative measurement of it. Despite these shortcomings, there seems to be a general consensus in these studies that bilateral ECT causes a greater degree of confusion and confusional behavior than unilateral ECT (Lancaster, Steinert, & Frost, 1958; Cannicott, 1962; Impastato & Karliner, 1966). Impastato and Karliner (1966) further reported that the degree of confusion occurring after unilateral nondominant ECT was less than that observed after unilateral dominant ECT. Consistent with this finding was that of Abrams (1967), who reported that neither confusion nor confusional behavior occurred after unilateral nondominant ECT, even when it was given on a daily basis for a large number of treatments.

Some researchers seeking to quantify the somewhat nebulous notion of confusion have employed as an objective measure the amount of time necessary after ECT for patients to regain full orientation to person, place, and time. Using this operational definition, several workers including Valentine, Keddie, and Dunne (1968); Halliday et al. (1968); Sutherland, Oliver, and Knight (1969); and d'Elia (1970) have replicated and confirmed the qualitative findings of earlier studies that unilateral ECT is followed by more rapid reorientation, and therefore less confusion, than is bilateral ECT. Fraser and Glass (1978, 1980) using a quantitative index of recovery after ECT that included, among other measures, orientation time, found that recovery was more rapid after unilateral nondominant than after bilateral ECT. Furthermore, they found that the recovery time after bilateral but not unilateral nondominant ECT increased as the course of treatment progressed, especially if the interval between treatments was shorter, e.g., 1 day, as opposed to 2 or 3 days. They also found that recovery times were longer in elderly as opposed to young patients with both unilateral and bilateral treatment modes. The differences were five times greater with unilateral and nine times greater with bilateral ECT.

Several other related studies have confirmed the fact that reorientation occurs considerably more rapidly after unilateral nondominant than unilateral dominant or bilateral ECT (Halliday et al., 1968; Sutherland et al., 1969; Wilson & Gottlieb, 1967; Cronin, Bodley, Mather, et al., 1970; d'Elia, 1970).

As is true with memory dysfunction following ECT, post-ECT confusion does not have prognostic implications as far as treatment outcome is concerned, nor is it a necessary concomitant of affective improvement. Thus, Wilcox (1953) found that there was no relationship between prolonged confusion after the first ECT, nor the degree of cumulative confusion after the tenth ECT in a series, and the results of a full course of ECT, either in respect to affective or cognitive outcome.

Acute Organic Mental Syndromes

ECT-induced acute organic mental syndrome, as it is currently known, is a clinical syndrome characterized by variable symptomatology ranging from mild confusion and bewilderment to grossly psychotic signs and symptoms in association with global cognitive impairment. It was first described in 1945 by Kalinowsky and has since been reported in a number of studies (Gallinek, 1952; Ottosson, 1968; Elmore & Sugerman, 1975; Arnot, 1975; Summers, Robins, & Reich, 1979; Fink, 1979; Marshall, Kalin, & Tariot, 1980).

This syndrome may be characterized by any or all of the following: difficulty concentrating, gross disorientation and confusion, a sense of perplexity and bewilderment, perseveration and circumstantiality, aphasic and apraxic symptoms, facial and body dysgnosias, and hallucinations and delusions (Kalinowsky, 1945). Typically such episodes clear suddenly and, according to Kalinowsky (1945), they frequently clear within 7 to 10 days of their onset.

In a recent series (Summers et al., 1979), 40% of patients receiving bilateral ECT developed acute organic mental syndromes. These varied in severity, developed after a mean of 5.5 bilateral ECTs, had a mean duration of 20.1 days, and were seen more frequently in patients with a history of major medical illness or in patients who were on psychotropic drugs, especially drugs having anticholinergic effects. The last finding, of course, is consistent with the widespread clinical experience that ECT and anticholinergic agents may have additive deliriogenic effects. Similarly, a number of recent reports (Ayd, 1981; Mandel, Madsen, Miller, & Baldessarini, 1980; Small, Kellams, Milstein, & Small, 1980; Weiner, Whanger, Erwin, & Wilson, 1980) indicate that ECT and lithium in combination may have a particular propensity in some, but not all, patients to cause reversible acute organic mental dysfunction.

Fink (1974) has reported an increased frequency of acute organic mental syndromes with increased numbers and frequency of bilateral ECTs. Abrams and Fink (1972) also reported, in a preliminary fashion, that the incidence of prolonged organic confusional states seemed to be greater with multiple monitored than with comparable conventional ECT.

A variety of other related post-ECT phenomena have also been reported. Gottlieb and Wilson (1965) reported dysphasia in the form of mumbling and jargon speech especially after unilateral dominant ECT. Clyma (1975) reported finding similar dysphasis in his patients which typically resolved within 30 minutes of ECT. Annett, Hudson, and Turner (1974) also reported that dysphasia, as reflected in a naming task, was more pronounced after left than right unilateral ECT. In this same study, however, no difference between the modes of stimulation could be found in their effects on visual discrimination tasks.

There have been reports of transient neurological signs and symptoms occurring immediately after ECT (Kane, 1963; Kriss, Blumhardt, Halliday, & Pratt, 1978; Impastato & Karliner, 1966). These neurological findings have been mainly contralateral to the side of stimulation, transient with resolution within 20 minutes of treatment, and include decreased contralateral sensory discrimination, transient flaccid hemiparesis and even paralysis, asymmetric deep tendon reflexes, tactile and visual inattention (agnosognosia), and homonymous hemianopsia.

Early Psychometric Studies of Nonmemory-Associated Cognitive Effects of ECT

In the 1940s, in response to fears as to the potential for ECT to cause significant and perhaps even permanent brain damage, Perlson (1945) published a report of a male patient who had received 248 bilateral ECTs over a 2-year time span. When assessed with an extensive battery of tests following this 2-year period, he was found by the author to be of superior ability in comparison to the general population, to have "intellectual ability slightly better than expected for college level performance," and to have experienced no greater change in intellectual functioning than would have normally occurred as a consequence of 2 years of aging.

Stone (1947) reported generalized cognitive dysfunction, of which amnesia was only a part, occurring in association with from 4 to 20 ECTs. He noted that it progressively increased in severity with ECT from prior to the first treatment to from 24 to 30 hours after the last ECT and subsequently gradually diminished over the next 2 weeks. The kinds of post-ECT cognitive impairment he found included: decreased calculating ability, decreased auditory and reading comprehension, decreased ability to think abstractly and perceive interrelationships, decreased ability to make choices and clarify issues, and diminished ability to arrange words or objects according to a specified plan.

Luborsky (1948) found the effects of ECT on cognitive function to differ in schizophrenics and depressives. He gave each patient group a diverse battery of psychometric tests before ECT, after the 10th or 11th treatment, and 5 or 6 days after a completed series of 12 treatments. In the schizophrenics, he found impaired organizational-synthetic, visuomotor, and fluency of association functions after the 10th or 11th treatment in comparison to baseline, which he felt suggested the presence of organic brain dysfunction, but he could find little or no evidence of impairment 5 to 6 days after the last ECT. His depressed patients showed a different pattern, with progressive improvement from baseline to posttreatment testing, without the initial impairment.

Huston and Strother (1948) administered the Babcock and Shipley-Hartford test batteries to depressed patients prior to ECT and 11 days and 6 months after the last treatment. The former battery includes 31 items that assess memory, attention, and psychomotor speed; the latter taps vocabulary and abstract thinking. At 11 days post-ECT, the results on the Babcock were slightly improved. At the 6-month posttreatment followup, statistically significant improvement had occurred with both.

Fisher (1949) demonstrated improvement in a variety of cognitive functions in depressed patients who had improved clinically with bilateral ECT, when pretreatment performance was compared with performance 14 days after treatment. He found significant changes in synthesizing ability, abstracting ability, speed of ideation, visuomotor ability, and estimation of self-performance.

Stone (1950) reported two patients who had received 14 and 20 ECTs, respectively, who manifested neither objective nor subjective diminution in performance on a battery of cognitive and intelligence tests from before to after ECT.

Pascal and Zeaman (1951) reported four patients in whom serial testing was done before, during, and after ECT with four different cognitive tests. These tests were: a noun-naming test, a color-naming test, the Bender-Gestalt, and a serial subtraction test. They found improvement in the tests early in the course of ECT followed by worsening as the course of treatment progressed with return to pretreatment baseline levels or better within several days of the last treatment.

Although their findings appear to be somewhat at variance with other reports in the the literature, Shapiro, Campbell, Harris, and Dewsberry (1958) reported that ECT did not cause an increase and, in fact, probably caused a relative decrease in psychomotor speed. Nor did it reduce the so-called "distraction effect" in which depressed patients doing a paper and pencil maze task speed up their performance when asked to count aloud at the same time.

More Recent Psychometric Studies of Nonmemory-Associated Cognitive Effects of ECT

McAndrew, Berkley, and Matthews (1967), on the basis of a battery of neuropsychological tests sensitive to specific right and left lateralized hemispheric functions as well as some sensitive to diffuse organic impairment without lateralization, given before and after six right or left unilateral or bilateral ECTs, found no statistically significant differences between or within groups. They did find an interesting trend for right unilateral ECT to lead to more frequent improvement on right than left hemisphere tests, for left unilateral to do just the reverse, and for bilateral to lead to identical percentages of improvement on both right and left hemisphere tests. The Halstead categories test, which is sensitive to diffuse cerebral dysfunction, showed identical percentages of improvement (75%) and worsening (25%) among the three treatment groups. In all three groups, after the sixth treatment there was evidence of some transient cerebral dysfunction. These findings suggest that, on the whole, ECT improves nonmemory cognitive function, though it may in some cases and at certain points in the treatment course induce variable degrees of transient diffuse cerebral dysfunction.

Small et al. (1972) tested ECT patients who had been randomly assigned to unilateral nondominant or unilateral dominant ECT with a battery of neuropsychological tests, modified from the Halstead-Reitan and Wechsler test batteries, before ECT, after five treatments, and 60 to 90 days after the last treatment. They found that after five unilateral nondominant treatments several Halstead-Reitan subtests (mainly right-sided) were improved. Five unilateral dominant ECTs did not result in Halstead-Reitan subtest improvement but did result in impaired Story Memory A performance. At followup 60 to 90 days later, the unilateral nondominant group showed sustained improvement, while the unilateral dominant group now had comparable improvement with clearing of the impairment in Story Memory A.

In a related study (Small et al., 1973), it was found that unilateral dominant, unilateral nondominant, and bilateral ECT were all associated with improvement in nonverbal, visuospatial, nonmemory-related performance tasks and with temporary deterioration on tests requiring intact verbal function. Halstead-Reitan subtests that did change in this study were predominantly in the direction of improvement and were equally distributed among test items reflecting dominant, nondominant, and bilateral hemispheric function.

Reichert, Benjamin, Neufeldt, and Marjerrison (1976) reported that bilateral but not unilateral nondominant ECT produced impairments in "prograde effects" as reflected by decreased performance on the Quick Test, a test of general verbal cognitive processes and performance. These "prograde effects" included motivational, attentional, perceptual, and performance dimensions and therefore play an important role in facilitating information acquisition and storage, but not in mediating recall functions.

Kronfol et al. (1978) studied 18 depressed patients before and during ECT with a battery of neuropsychological tests capable of differentially assessing verbal and nonverbal cognitive functions. Prior to ECT, they found that 5 of the verbal and 13 of the nonverbal subtests were within the impaired range, and interpreted these findings as indicating that depression interferes with both verbal and nonverbal cognitive function but more so with respect to the latter. The posttreatment cognitive testing results, though actually involving relatively small and, for the most part, not statistically significant changes, was interpreted by the authors as indicating that left hemisphere functions declined following left-sided ECT while right hemispheric functions tended to improve after right-sided ECT. They noted disruption of both verbal and nonverbal cognitive tests after one unilateral dominant or nondominant ECT with the degree of verbal impairment being more significant. They interpreted the results obtained after the eighth ECT as reflecting the interaction of two factors, the disruptive effect of ECT in conjunction with the enhancing effect of relief from depression on cognitive processes. Their general conclusion was that ECT did not impair brain functioning but rather brought about significant improvement in nonmemory-related cognitive function as well as in depression.

Consistent with this is the finding of Miller et al. (1981) that the Halstead-Reitan impairment index and verbal, performance, and full-scale IQ scores obtained 2 weeks after a course of ECT are improved when they are compared to those obtained beforehand. As might be expected, the degree of improvement was greater with unilateral than bilateral ECT.

MacKenzie, Price, Tucker, and Culver (1982) compared the daily performance of patients receiving bilateral sinusoidal ECT with that of psychiatric inpatient controls not treated with ECT on a battery of four neuropsychological tests over the first 8 to 12 days of a course of bilateral ECT during which time a mean of 3.1 ECTs had been administered. Both groups improved on all the tests given, but the rate of improvement in the ECT patients was significantly less after three treatments had been given than that in the controls for the Letter Cancellation Test, though not for the others. On the basis of their findings, the authors suggested that some of the earliest effects of bifrontotemporal ECT may be impairment in attentional processes and the capacity to make appropriate shifts in behavioral set, functions thought to be mediated primarily by the frontal lobes (Mattes, 1980; Silverstein, Morrison, & Weinberg, 1980).

Goldstein et al. (1977) found on Halstead-Reitan testing in a small group of psychotically depressed patients evidence of diffuse, generalized, as well as localized right hemispheric dysfunction which was more prominent in patients with a prior history of ECT. There was neither systematic improvment nor worsening in the Halstead-Reitan battery after a course of either brief-pulse or sinusoidal ECT (it is unclear from the study whether the ECT was unilateral or bilateral). However, evidence of right hemisphere dysfunction had increased immediately after treatment and was even more pronounced at 3-month followup. The evidence of generalized, diffuse dysfunction was still present but decreased at 3 months post-ECT. A somewhat similar study done previously by Kendall, Mills, and Thale (1956) had also found no difference between pulse and sine wave stimulation in their effects on cognitive functions.

Horan, Ashton, and Minto (1980) studied depressed patients after three right unilateral ECTs with a battery of tests which tapped four general areas of cerebral functioning including verbal, memory, visuospatial, and visuomotor. The main findings were that the Knox Cube Imitation Test performance was improved, whereas other tests in the battery were not. The authors interpreted this finding as suggesting that the left hemisphere is specialized for processing sequential, time-dependent information. Further, they pointed out that unilateral ECT may be a powerful tool for investigating differential hemisphere functioning in cognitive areas other than memory, a research area that has been relatively little explored thus far.

Short- and Long-Term Followup Studies of the Effect of ECT on Nonmemory-Associated Cognitive Function

While relatively few studies have examined the long-term natural history of ECT-induced cognitive dysfunction, a variety of studies, some of which have been previously discussed, have examined the evolution of cognitive dysfunction over relatively short periods of time, i.e., 2 to 3 weeks at most, following ECT. The following are a few selected longer-term followup studies.

Goldman, Gomer, and Templer (1972) compared the results of Bender-Gestalt and Benton tests in 20 male schizophrenics who had received more than 50 ECT (50-219 with a median of 69.5) between 10 and 15 years previously, with matched schizophrenic controls without a history of ECT. They found a higher error rate in the ECT-treated patients and interpreted this as indicating organicity or permanent brain damage secondary to ECT. In view of the lack of control for severity of illness and the use of uncertain diagnostic criteria in this study, this conclusion must be viewed with caution.

Templer, Ruff, and Armstrong (1973) replicated the preceding study controlling for degree of psychosis and found that schizophrenics who had received more than 50 (median 58.5) ECTs at least 7 years before did not differ in WAIS and Benton scores but did have lower Bender-Gestalt scores than schizophrenic controls without a history of treatment with ECT. They interpreted their finding as being consistent with permanent brain dysfunction due to ECT.

Weeks, Freeman, and Kendell (1980) compared the results of a battery of 19 different memory and nonmemory tests administered to depressed patients before, 1 week, 4 months, and 7 months after unilateral nondominant or bilateral ECT to results obtained from non-ECT patient controls as well as normal controls. At 1 week posttreatment, ECT-treated patients did not perform worse on any of the cognitive tests and, in fact, improved significantly on several of them. At 4-month followup, the scores on cognitive tests in the ECT and non-ECT patient groups were virtually identical. At 7-month followup, the same was true except that there was a tendency for both patient groups to have slightly more impaired scores than the normal control groups. When the unilateral and bilateral ECT patients were compared, it was found that the former were significantly less impaired on cognitive testing than the latter at 1 week post-ECT and, in fact, were scoring close to the normal controls on many of the tests. However, at 4 months post-ECT there was no difference between the two ECT groups. The authors conclude that, in general, ECT does not cause lasting cognitive impairment and that with unilateral nondominant ECT there is very little impairment even in the short-term.

Freeman, Weeks, and Kendell (1980) reported that patients who had had ECT in the past, a mean of 10 years previously, and who still complained of cognitive dysfunction secondary to ECT, performed for the most part as well as normal controls on a variety of nonmemory cognitive tests. On the basis of these results, the authors concluded that ECT usually does not produce enduring ill effects on nonmemory-dependent cognitive function.

Summary

Based on this review, several conclusions emerge.

1. ECT causes immediate posttreatment confusion, which may be cumulative over a course of treatment; this posttreatment confusion is considerably less severe with unilateral than with bilateral treatment.
2. ECT does not cause lasting or permanent dysfunction in nonmemory-associated cognitive functions; though there may be initially or at some other point during the course of treatment, transient, reversible evidence of impairment.
3. If such transient impairments do occur, most studies suggest they will have cleared completely by between 2 and 8

weeks after the treatment course is completed.

4. A few studies raise the question of whether or not bilateral ECT may cause some long-lasting cognitive impairments in schizophrenic patients.
5. Overall, ECT improves nonmemory-associated cognitive functions compared to pretreatment baseline scores.
6. In general, effective treatment with ECT seems to improve nonmemory-associated cognitive dysfunctions associated with depression.
7. Unilateral nondominant ECT appears to improve specific right-sided neuropsychological dysfunction associated with depression, whereas unilateral dominant ECT may impair some left-sided neuropsychological funtion.
8. Acute organic mental syndromes are known to occur in up to 40-50% of patients receiving bilateral ECT; whether or not, and how frequently these may occur with unilateral nondominant treatment is not clear.
9. Certain drugs such as lithium and highly anticholinergic psychotropes such as amitriptyline or benztropine may, when given concurrently with ECT, increase the incidence of acute organic mental syndromes associated with it.

Questions for Future Research

Since the whole area of the effects of ECT on nonmemory-associated cognitive function is virtually in its infancy, a broad array of important research questions for the future exists. For example, will the fascinating early findings in regard to specific lateralized cognitive effects of right and left unilateral ECT hold up in future, well-controlled, prospective replicative studies? In this vein, will ECT turn out, as some suspect it may, to be a useful research tool in investigating the lateralization of cerebral hemispheric functions?

Could careful investigation of the relationship between stimulus and seizure variables and ECT-induced cognitive impairment allow for the development of treatment protocols which in terms of stimulus parameters and treatment schedules could optimize treatment efficacy while further minimizing the occurrence, however transient, of cognitive disturbances? Specifically, if, as seems possible, changes in attentional function are among the earliest to occur after bilateral ECT and if, as also seems possible, they occur early on a continuum with more diffuse and flagrant later organic mental symptoms, might it be possible by monitoring them to identify patients at high risk of developing acute organic mental syndrome and, on the basis of these findings, appropriately adjust the number, type, and/or frequency of treatments given.

Will careful future investigation of the beneficial effects of ECT on certain specific cognitive dysfunctions in depression perhaps shed further light on their etiology or perhaps on the basis for some of the therapeutic effects of ECT?

Other important questions include the following. How frequently do acute organic mental syndromes occur after unilateral nondominant ECT and how might their clinical manifestations differ from those that occur after bilateral ECT? If interference with frontal-lobe attentional mechanisms is the basis for at least some portion of the post-ECT acute organic mental syndrome, might there perhaps be some pharmacological means of preventing this, such as with Ritalin or Pemoline?

Nonmemory Higher Cognitive Function and Electroconvulsive Treatment

Sheri A. Berenbaum, Ph.D.,[1] and
Michael Alan Taylor, M.D.[1]

The short-term effects of electroconvulsive therapy (ECT) upon mnestic function are well known. Bilateral ECT results in both retrograde and anterograde amnesia, with both verbal and nonverbal memory adversely affected. The effect is significantly smaller but not insubstantial following unilateral ECT. The degree of deficit is not correlated with clinical improvement of depression, and significant recovery of mnestic function occurs within 1 to 2 weeks after completion of treatment. By 6 months posttreatment, recovery is virtually complete, although some deficit remains for recall of events during the treatment period (Fink, 1979; Harper & Wiens, 1975; Fink, 1977; Squire, 1977; Squire & Chace, 1975). The effects of ECT upon other higher cortical and subcortical functions are less clearly understood, although results from early and more recent studies suggest little if any permanent disability.

---

Further study is essential, as careful evaluation of cognitive changes associated with ECT has practical and theoretical importance. Treatment decisions clearly necessitate consideration of potential side effects associated with ECT, and delineation of cognitive performance before and after ECT may help to explain possible mechanisms accounting for treatment efficacy, the nature of the dysfunction in depressive illness and, in general, may provide information on brain-behavior relationships. Realization of these goals, however, requires that studies be designed and evaluated with respect to several important issues.

Methodological and Theoretical Considerations

Subject Sample Characteristics

To properly evaluate the cognitive effects of ECT, patient selection must be precise, as there is evidence (Taylor, Redfield, & Abrams, 1981; Abrams, Redfield, & Taylor, 1981) that there are differing patterns of cognitive deficits between the major psychiatric disorders. Nevertheless, several studies use heterogeneous patient groups and include schizophrenics (Horan, Ashton, & Minto, 1980; Small, I.F., Small, J.G., Milstein, & Moore, 1972) who have significant cortical dysfunction (Abrams et al., 1981; Taylor et al., 1981). Diagnostic problems extend to difficulty in evaluating and controlling for severity of psychopathology: Matching groups by depression score alone is inappropriate and should include for comparison other symptoms that form the constellation of the depressive illness so that nonendogenous patients are separately evaluated or excluded from study (Taylor, 1982a). Subject demographic variables (e.g., age, sex, education) are usually controlled, but other important and confounding variables (e.g., medication, previous ECT) often are ignored (Horan, Ashton, & Minto, 1980; Kronofol, Hamsher, Digre, & Waziri, 1978; McAndrew, Berkley, & Matthews, 1967).

Further, evaluation of cognitive effects of ECT is confounded by patients' premorbid ability levels. Cognitive level has been examined only in the immediate pre-ECT period, when the nature of the psychiatric illness itself is likely to impair performance. Lack of change or improvement in cognitive performance after ECT could be due to either a lack of serious neuropsychological effects of ECT, or ECT-induced cognitive impairment associated with cortical dysfunction which is counteracted by improved performance resulting from elevated mood. Educational attainment can be evaluated as an approximate index of premorbid intelligence. Examination of earlier records and/or assessment of vocabulary are more exact.

Cognitive Testing

In evaluating cognitive effects of ECT, it is essential to specify the testing schedule, since effects appear to vary with the number of treatments and the time period between the ECT and the assessment, both for a given ECT and after a course of treatments.

In selecting tests to assess cognitive change, the following standard design features and psychometric criteria should be satisfied: a) acceptable reliability and validity; b) normative data available or easily collectable; c) appropriateness for use with psychiatric patients, as evidenced by previous use with younger subjects, neurological, or other psychiatric samples; d) standardized instructions and procedures to ensure uniformity of administration within and across centers; e) objective scoring procedures; f) reasonable time limits, to allow assessment of multiple abilities within one test session without compromising reliability; and g) appropriateness for repeated testing, so that practice and fatigue effects are minimized, and state-dependent learning factors do not confound the results.

Attempts to relate cognitive changes to neurological function or to etiological theories of depressive illness require that the tests used meet the following specific theoretical criteria: a) established or suggested sensitivity to neurological disruption, i.e., that there be data on changes with localized or lateralized damage; b) ability to tap "higher order" cognitive functions of the type reputed to be disrupted with ECT or drugs; c) minimal involvement of short-term memory, to minimize performance changes due to memory disruption and maximize ability to see true "cognitive" changes; and d) ability to examine constituent components of complex cognitive functions, i.e., to attribute cognitive changes to specific aspects of processing, or to statistically control the influence of simpler functions on performance on more complex tasks.

Ultimately, it is desirable to determine the nature of the cognitive disruption(s) or improvement(s), i.e., to what extent the processes affected are specifically attention/concentration, speed, perceptual-motor ability, reasoning, synthesis, planning, disorientation, or general cognitive deficit, and tests should be administered that provide such information.

Data Analysis

Studies evaluating effects on a number of correlated tasks with several groups each of small size are plagued by statistical difficulties of high Type I error, nonindependence of comparisons and low power. These problems can be attentuated by using matching procedures and associated statistics, and multivariate analysis (Timm, 1975). Difficulties with matching on pre-ECT cognitive level can be handled with analysis of covariance designs (Cohen & Cohen, 1975).

Some studies (e.g., Kronofol et al., 1978) contain implicit or explicit statements concerning the relationship between cognitive changes and clinical efficacy of ECT, i.e., cognitive improvement is directly associated with relief from depression. In no study has this been adequately tested by correlating cognitive performance with clinical course.

Review of Results Reported

The literature on the adverse effects of ECT most frequently reports transient neuropsychological deficits that occur during the first 30 minutes post-ECT. These include dysphasia after unilateral dominant ECT (Clyma, 1975), and tactile and visual inattentions (Kriss, Blumhardt, Halliday, & Pratt, 1978) and construction dyspraxia following unilateral nondominant ECT. Until recently, most studies have had serious methodological limitations and have examined neurological and perceptual functions, rather than higher order cognitive abilities.

The recent studies reporting more extensive testing of long-term cognitive function have better methodological controls than the older studies, but are still far from optimal. It is possible, however, to evaluate these recent reports in light of the complexities discussed above. The results are confusing and often contradictory, but some tentative findings emerge, along with testable explanations for the discrepancies. In general, the data suggest that little, if any, permanent disability occurs as a result of ECT, and that the treatment may actually improve at least some aspects of cognition, possibly as a result of relief of depression. These conclusions emerge from six relatively large studies attempting to provide methodological controls and using extensive neuropsychological testing. All of these studies, however, are limited by one or another difficulty cited above, including diagnostic problems, varying ECT course and testing schedule, pre-ECT cognitive deficits, small sample size, inadequate test battery, and incomplete data analysis.

McAndrew et al. (1967) compared cognitive consequences of courses of six unilateral right, unilateral left, or bilateral ECT treatments in a group of patients containing mostly depressives. Their results revealed no significant interaction effects, "indicating that pre- and post-ECT test score differences on measures shown to bear a relationship to right as opposed to left cerebral hemisphere dysfunction did not vary as a function of unilateral right, unilateral left, or bilateral electrode placement." The authors interpreted the trends, which were weak at best, as indicating that right ECT was associated more frequently with improvement and less frequently with decrement on right as compared with left hemisphere tasks, while left ECT was associated more frequently with improvement and less frequently with decrement on left vs. right hemisphere tasks. Post-ECT performance improved on several tests and declined on others, with no apparent pattern. Interestingly, performance on the Halstead Category Test, in part a measure of concept formation, improved post-ECT in all three groups, perhaps as a result of mood elevation. Surprisingly, there were no differences in cognitive change between unilateral and bilateral ECT groups.

Small et al. (1972, 1973) examined cognitive effects of different kinds of somatic treatment, including unilateral left and right and bilateral ECT. A heterogeneous group of patients was tested on a neuropsychological test battery immediately after a treatment of five ECTs, and then again 60-90 days later. Although important details of the methods and results are omitted from the reports, in general it appears that right ECT was associated with immediate unchanged or improved function, and left ECT was associated with impairment in story memory. Testing at 60-90 days revealed that improvements were sustained and the deficit in the left ECT group eliminated. Performance on the Rod and Frame Test of field dependence was assessed in some patients; mean number of errors was unchanged after ECT. However, analysis of responses with respect to direction of rod displacement indicated that the majority of errors occurred on the side contralateral to stimulation.

Kronofol et al. (1978) examined the effects of differing amounts of left and right unilateral ECT in depressed patients. Their data indicated that the small deficits seen after the first ECT were mostly eliminated by the eighth ECT, with the possible exception of verbal fluency, a left frontal function (Benton, 1968; Milner, 1967). The authors stated that, "Neuropsychological tests showed that the right hemispheric functions were more frequently abnormal as compared to left hemispheric (dominant) functions in the pre-ECT tests. ECTs delivered to either the right or left side improved right hemispheric functions when the depression was ameliorated . . . in depression right hemispheric functions are initally disturbed and ECT, instead of being deleterious to these functions, tends to improve them." These interpretations, however, are difficult to defend: only one (of eight) of the increases in right hemisphere performance was significant; normative data were not reported, so there is no way to assess the abnormality of right hemispheric functions pre-ECT; correlations between cognitive improvement and depression amelioration were not reported; depression was relieved with both left and right ECT, whereas no right hemisphere cognitive function was significantly improved with left ECT (and one left hemisphere ability was significantly impaired); differences between left and right ECT groups on some pre-ECT cognitive measures and depression score were not tested statistically; direct comparisons were not made between right and left unilateral ECT groups.

Horan et al. (1980) compared unilateral right and bilateral ECT in two heterogeneous patient samples; testing was conducted 6 to 8 hours after the last of a series of three ECTs. In both samples, performance on the Knox Cube Imitation Test (a sequential, presumably left hemisphere task) was significantly improved. In the one sample where other tests were administered, Vocabulary was impaired in the bilateral group and Form Assembly was impaired in both the unilateral and bilateral groups. The authors suggested that since improvement was specific to the sequencing test, it did not reflect change due to relief from depression, but rather the facilitation or enhancement of left hemisphere sequencing operations with the partial suppression of the right hemisphere accomplished with ECT. Although this explanation fits the data for both left and right hemisphere tasks, it is incompatible with data from their own and other studies showing unchanged or improved performance on some right hemisphere tasks (Kronofol et al., 1978; Small et al., 1972) or failing to show improvement on some sequencing tasks (Kronofol et al., 1978) after right ECT.

Weeks, Freeman, and Kendell (1980) examined prolonged effects (up to 6 months post-ECT) of nondominant unilateral and bilateral ECT in depressed patients. In general, the results indicated no deficits and some improvement with unilateral nondominant ECT at both 1 week post-ECT and later, and small immediate deficits with bilateral ECT that, with the possible exception of memory, cleared up by 6 months post-ECT. Details of these results are difficult to interpret, since pre-post ECT comparisons are made only for the 1-week assessment. At later assessments, both ECT groups are compared to non-ECT and normal controls. Examination of the data provided indicates that in the unilateral group, both psychomotor speed and cube analysis performance showed significant improvement at 1 week, and performance on a test of short-term attention and concentration was at normal levels by 4 months.

On scales of depression, both ECT and non-ECT groups improved significantly, suggesting that the similar cognitive performance of the groups was due in part to relief from depression. This finding is surprising, since there were no significant differences between groups in amount of medication taken at any stage, raising the possibility that the non-ECT group consisted of more reactive depressives who get well over time without treatment (Taylor, 1982b), an interpretation supported by the significantly greater impairment of the ECT group (as compared to the non-ECT group) on pretreatment cognitive performance.

In a related but less extensive study examining cognitive functioning and ECT, Cohen, Berent, and Silverman (1973) administered the Rod and Frame Test to a group of depressed patients pre-ECT and 5 hours after a single unilateral left, right, or no ECT. Performance was enhanced following right ECT and impaired following left ECT, with no change in the control group. These results led the authors to speculate about "two cognitive controls of attention deployment." The scanning control, related to extensiveness of sampling stimuli, was suggested to be mediated by structures of the right hemisphere. In contrast, the field articulation control—the sorting-out of elements of the field—was proposed to be related to left hemisphere structures.

The studies reviewed above differ in a number of methodological and theoretical variables, several of which could account for the differing conclusions. These include patient sample, sample size, number of ECT treatments, time between ECT and testing, pre-ECT cognitive performance, nature of control group, tests administered, analyses performed, and interpretation of results.

Time Course

The three studies examining the time course of ECT (Kronofol et al., 1978; Small et al., 1972; Weeks et al., 1980) address two separate issues: Effects of differing numbers of ECT, and effects of time since last ECT. The results of Kronofol et al. (1978) indicated that deficits which appear after a single ECT treatment may clear up after a course of eight ECTs. This suggests that the deficit seen by Cohen et al. (1973) on the Rod and Frame Test might disappear with continued ECT treatment, and that the changes seen by Horan et al. (1980) after three ECTs might not persist with additional treatment.

Two studies (Small et al., 1972; Weeks et al., 1980) examined changes in cognition as a function of time after last ECT. The results of Weeks et al. (1980) suggest that cognitive functioning improves with time from ECT, so that small deficits present at 1 week post-bilateral ECT are gone 6 months post-ECT, and improvements seen at 1 week post-unilateral nondominant ECT may actually increase later. Similar results are reported by Small et al. (1972) for testing done immediately following ECT and 60-90 days later. It is likely that there is an endpoint to this recovery and maintenance of cognitive function in at least some patients due to onset of another depressive episode with associated cognitive impairment. Except for the studies of Small and colleagues (1972, 1973), there are no investigations which separate out the changes due to relief of depression from effects specific to ECT. Small et al.'s (1972, 1973) studies are difficult to interpret, however, because of confounds between treatment and clinical variables, and unclear methodological procedures.

The period between ECT and test session is an important time course variable not studied. Of the studies reviewed, tests were administered either between 5 and 8 hours post-ECT (Horan et al., 1980; Kronofol et al., 1978), at 24 hours (Small et al., 1972; Small et al., 1973), "within 48 hours" (McAndrew et al., 1967), or at least a week after ECT (Weeks et al., 1980). Some studies of perceptual and cognitive functioning and neurological effects post-ECT report transient deficits that disappear after 30 minutes (Clyma, 1975; Kriss et al., 1978). It is possible, however, that the recovery curve differs for different functions, particularly higher-order cognitive abilities, and perhaps for the left vs. right cerebral hemispheres.

Electrode Placement

There is surprisingly little support for differential cognitive effects by site of electrode placement, except for a tendency for faster recovery (Small et al., 1972; Weeks et al., 1980) and perhaps improved performance (Cohen et al., 1973; Kronofol et al., 1978; Small et al., 1972) from unilateral nondominant ECT. Unfortunately, sample sizes are often too small to see even moderate effects, groups often differ on pretreatment variables, and direct comparisons between groups are rarely made.

In the only study (McAndrew et al., 1967) in which the effects of all three electrode placements were compared on right and left hemisphere tests, there were no significant interactions between pre-post task performance and electrode placement. Conclusions arguing against differential effects, however, need to be considered in light of the small sample size and insufficient power to see effects.

Pre-ECT Cognition

In those studies (McAndrew et al., 1967; Weeks et al., 1980) where abnormality of pre-ECT cognitive functioning can be assessed, scores are found to be low, consistent with reports of impaired cognition in untreated depressed patients (Goldstein, Filskov, Weaver, & Ives, 1977; Wexler, 1980). Additional difficulties in interpreting pre-post differences are due to pre-ECT cognitive differences between ECT groups (Kronofol et al., 1978; McAndrew et al., 1967) or between ECT groups and controls (Weeks et al., 1980). In order to attribute cognitive changes to ECT treatment, it is crucial to consider pre-ECT levels and to have appropriate control groups, which should consist of non-ECT treated depressed patients matched on demographic, illness, and cognitive variables.

Cognitive Tests

Most studies (Horan et al., 1980; Kronofol et al., 1978; McAndrew et al., 1967; Small et al., 1972) claim to use tests that measure right and left hemisphere function and/or general cerebral dysfunction. Unfortunately, the appropriate reliability and validity data are not always provided or even known. Thus, failure to find effects or unreliability of effects reported (including inability to replicate results) may be a function of the measuring instruments rather than ECT effects. For example, Kronofol et al.'s (1978) finding of post-ECT improvement on one right hemisphere test and no change on other putative right hemisphere tests may be due to test unreliability or to different aspects of hemisphere function measured by each test.

Furthermore, studies have rarely used tests which can identify the nature of the possible cognitive changes, or separate component processes of a task. It is possible, for example, that part of the cognitive impairment seen pre-ECT is due to inattention and/or psychomotor retardation associated with depression. If these deficits are eliminated when mood is elevated, then tasks requiring attention and/or speed would show greater improvement post-ECT. The influence of attention and speed would create further problems in interpreting pre-post ECT effects if right and left hemisphere tasks differentially required these abilities. Thus, complete analysis of the cognitive effects of ECT would include evaluation of attention and psychomotor speed, and statistical analysis of the influence of these variables on performance on other tasks.

One of the most problematic areas of neuropsychological assessment and an area rarely examined in ECT studies is frontal lobe function. The frontal lobes have been implicated in planning, organization, ability to categorize and shift mental set, concept formation, creativity and, in general, in higher order cognitive activities (Hecaen & Albert, 1978; Luria, 1973; Warren & Akert, 1964). It is crucial to assess the influence of ECT on these functions, since they are related to important everyday activities. Persistent patient complaints despite empirical failures to find ECT-induced impairment suggest that it is these higher order frontal lobe functions that may be adversely affected by ECT. Interestingly, one of the largest and most stable deficits resulting from ECT is verbal fluency (Kronofol et al., 1978), an ability shown to be subserved by the left frontal lobe (Benton, 1968; Milner, 1967).

Study Proposals

The inconclusive evidence of cognitive effects of ECT discussed above suggests that further studies be conducted that incorporate changes in study design to allow for more definitive results. Our analysis of the literature, and methodological and theoretical concerns, leads to the following suggested guidelines for designing such studies.

Subject Sample

To attribute pre-post ECT cognitive changes to the treatment, it is crucial to control for the effects of the depressive illness, preferably by matching the ECT group on demographic, illness, and cognitive variables to another group of depressive patients receiving alternative treatment or no treatment. Attempts should be made, where possible, to restrict the sample to endogenous depressives.

Testing Schedule

Since cognitive effects of ECT appear to vary with number of treatments (Kronofol et al., 1978) and time between treatment and assessment (Small et al., 1972; Weeks et al., 1980), it is desirable to test patients before ECT, after one ECT treatment, immediately after a course of six to eight treatments, and longitudinally (perhaps through a period of maintenance) for several months.

Test Battery

The suggested test battery takes approximately 3 hours to administer and is designed specifically to measure potential long-term adverse effects of ECT on higher cognitive function. The tests chosen satisfy the technical criteria specified earlier, and derive from extensive literature on ability testing in normal populations (e.g., Ekstrom, French, and Harman, 1976; Hakstian & Cattell, 1976; Wilson, DeFries, McClearn, & Vandenberg, 1975), and assessment of cognitive changes in clinical neurological populations (e.g., Benton, 1968; Hecaen & Albert, 1978; Jones-Gotman & Milner, 1977; Luria, 1973; Milner, 1963; Milner, 1967; Newcombe, 1969; Rosvold, Mirsky, Sarason, et al., 1956; Teuber & Weinstein, 1956; Warren & Akert, 1964; Warrington & James, 1967) and in drug-treated groups (Harshman, Crawford, & Hecht, 1976; Müller-Oërlinghausen, Bauer, Girke, Kanowski, Gonçalves, 1977). The battery also meets the theoretical concerns expressed earlier and has the capacity to provide closure on unresolved issues of ECT-induced cognitive effects. In particular, tests were selected to allow examination of the influence of attention and psychomotor speed on other cognitive functions, to see differential localization/lateralization effects, and to tap more extensively frontal lobe function.

The Table displays the individual tests recommended, and some relevant technical and theoretical information, including cognitive function measured, reliability and validity, and suggested neurological involvement or drug effect. Further details may be obtained in the references cited, or from the authors.

Conclusions

Although available data suggest that ECT does not result in long-term non-mnestic cognitive disruption, qualifications about possible adverse effects are necessary due to incomplete assessment and inadequate methodological and theoretical controls of past studies. Investigations designed according to guidelines suggested above should help delineate whatever effects may be present.

In particular, the following general set of questions may be answered: What is the nature and extent of the adverse non-mnestic cognitive effects of ECT, and are they prolonged, related to number of treatments, electrode placement, clinical course or the pathophysiology of depressive illness? Should adverse non-mnestic cognitive effects occur, what do these effects indicate about neurological correlates of cognitive functioning, and the mechanisms by which these functions may be affected by depressive illness and somatic therapy?

Table

Suggested Cognitive Battery

Test	Ability Measured	Reliability	Suggested Neurological or Drug Effects
Timed Sentence Writing	Motor speed		
Number Comparison Test	Perceptual speed	.70 - .82	↓ with lithium
Continuous Performance Test	Attention	.74 - .90	↓ with brain damage (various types)
Wisconsin Card Sorting Test	Abstract categorization and ability to change set		Frontal lobe
Analogies	New concept formation		
Logical Inference Test	Logical verbal reasoning	.57 - .78	Left hemisphere; ↓ with marijuana
Reading Comprehension Test	Reading comprehension		Left hemisphere; Some minimal ability in right hemisphere
Originality	Creativity	.74	Frontal lobe for fluency aspect
Word Beginnings and Endings Test	Word fluency	.68 - .71	Left hemisphere especially left frontal
Thing Categories Test	Ideational fluency	.59 - .74	Left hemisphere; Interaction of left and right hemispheres
Design Fluency	Figural fluency		Right frontal, right frontocentral
Gollin Figures	Speed of closure		Right hemisphere temporal or parietal; ↑ with marijuana
Embedded Figures Test	Disembedding		Left and right hemisphere, especially left Similar test — ↓ with left ECT, ↑ with right ECT
Copying a Geometric Figure	Constructional ability		Right parietal
Finger Tapping	Fine motor regulation		Contralateral premotor frontal

Convulsive Therapy: A Risk-Benefit Analysis

Max Fink, M.D.[1]

Since its development in 1934, convulsive therapy has been a center of controversy. It has been applied in many conditions, both in the mentally ill and in patients with physical disorders. The reports vary from anecdotal testimonials and acrimonious diatribes on the one hand, to cautious, well-controlled, independent assessments on the other. To the welter of data, two additional factors emerge to make an assessment difficult—the fluctuating history of enthusiasm and disparagement, and changes in the technique and instrumentation of the treatment. Much of the controversy is highlighted and extensively reviewed in recent publications (Kiloh, 1977; APA, 1978; Fink, 1979; Breggin, 1979; Palmer, 1981; Kendell, 1981).

While convulsive therapy has salutary effects in a variety of conditions, the effects in severe depression are the best documented and are the basis for its continued clinical use. In evaluating the treatment, one is inclined to use the data from the 50-year history of the therapy, despite an awareness that treatments administered in the first decades differed significantly from present practice. But present practice also varies, for as new developments are tested, they are accepted at a varying rate. The introduction of unilateral electrode placement about 1961 showed that complaints of amnesia could be sharply reduced, but doubts as to the efficacy of these modifications are the basis for the continuing controversy. The introduction of succinylcholine in 1953 soon became part of standard academic practice, but its use is still controversial among practitioners who administer the treatments in outpatient settings or patient's homes. The present assessment of efficacy and risks is based on the data of the past two decades, with an emphasis on the use of electroconvulsive therapy (ECT) in the treatment of melancholia, with due regard for the most widely accepted practice as to safety and a reduction of unpleasant sequellae.

This review assumes ideal conditions as to selection of cases, administration of treatments, monitoring of side effects, and the training of the therapists. The wide latitude in experience in ECT (and even in the alternate therapies) is surely a principal factor in the outcome of a therapeutic trial, particularly one as complex as convulsive therapy. From a practical point of view, this assessment may be idealized, and may be true only for those patients who are fortunate to be treated by therapists who maintain a sufficient interest in this therapy to maintain their skills for optimal performance.

Efficacy

Convulsive therapy rapidly and efficiently relieves the symptoms of melancholia, regardless of type or duration. It is as effective, and often more so, than pharmacotherapy, and is clearly superior to other therapies in these conditions. The reduction in mortality is a particularly compelling observation, making the risk of suicide an important indication for ECT (Kiloh, 1977; APA, 1978; Fink, 1978a, 1979; Avery & Lubrano, 1979; Kendell, 1981).

Many patients with endogenous depression fail to respond to tricyclic antidepressant drugs, even under the optimized conditions of blood level monitoring for adequacy of dosing. Yet, many of these respond rapidly to ECT. These patients are usually described as being depressed psychotic patients with delusions (Hordern, Holt, Burt, & Gordon, 1963; Glassman, Kantor, & Shostak, 1975; Avery & Winokur, 1977; Davidson, McLeod, Kurland, & White, 1977; Kantor & Glassman, 1977; Nelson & Bowers, 1978; Minter & Mandel, 1979 a,b; Kaskey, Nasr, & Meltzer, 1980; Charney & Nelson 1981). The diagnosis of psychotic depression provides a second compelling indication for the use of ECT.

Catatonia is a syndrome that is particularly responsive to ECT. While it is often classified as a subtype of schizophrenia, it is also a feature of severe infectious diseases and manic-depressive psychosis (Abrams & Taylor, 1976; Taylor & Abrams, 1977; Abrams, Taylor, & Stolurow, 1978). Catatonic patients may also exhibit dysregulation of cortisol metabolism in a fashion that is characteristic of some subtypes of depressive psychosis (Dysken et al., 1979; Greden & Carroll, 1979). With ECT, this dysregulation rapidly normalizes as the clinical condition improves, suggesting an intimate connection in pathophysiology betweeen the ECT responsive forms of depressive psychosis and catatonia (Fink, 1981).

[1] Department of Psychiatry and Behavioral Science, School of Medicine, State University of New York at Stony Brook, Long Island, NY 11794. Supported in part by USPHS Grant MH-35518 to the International Association for Psychiatric Research, Inc., St. James, NY 11780.

ECT was introduced as a treatment for schizophrenia, but the efficacy and ease of administration of the antipsychotic drugs, introduced in the 1950s, led to their preferential use. use. But doubts linger that perhaps ECT was discarded too soon. While recent reviews of the literature find little support for its use in such patients (Fink, 1978 a,b; Salzman, 1980), the published studies comparing ECT and antipsychotic drugs do not meet our present standards, so it is unclear whether there is a defined superiority for the antipsychotic drugs. And, as the reports of the incidence and severity of tardive dyskinesia with the use of psychotropic drugs increase, some clinicians are again asking whether there is a place for ECT in the treatment of schizophrenic patients.

Taylor and Fleminger (1980), in a double-blind trial of ECT in patients with paranoid schizophrenia, compared the results of seizures three times weekly (for 8 to 12 treatments) with those of sham seizures. After six treatments, patients in both the ECT and sham-ECT groups improved, with the change clearly greater in the ECT group. Four weeks later, the control group showed little further change, but the ECT group continued to improve. Only one patient in the ECT group still had a rating of illness, while 9 of 10 controls had scores in the pathological range, demonstrating an efficacy for ECT in paranoid schizophrenic patients who had not responded rapidly to medication. In another study, Ries et al. (1981) describe the successful treatment with ECT of nine schizoaffective patients who had not responded to pharmacologic treatment.

In the first years after the introduction of convulsive therapy, mania was reported to respond favorably, with the number of treatments necessary for recovery to be similar to those needed for depressive states. In succeeding years, the number of treatments needed for a favorable outcome increased until the numbers were equal to those used in the treatment of schizophrenia. The reasons for this change in experience are unclear, but may reflect, perhaps, the introduction of alternate treatments for responsive cases of mania, or a change in clinical typology. Since the introduction of lithium and antipsychotic drugs, the efficacy of ECT in mania has not been examined in a prospective study, although McCabe (1976) and McCabe and Norris (1977) make compelling observations of the efficacy of ECT in retrospective reviews. However, the combined use of lithium and ECT may increase the hazards of an organic mental syndrome (Hoenig & Chaulk, 1977; Remick, 1978; Mandel et al., 1980; Small et al., 1980).

In most other conditions in which ECT has been examined, its efficacy is low. This includes patients with drug addiction, alcoholism, psychopathy, and neuroses. Dotted through the ECT literature, however, there are anecdotal reports of patients with parkinsonism showing marked improvement not only in their symptoms of depression, but also in the motor symptoms (Lebensohn & Jenkins, 1975; Dysken et al., 1976; Asnis, 1977; Yudofsky, 1979; Ananth et al., 1980). Balldin et al. (1980) successfully used ECT in seven bedridden parkinson patients without symptoms of endogenous depression. The patients improved in their motor abilities, sufficient for some to return home. Another recent report finds ECT to lower blood sugar levels among diabetics of recent onset (Fakhri et al., 1980).

On efficacy criteria, ECT is clearly justified in the treatment of patients with endogenous depression, particularly those with delusions or suicidal intent, in those with catatonia, and in some cases of mania, and as a weak alternative in the management of the symptoms of acute schizophrenia.

Safety

The principal risks of convulsive therapy are fracture, organic mental syndrome, missed and tardive seizures, and death. These complications were significant features of the early treatments, particularly those that used pentylenetetrazol for induction. But modern treatment methods, which include anesthesia, oxygenation, and muscle relaxation, reduce the complication rate significantly. Anesthesia and monitoring of the seizures further reduce the incidence of missed and tardive seizures. Thus, for the present methods of induction, two complications remain —death and amnesia.

Under modern conditions of treatment, death may occur with an incidence of 4/100,000 treatments (Royal College of Psychiatrists, 1977; Fink, 1979). More deaths were reported in the early years, when treatment procedures were less well defined (Turek & Hanlon, 1977; Asnis, Fink & Saferstein, 1978; APA, 1978). A principal factor is the risk associated with anesthesia, although the death rate for ECT and its anesthesia is considerably less than that for anesthesia alone (Fink, 1979). A consequence of the relative safety of modern ECT is the paucity of pathologic material, leaving the issue of persistent brain damage unresolved (Fink, 1977, 1979).

The principal risk of modern ECT is amnesia. Every patient who experiences a grand mal convulsion exhibits amnesia for the event, as well as retrograde amnesia. The amnesia persists for varying lengths of time, depending on the age of the subject, location of the electrodes, intensity of the currents, and the number of prior seizures and their frequency (Harper & Wiens, 1975; Fink 1977, 1979; APA, 1978; Fraser & Glass, 1978, 1980; Summers, Robins, & Reich, 1979). But, performance on memory tasks recovers rapidly, so that within 2 weeks of the last treatment, patients perform as well or better than before the treatment (Dornbush & Williams, 1974; Squire, 1977). The principal objection to ECT is the persistence of this syndrome into the recovery period. In an analysis which the author undertook elsewhere, he suggested that the persistence of an organic mental syndrome was no greater than 1/200 cases and may be reduced further by good treatment practice (Fink, 1979).

Complaints of amnesia are usually referred to as the basis for beliefs that persistent brain damage ensues from a course of treatment. Those authors who profess this view with the most energy confuse the data of the early years of treatment, when anesthesia, oxygenation, and modern electrode placements and currents were not used, with our present practice (Friedberg, 1976; Breggin, 1979).

Depressive illness alone, without ECT, is associated with impairment in cognitive functions (Henry, Weingartner, & Murphy, 1973; Sternberg & Jarvik, 1976; Strömgren, 1977). Depressed patients have decrements in short term memory functions, which improve as they recover from their illness with antidepressant drug therapy or ECT.

Even this complaint of amnesia may be significantly reduced by the use of minimal currents and unilateral electrode placements. Amnesia is significantly reduced if the electrodes are placed over the nondominant hemisphere (d'Elia, 1970; d'Elia & Raotma, 1975; Squire & Slater, 1978; Fink, 1979; Strömgren et al., 1980; Kendell, 1981). Further, in the early studies of the selection of currents to induce a seizure, the amnesia was less in treatments which used brief stimulation methods (Liberson, 1953). Interest in the use of these modified currents was recently revived by Valentine, Keddie, and Dunne (1968) and Weaver and his coworkers (1976, 1978, 1979). Ongoing studies by Mandel and by Weiner using such currents suggest that there is indeed a reduction in cognitive defects with their use.

The efficacy of ECT is reflected in the presence of a seizure, and is not dependent on its mode of induction or other characteristics of the convulsion (Ottosson, 1960; d'Elia & Raotma, 1975; Fink, 1979). There has been much recent interest in whether the seizure is indeed necessary, and in four studies which have recently been reported from Great Britain, there is reasonable assurance that improvement is more rapid and more secure with seizures than with sham seizures (Palmer, 1981; Kendell, 1981).

Another complication, more prominent in the past than the present, is that of recurrent spontaneous seizures. The analogy to a kindling phenomenon has stimulated interest in this possibility, but a recent survey of 166 patients who had received more than 2,700 treatments revealed four patients who developed spontaneous fits after a course of ECT, and in only two was it likely to be a proximal cause (Blackwood et al., 1980). In kindling, there is a progressive decrease in the threshold for a seizure, while in ECT, the amount of current needed to induce a seizure generally increases (Green & Costain, 1981). In studies of the kindling phenomenon, anesthesia, particularly the use of barbiturates, is prophylactic for the recurrence of spontaneous seizures. The routine use of anesthesia remains a principal barrier to this complication.

The efficacy of ECT can be sustained without a reduction in therapeutic efficacy and with minimal effects on cognition by proper attention to anesthesia, oxygenation, electrode placement, selection of currents and current dosage, and monitoring. If these observations are put to routine use, then the safety of ECT, particularly with regard to the development of amnesia, will be evaluated more optimistically than at present.

Alternate Treatments

The risks of tricyclic antidepressants are not well defined, although they may be severe. Cardiovascular complications, particularly hypotension and disabling arrhythmias, are recognized with increasing frequency. Death by suicide using tricyclic compounds is frequently reported, although surveys of their incidence are not available. The onset of the therapeutic response is usually delayed, with the standard reference works suggesting that a minimum of 7 to 14 days are required for antidepressant efficacy. In older patients, the anticholinergic effects of tricyclic compounds may be associated with dry mouth and difficulty in urination and in reading (Klein & Davis, 1969; Hartshorn, 1974; Stimmel, 1979).

Avery and Winokur (1976, 1977, 1978) make a strong case for the safety of ECT compared to alternate therapies for depressive psychoses. They find lower suicide death rates in ECT-treated patients. This is also true for the efficacy of ECT in depressed patients with psychotic delusions (Hordern, Holt, Burt, & Gordon, 1963; Glassman, Kantor, & Shostak, 1975; Avery & Winokur, 1977; Davidson, McLeod, Kurland, & White, 1977; Kantor & Glassman, 1977; Nelson & Bowers, 1978; Minter & Mandel, 1979 a,b; Kaskey, Nasr, & Meltzer, 1980; Charney & Nelson, 1981).

The use of monoamine oxidase inhibitors is also restricted by hypertensive crises, cardiovascular and hepatic toxicity, and the interactions of these compounds with foodstuffs, tricyclic antidepressants, and some drugs used in common medical practice (Hartshorn, 1974). Their efficacy is low in depression, although recent studies of their use in neurotic anxiety states are more optimistic.

Comparisons with treatments for other mental illnesses are more difficult. In mania, the efficacy of lithium and the phenothiazines is well defined, but the risks of mortality, blood dyscrasia, organic psychosis, tardive dyskinesia, and other neurologic sequellae must be considered (Klein & Davis, 1969; Gershon & Shopsin, 1975). Lithium therapy has been associated with adverse effects on memory function (Schou, 1968; Kusomo & Vaughan, 1977). In a historical comparison of ECT and lithium, McCabe (1976) found the complications of lithium to be as severe as those for ECT.

In schizophrenia, the complications of ECT depend on the number and frequency of the treatments. Higher dosages are more effective, but the larger number of treatments increases the probability of persistent amnesia and spontaneous seizures. The hazards of antipsychotic drugs are also well defined, particularly tardive dyskinesia, hepatic dysfunction, lenticular opacities, and blood dyscrasia. Despite these hazards, pharmacotherapy seems to have significant advantages over ECT in chronic cases, particularly since maintenance therapy is more easily provided by the drug therapies.

ECT is, at the least, as effective as tricyclic antidepressants, and significantly superior to amine oxidase inhibitors and the various psychotherapies, in the treatment of the severe mentally ill. The latter therapies are particularly hazardous, since death by suicide is an everpresent feature of severe depressive illness.

Consequences of Non-Use of Treatments

Before a nihilistic attitude toward the use of convulsive therapy in the severely mentally ill is adopted, it is useful to consider the natural course of these illnesses before ECT and the drug therapies were introduced. During the 20th century, the number of mental hospital beds escalated until 1955-1960; since then, the number of beds for the hospitalized mentally ill has been sharply reduced. Records of these earlier periods describe many patients with depressive psychoses, mania, and schizophrenia who remained ill for decades. ECT was an important factor in the reduction of hospitalization periods to less than 6 months, and the increase in discharge rates to

80% (Huston & Locher, 1948 a,b), and in the reduction in mortality (Slater, 1951). It is difficult to cite suicide rates, but the recent reports by Avery and Winokur (1976, 1977, 1978), McCabe (1976), and McCabe and Norris (1977), reviewing the data from earlier periods, find greater efficacy, better discharge rates, fewer deaths and suicides, and shorter hospitalizations for patients treated with ECT and/or adequate doses of drugs than alternate treatments, usually milieu and the psychotherapies.

Some recent recollections by therapists who lived through that era of transition reflect on the remarkable effects of their introduction (Post, 1978; Rollin, 1981). A recent report by the scientists at the National Institute of Mental Health Clinical Center cites the successful treatment by ECT of nine cases in 6 years (Paul et al., 1981). There is some discrepancy in attitude when a major educational and research center finds so few cases for this treatment, a treatment which was more successful than a wide range of prior therapies. Similar anti-ECT bias must exist at other centers, particularly those public mental facilities which seem to treat less than 1% of their admissions, while university affiliated centers seem to find up to 5% of admissions to warrant ECT (Asnis, Fink, & Saferstein, 1979). The discrepancy in usage surely reflects political, economic, ideological, and experiential factors, but it does patients little service to be admitted to an institution which has restricted the range of treatments for nonmedical reasons, and to be denied the benefits of an otherwise useful treatment.

Conclusion

The benefits of the use of ECT clearly outweigh the risks and provide a clear indication, above all alternate treatments, for patients with psychotic depression. In these patients, and in those with suicidal risk, ECT is the treatment of choice. This is particularly true for patients with delusions or catatonic features.

A case may be made for the use of ECT in patients with mania and acute schizophrenia, but the indications are less clear, and the usefulness of alternate therapies is sufficiently well defined to warrant their initial use. When the treatment response is delayed, or where compliance for medication treatments is compromised, ECT is an effective and safe alternative.

In schizophrenia, the use of ECT is limited to those patients in whom pharmacotherapy has been unsuccessful. The use of ECT in all other conditions is poorly documented, and its use should be undertaken in research settings, under research protocols.

When the decision to use ECT is made, each patient deserves the full use of modern methods, including anesthesia, oxygenation, muscle relaxation, and the modifications of the induction procedure which minimize persistent effects on brain function. These include the use of unilateral nondominant electrode placements, and/or minimal current instruments. Pretreatment sedation should be minimized, to assure an adequate seizure. Seizures should be monitored, and those which are shorter in duration than some standard (we use 25 seconds) should be immediately repeated. Finally, treatments should be given in settings where the equipment and trained personnel for the emergency management of complications are readily available. In the further management of depressed patients, maintenance drug therapy with tricyclic antidepressants (or their equivalents) should be considered for at least 8 weeks, and probably for 6 months.

Finally, it is time that ECT is clearly recognized as a major treatment in psychiatry, similar to a surgical procedure, and it should be used only by therapists with demonstrated skills who maintain its active practice. Its occasional use, and its unsupervised use by trainees and physicians without special psychiatric skills, is not to be condoned. Only when therapists understand that ECT is a complex procedure, requiring special skills, and when they respect the dignity of their patients not to apply ECT except under optimal conditions, will ECT assume its proper role as a principal treatment of selected cases of the severely mentally ill.

Psychopharmacology—A Recurring Bibliography

The bibliography below is offered to our readers to alert them to recent papers on psychopharmacology from the world literature. It was computer-generated by the Medical Literature Analysis and Retrieval System (MEDLARS) of the National Library of Medicine, National Institutes of Health, and represents papers which were entered into the system during the 3 months before the *Bulletin* went to press.

The subject headings from Index Medicus were selected to reflect significant current interest of the international scientific community. Some nonrelevant citations may appear, and some relevant ones may be absent, but this is usual for machine-generated searches.

Each subsequent issue of the *Bulletin* will provide such a bibliography, which contains two parts—a Subject Section and an Author Section.

Comments and suggestions are invited.

ISSN 0048-5764

SUBJECT SECTION

ACEPROMAZINE

Acepromazine and droperidol inhibition of halothane-induced malignant hyperthermia (porcine stress syndrome) in swine. McGrath CJ, et al. **Am J Vet Res** 1981 Feb;42(2):195–8

Atypical conditions for quantitative recovery of acepromazine and chlorpromazine from plasma. Ballard S, et al. **J Toxicol Environ Health** 1981 May;7(5):745–51

ACETYLCHOLINE

A simplified enzymatic assay for the determination of acetylcholine and choline in discrete structures of rat brain. Bluth R, et al. **Acta Biol Med Ger** 1980;39(8–9):881–7

Acetylcarnitine as a contamination in the radiochemical assay of acetylcholine synthesis in salivary glands and urinary bladders. Banns H, et al. **Acta Physiol Scand** 1981 Feb;111(2):165–9

GABA and its interaction with ACh in the rabbit retina. Redburn DA, et al. **Adv Biochem Psychopharmacol** 1981;29:169–74

Differences in the effects of acetylcholine on the vas deferens from normal and castrated rats. A participation of adrenergic mechanisms. Agostini M del C, et al. **Arch Int Pharmacodyn Ther** 1981 Apr;250(2):212–20

Sodium ion and the effect of acetylcholine on phospholipid and phosphoprotein phosphate turnover in the rabbit iris smooth muscle. Abdel-Latif AA. **Biochem Pharmacol** 1981 Jun 1;30(11):1371–4

Interaction of imipramine with the ionic channel of the acetylcholine receptor of motor endplate and electric organ. Eldefrawi ME, et al. **Biochem Pharmacol** 1981 Jun 1;30(11):1391–4

Mechanism of inactivation (desensitization) of acetylcholine receptor. Investigations by fast reaction techniques with membrane vesicles. Aoshima H, et al. **Biochemistry** 1981 Jun 9;20(12):3467–74

Effect of short electromagnetic pulses on brain acetylcholine content and spontaneous motor activity of mice. Modak AT, et al. **Bioelectromagnetics** 1981;2(1):89–92

Effects of mianserin, desipramine and maprotiline on blood pressure responses evoked by acetylcholine, histamine and 5-hydroxytryptamine in rats. Cavero I, et al. **Br J Pharmacol** 1981 Sep;74(1):143–8

Muscarinic acetylcholine receptors regulation and protein phosphorylation in primary cultures of rat cerebellum. Burgoyne RD, et al. **Brain Res** 1981 Aug;254(1):55–63

The response of individual sympathetic preganglionic neurones to microelectrophoretically applied endogenous monoamines. Coote JH, et al. **Brain Res** 1981 Jun 29;215(1–2):135–45

8-Br-cyclic GMP mimics activation of muscarinic autoreceptor and inhibits acetylcholine release from rat hippocampal slices. Nordström O, et al. **Brain Res** 1981 Jun 1;213(2):467–71

Acetylcholine (Ach) induced alterations of plasma growth hormone (GH) in normal and pimozide-treated ovariectomized rats. Vijayan E, et al. **Brain Res Bull** 1981 Jul;7(1):11–5

Prejunctional inhibition of norepinephrine release caused by acetylcholine in the human saphenous vein. Rorie DK, et al. **Circ Res** 1981 Aug;49(2):337–41

Calcium dependence of prejunctional inhibitory effects of adenosine and acetylcholine on adrenergic neurotransmission in canine saphenous veins. Vanhoutte PM, et al. **Eur J Pharmacol** 1981 Jun 19;72(2–3):189–98

The loss of muscarinic acetylcholine receptors in synaptic membranes under phosphorylating conditions is dependent on calmodulin. Burgoyne RD. **FEBS Lett** 1981 May 5;127(1):144–8

Acetylcholine receptor kinetics at slow fiber neuromuscular junctions. Dionne VE. **Fed Proc** 1981 Sep;40(11):2614–7

Effects of chemical transmitters on function of isolated canine parietal cells. Soll AH, et al. **Fed Proc** 1981 Aug;40(10):2519–23

Effects of exposure to trichloroethylene and tetrachloroethylene on the contents of acetylcholine, dopamine, norepinephrine and serotonin in rat brain. Honma T, et al. **Ind Health** 1980;18(4):171–8

The role of citrate derived from glucose in the acetylcholine synthesis in rat brain synaptosomes. Szutowicz A, et al. **Int J Biochem** 1981;13(8):887–92

Adrenergic neurotransmission in airways: inhibition by acetylcholine. Russell JA, et al. **J Appl Physiol** 1981 Aug;51(2):376–83

A proposed model for the synthesis, storage and release of acetylcholine at the neuromuscular junction. Hancox AJ, et al. **J Biomed Eng** 1981 Jul;3(3):183–95

Effect of acetylcholine on vascular capacity in the dog. Supple EW, et al. **J Clin Invest** 1981 Jul;68(1):64–74

Endplate channel block by guanidine derivatives. Farley JM, et al. **J Gen Physiol** 1981 Mar;77(3):273–93

Electrical Activity in canine sinus node cells during arrest produced by acetylcholine. Woods WT, et al. **J Mol Cell Cardiol** 1981 Apr;13(4):249–57

Acetylcholine incorporation by cholinergic synaptic vesicles from Torpedo marmorata. Diebler MF, et al. **J Neurochem** 1981 Aug;37(2):467–75

Utilization of citrate, acetylcarnitine, acetate, pyruvate and glucose for the synthesis of acetylcholine in rat brain slices. Doležal V, et al. **J Neurochem** 1981 Apr;36(4):1323–30

Decreases in amino acids and acetylcholine metabolism during hypoxia.

Gibson GE, et al. **J Neurochem** 1981 Jul;37(1):192-201

Acetylcholine synthesis and CO2 production from variously labeled glucose in rat brain slices and synaptosomes. Ksiezak HJ, et al. **J Neurochem** 1981 Jul;37(1):88-94

Oxygen dependence of glucose and acetylcholine metabolism in slices and synaptosomes from rat brain. Ksiezak HJ, et al. **J Neurochem** 1981 Aug;37(2):305-14

Quantitation of cholinergic synaptosomes from guinea pig brain. Richardson PJ. **J Neurochem** 1981 Jul;37(1):258-60

Inhibition of the synthesis of acetylcholine in rat brain slices by (-)-hydroxycitrate and citrate. Tuček S, et al. **J Neurochem** 1981 Apr; 36(4):1331-7

The immunocytochemical localization of tyrosine hydroxylase within rat sympathetic neurons that release acetylcholine in culture. Higgins D, et al. **J Neurosci** 1981 Feb,1(2):126-31

Snake alpha-toxin effects on cholinergic and noncholinergic responses of Aplysia californica neurons. Ono JK, et al. **J Neurosci** 1981 Mar; 1(3):259-70

On the role of Ca2+ in the transmitter choice made by cultured sympathetic neurons. Walicke PA, et al. **J Neurosci** 1981 Apr; 1(4):343-50

Use of the single electrode voltage clamp to perform noise and relaxation studies of acetylcholine-activated channels in Aplysia neurons. Wachtel RE, et al. **J Neurosci Methods** 1981 Jun;4(1):87-103

Effects of acetylcholine mustard analogs on schistosome and vertebrate neuromuscular preparations. Willcockson WS, et al. **J Pharmacol Exp Ther** 1981 Aug;218(2):330-6

The characteristics of synaptic currents and responses to acetylcholine of rat submandibular ganglion cells. Rang HP. **J Physiol (Lond)** 1981 Feb;311:23-55

Studies on secretion of catecholamines evoked by acetylcholine or transmural stimulation of the rat adrenal gland. Wakade AR. **J Physiol (Lond)** 1981;313:463-80

Redistribution of intramembrane particles related to acetylcholine release by cholinergic synaptosomes. Israël M, et al. **J Ultrastruct Res** 1981 May;75(2):162-78

Desensitization of the muscarinic acetylcholine receptor of atrium in bullfrogs. Tokimasa T, et al. **Jpn J Physiol** 1981;31(1):83-97

Determination of delta psi, delta pH and the proton electrochemical gradient in isolated cholinergic synaptic vesicles. Angel I, et al. **Life Sci** 1981 Jul 27;29(4):411-6

Increase in rat striatal acetylcholine content by bromocriptine: evidence for an indirect dopaminergic action. Consolo S, et al. **Life Sci** 1981 Aug 3;29(5):457-65

Biphasic dose-response relationship for acetylcholine in the chick jugular vein. Watanabe M, et al. **Life Sci** 1981 Aug 10;29(6):619-26

Brain cholinergic dysfunction and memory in aged rats. Lippa AS, et al. **Neurobiol Aging** 1980 Summer;1(1):13-9

Cholinergic actions of false neurotransmitters: acetylpyrrolidinecholine. Buccafusco JJ, et al. **Neurosci Lett** 1981 May 29;23(3):319-24

Subcellular fractionation of cat submandibular gland: comparative studies on the distribution of acetylcholine and vasoactive intestinal polypeptide (VIP). Lundberg JM, et al. **Neuroscience** 1981;6(6):1001-10

Effects of Cs on acetylcholine induced current. Is ik1 increased by acetylcholine in frog atrium? Ojeda C, et al. **Pflugers Arch** 1981 Jul; 391(1):57-9

The influence of taurine on acetylcholine content and synthesis in rat brain. Kleinrok AT, et al. **Pol J Pharmacol Pharm** 1980 May-Jun; 32(3):313-7

Acetylcholine-induced cation translocation across cell membranes and inactivation of the acetylcholine receptor: chemical kinetic measurements in the millisecond time region. Cash DJ, et al. **Proc Natl Acad Sci USA** 1981 Jun;78(6):3318-22

Does the motor nerve impulse evoke 'non-quantal' transmitter release? Katz B, et al. **Proc R Soc Lond [Biol]** 1981 May 7;212(1186):131-7

Acetylcholine turnover and aggression in related three strains of mice. Karczmar AG, et al. **Prog Neuropsychopharmacol** 1981;5(1):35-48

Cholinergic influences on escape deficits produced by uncontrollable stress. Anisman H, et al. **Psychopharmacology (Berlin)** 1981; 74(1):81-7

Acetylcholine synthesis in synaptosomes: mode of transfer of mitochondrial acetyl coenzyme A. Benjamin AM, et al. **Science** 1981 Sep 25;213(4515):1495-7

Brain acetylcholine synthesis declines with senescence. Gibson GE, et al. **Science** 1981 Aug 7;213(4508):674-6

Effect of acetylcholine and catecholamines on the enterochromaffin-like cells of the stomach. Sano M, et al. **Surg Gynecol Obstet** 1981 Sep; 153(3):337-40

[Concerning the quantum theory of acetylcholine release] Han JS. **Sheng Li Ko Hsueh Chin Chan** 1980 Mar;11(3):255-8 (Chi)

[Acetylcholine diffusion through neuronal membranes] Poskonova MA, et al. **Dokl Akad Nauk SSSR** 1981;257(6):1496-9 (Rus)

[Desensitization of the isolated rat myometrium to biologically active substances] Bordunovskaia VP, et al. **Fiziol Zh SSSR** 1981 Mar; 67(3):390-7 (Eng. Abstr.) (Rus)

[Cholinergic shifts and nibufin therapy in food allergy in children] Khamidullina AKh, et al. **Pediatriia** 1981 Apr;(4):51-3 (Eng. Abstr.) (Rus)

[Effects of certain biologically active compounds and bivalent cations on lactate and malate dehydrogenase activities in cerebral cellular fractions] Bdovichenko LM. **Ukr Biokhim Zh** 1981 May-Jun; 53(3):66-70 (Eng. Abstr.) (Rus)

[Phospholipid metabolism in acetylcholine and substance P induced desensitization of guinea pig ileum smooth muscle] Minenko AN, et al. **Ukr Biokhim Zh** 1980 Sep-Oct;52(5):577-81 (Eng. Abstr.) (Rus)

[Spectrofluorimetric study of interaction between acetylcholine and brain proteins] Sergienko NG, et al. **Ukr Biokhim Zh** 1981 May-Jun; 53(3):18-21 (Eng. Abstr.) (Rus)

ACHIEVEMENT

Relationships between sex-related psychological characteristics during adolescence and catecholamine excretion during achievement stress. Rauste-von Wright M, et al. **Psychophysiology** 1981 Jul;18(4):362-70

AFFECT

Effects of an ACTH short chain neuropeptide in man. Dornbush RL, et al. **Am J Psychiatry** 1981 Jul;138(7):962-4

AFFECTIVE DISORDERS

Monoamines in affective illness. Is there a place for 5HT? Eccleston D. **Br J Psychiatry** 1981 Mar;138:257-8

Antinuclear antibodies and histocompatibility antigens in patients on long-term lithium therapy. Whalley LJ, et al. **J Affective Disord** 1981 Jun;3(2):123-30

Biochemical markers identify mental states [news] Maugh TH 2d. **Science** 1981 Oct 2;214(4516):39-41

[Clinical significance of the erythro-plasmatic ratio of lithium (author's transl)] Braccini T, et al. **Acta Psychiatr Belg** 1980 Jul-Aug; 80(4):413-9 (Eng. Abstr.) (Fre)

AFFECTIVE DISORDERS, PSYCHOTIC

CSF GABA in normal subjects and patients with depression, schizophrenia, mania, and anorexia nervosa. Gerner RH, et al. **Am J Psychiatry** 1981 Aug;138(8):1098-101

Responders and non-responders to lithium therapy. Some potential biological indicators. Mendlewicz J. **Bibl Psychiatr** 1981;(161):63-8 (39 ref.)

Prophylactic and therapeutic profile of lithium. Peselow E, et al. **Bibl Psychiatr** 1981;(161):1-31 (158 ref.)

Mania, crime and the insanity defense: a case report. Ratner RA. **Bull Am Acad Psychiatry Law** 1981;9(1):23-32

Lithium excretion and therapeutic response in mania. Sampath G, et al. **Indian J Med Res** 1981 May;73:768-71

Kidney function in patients with affective disorders with and without lithium therapy. Wahlin A, et al. **Int Pharmacopsychiatry** 1980; 15(4):253-9

The activity of the lithium—sodium countertransport system in erythrocytes in depression and mania. Rybakowski J, et al. **J Affective Disord** 1981 Mar;3(1):59-64

Tricyclic antidepressants do not alter thyroid hormone levels in patients suffering from a major affective disorder. Linnoila M, et al. **Psychiatry Res** 1981 Jun;4(3):357-60

[Unsolved problems in the indications for lithium prophylaxis in affective and schizoaffective disorders] Angst J. **Bibl Psychiatr** 1981; (161):32-44 (Eng. Abstr.) (Ger)

[Effects of lithium on normal psychic functions as a restriction on prophylactic use] Kropf D. **Bibl Psychiatr** 1981;(161):141-51 (Eng. Abstr.) (Ger)

[Motor reactivity during lithium prophylaxis] Oppenoorth E, et al. **Bibl Psychiatr** 1981;(161):152-69 (Eng. Abstr.) (Ger)

[Clinico-psychopathologic research on prophylactic lithium therapy]

Teufel S, et al. **Bibl Psychiatr** 1981;(161):58-62 **(Ger)**

[A study on the prevention of recurrences of affective diseases using lithium] Felber W. **Psychiatr Neurol Med Psychol (Leipz)** 1981 Jun; 33(6):330-2 **(Ger)**

[Comparative characteristics of the preventive properties of short-acting and delayed-action lithium carbonate in endogenous affective psychoses] Panteleeva GP, et al. **Zh Nevropatol Psikhiatr** 1981; 81(3):406-12 (Eng. Abstr.) **(Rus)**

AGGRESSION

Regional changes in brain norepinephrine content in relation to mouse-killing behavior by rats. Yoshimura H, et al. **Brain Res Bull** 1981 Aug;7(2):151-5

Neurochemical correlates of muricidal behavior in rats. Valzelli L, et al. **Neuropsychobiology** 1981;7(4):172-8

Dietary tryptophan and aggressive behavior in rats. **Nutr Rev** 1981 Jul; 39(7):284-5

Beta-adrenoreceptor antagonists enhance the benzodiazepine-induced suppression of footshock induced fighting in mice. Roliński Z, et al. **Pol J Pharmacol Pharm** 1980;32(5):731-8

Acetylcholine turnover and aggression in related three strains of mice. Karczmar AG, et al. **Prog Neuropsychopharmacol** 1981;5(1):35-48

[GABA-ergic correlates of aggression and intraspecies sociability of mice subjected to isolation] Poshivalov VP. **Biull Eksp Biol Med** 1981 May; 91(5):584-7 (Eng. Abstr.) **(Rus)**

AMINO ACIDS

Amino acid neurotransmitters. **Adv Biochem Psychopharmacol** 1981; 29:1-572

Biochemistry of central active amino acids. Bachelard HS. **Adv Biochem Psychopharmacol** 1981;29:475-97 (57 ref.)

Amino acids and presynaptic inhibition. Davidoff RA. **Adv Biochem Psychopharmacol** 1981;29:249-55 (50 ref.)

Physiological study of amino acid uptake and receptor desensitization: the GABA system in dorsal root ganglia. Désarménien M, et al. **Adv Biochem Psychopharmacol** 1981;29:309-19

Neuron-glia interactions in the biosynthesis and release of transmitter amino acids. Hamberger A, et al. **Adv Biochem Psychopharmacol** 1981; 29:509-18 (29 ref.)

Uptake inhibitors, amino acids, and spinal neurones. Lodge D. **Adv Biochem Psychopharmacol** 1981;29:327-32 (32 ref.)

New insights into the mechanism of action of inhibitory amino acids on frog spinal neurones. Nistri A. **Adv Biochem Psychopharmacol** 1981; 29:263-9

Studies with excitatory amino acid antagonists in rat CNS: 2-amino-5-phosphonovaleric acid, phenytoin, and benzodiazepines. Stone TW. **Adv Biochem Psychopharmacol** 1981;29:223-30

Rat undercut cortex as a model for the study of central amino acid transmission. Ulmar G. **Adv Biochem Psychopharmacol** 1981; 29:105-13

Pharmacology of excitatory amino acid transmitters. Watkins JC. **Adv Biochem Psychopharmacol** 1981;29:205-12 (31 ref.)

Uptake and asymmetric efflux of amino acids at maternal and fetal sides of placenta. Eaton BM, et al. **Am J Physiol** 1981 Sep; 241(3):C106-12

Effects of ammonia infusion on plasma glucagon, insulin, and amino acids in intact, pancreatectomized, and adrenalectomized dogs. Strombeck DR, et al. **Am J Vet Res** 1981 May;42(5):810-8

Combined thin-layer chromatography/mass spectrometry without substance elution. Use of direct identification of phenols, steroids, nucleosides, biogenic amines, and amino acids. Kraft R, et al. **Anal Biochem** 1981 May 1;113(1):193-6

Amino acid degradation by anaerobic bacteria. Barker HA. **Annu Rev Biochem** 1981;50:23-40 (77 ref.)

In vivo chemical modification of proteins (post-translational modification). Wold F. **Annu Rev Biochem** 1981;50:783-814 (199 ref.)

Effects of amino acid analogues on protein degradation in isolated rat hepatocytes. Grinde B, et al. **Biochim Biophys Acta** 1981 Aug 5; 676(1):43-50

Utilization of amino acid analogues in diets of young turkeys. Parsons CM, et al. **Br J Nutr** 1981 Jul;46(1):77-86

Availability to pigs of amino acids in cereal grains. 2. Apparent and true ileal availability. Taverner MR, et al. **Br J Nutr** 1981 Jul; 46(1):159-71

Patterns of endogenous amino acid release from slices of rat and guinea-pig olfactory cortex. Collins GG, et al. **Brain Res** 1981 Jan 5; 204(1):103-20

Developmental changes in brain indoles, serum tryptophan and other serum neutral amino acids in the rat. Zeisel SH, et al. **Brain Res** 1981 Jul;227(4):551-64

Inhibitory actions of amino acids in the preoptic-anterior hypothalamus of the rat. Mayer ML. **Exp Brain Res** 1981;43(2):154-8

The differential distribution of label following uptake of 3H-labeled amino acids in the dorsal cochlear nucleus of the cat. An autoradiographic study. Schwartz IR. **Exp Neurol** 1981 Sep;73(3):601-17

The tsx protein of Escherichia coli can act as a pore for amino acids. Heuzenroeder MW, et al. **J Bacteriol** 1981 Sep;147(3):1113-6

Properties of abnormal proteins degraded rapidly in reticulocytes. Intracellular aggregation of the globin molecules prior to hydrolysis. Klemes Y, et al. **J Biol Chem** 1981 Aug 25;256(16):8436-44

Effect of beta-bungarotoxin on the release of endogenous amino aids from the sensorimotor cortex. Abdul-Ghani AS, et al. **J Neurochem** 1981 Jul;37(1):251-4

Decreases in amino acids and acetylcholine metabolism during hypoxia. Gibson GE, et al. **J Neurochem** 1981 Jul;37(1):192-201

Decreased glutamate uptake in subcortical areas deafferented by sensorimotor cortical ablation in the cat. Young AB, et al. **J Neurosci** 1981 Mar;1(3):241-9

Specificity of neutral amino acid uptake at the basolateral side of the epithelium in the cat salivary gland in situ. Bustamante JC, et al. **J Physiol (Lond)** 1981;313:65-79

Incorporation of various amino acids into non-histone chromatin protein fractions of spleen cells of mice immunized with IgG. Rakowicz-Szulczyńska EM, et al. **Mol Cell Biochem** 1981 Jun 9; 37(1):13-9

Effect of L-dopa treatment on cerebral amino acid levels in rats after portocaval anastomosis. Zanchin G, et al. **Neurochem Res** 1981 Jun; 6(6):649-58

The interaction between barbiturate anaesthetics and excitatory amino acid responses on cat spinal neurones. Lambert JD, et al. **Neuropharmacology** 1981 Mar;20(3):227-40

Motilin release by intravenous infusion of nutrients and somatostatin in conscious dogs. Mori K, et al. **Regul Pept** 1981 Jan;1(4):265-70

[Nutritional habits of children with portosystemic anastomoses--effects on serum ammonia and amino acid level] Cario RW, et al. **Kinderaerztl Prax** 1981 May;49(5):245-51 (Eng. Abstr.) **(Ger)**

[Deficiency of amino acid precursors of chemical mediators and of creatine in the aged] Bertolini AM, et al. **Minerva Med** 1981 Sep 8; 72(32):2157-60 **(Ita)**

AMITRIPTYLINE

Differential effect of REM stimulating and REM inhibiting drugs (reserpine and amitriptylin) on memory. Faber J, et al. **Act Nerv Super (Praha)** 1981 Jun;23(2):169-71

Pharmacokinetics and efficacy of maprotiline and amitriptyline in endogenous depression: a double-blind controlled trial. Montgomery SA, et al. **Clin Ther** 1980;3(4):292-310

Amitriptyline and nortriptyline plasma levels monitoring. Perspective in clinical practice. Corona GL, et al. **Commun Psychopharmacol** 1980; 4(4):309-16

Appropriate treatment of fibromyositis [letter] Labowitz RJ, et al. **Del Med J** 1981 Aug;53(8):389

Interaction of desipramine and amitriptyline with adrenergic mechanisms in the human iris in vivo. Szabadi E, et al. **Eur J Clin Pharmacol** 1981; 19(6):403-8

Reliability of tricyclic antidepressant levels — further questions [letter] Bank RL, et al. **J Clin Psychiatry** 1981 Sep;42(9):364

Pre- and postsynaptic adrenergic activation by norepinephrine reuptake inhibitors in the field-stimulated rat vas deferens. Lotti VJ, et al. **Life Sci** 1981 Aug 10;29(6):633-9

Amitriptyline and scopolamine in an animal model of depression. Katz RJ, et al. **Neurosci Biobehav Rev** 1981 Summer;5(2):265-71

Management of depressive neurosis. Shaw SH. **Practitioner** 1981 Feb; 225(1352):228-30

Double-blind comparative study of clomipramine and amitriptyline in obsessive neurosis. Ananth J, et al. **Prog Neuropsychopharmacol** 1981; 5(3):257-62

Treatment validity of different diagnostic concepts of depression. Zisook S, et al. **Psychiatry Res** 1981 Aug;5(1):77-85

Continuation therapy with lithium and amitriptyline in unipolar depressive illness: a controlled clinical trial. A report by the Medical Research Council Drug Trials Subcommittee. **Psychol Med** 1981 May; 11(2):409-16

Amitriptyline pharmacokinetics. Single doses of Lentizol compared with ordinary amitriptyline tablets. Burch JE, et al. **Psychopharmacology (Berlin)** 1981;74(1):43-50

Amitriptyline pharmacokinetics. A crossover study with single doses of amitriptyline and nortriptyline. Burch JE, et al. **Psychopharmacology (Berlin)** 1981;74(1):35-42

[Pharmacological influences on the brain level and transport of GABA. II) Effect of various psychoactive drugs on brain level and uptake of GABA] Gabana MA, et al. **Boll Soc Ital Biol Sper** 1981 Apr 30; 57(8):909-13 (Eng. Abstr.) **(Ita)**

AMOBARBITAL

Relationship between polymorphism and bioavailability of amobarbital in the rabbit. Kato Y, et al. **Chem Pharm Bull (Tokyo)** 1981 Jan; 29(1):268-72

AMPHETAMINE

Conformational analysis of pGlu-His-Amph and pGlu-His-Pro-Amph related to their central nervous system activity. Morier E, et al. **Biochimie** 1981 Jun;63(6):495-505

Endogenous hyperprolactinaemia enhances amphetamine- and apomorphine-induced stereotypy. Drago F, et al. **Eur J Pharmacol** 1981 Jun 19;72(2-3):249-53

The regional distribution of d-amphetamine and local glucose utilization in rat brain during continuous amphetamine administration. Eison MS, et al. **Exp Brain Res** 1981;43(3-4):281-8

Stimulating effects of amphetamine on the visual system. Andreeva OG, et al. **Hum Physiol** 1980 May-Jun;6(3):199-205

Application of chiral lanthanide nuclear magnetic resonance shift reagents to pharmaceutical analysis. II. Determination of dextro- and levoamphetamine mixtures. Wainer IW, et al. **J Assoc Off Anal Chem** 1981 Jul;64(4):848-50

Impurities in illicit amphetamine. Huizer H, et al. **J Forensic Sci Soc** 1981 Jul;21(3):225-32

3H-amphetamine concentrations in the brains of young and aged rats: implications for assessment of drug effects in aged animals. Truex LL, et al. **Neurobiol Aging** 1980 Summer;1(1):93-5

Amphetamine and tranylcypromine in an animal model of depression: pharmacological specificity of the reversal effect. Katz RJ, et al. **Neurosci Biobehav Rev** 1981 Summer;5(2):259-64

Amphetamine and increases in current intensity modulate reward in the hypothalamus and substantia nigra but not in the prefrontal cortex. Robertson A, et al. **Physiol Behav** 1981 May;26(5):809-13

Synergistic induction of pineal gland N-acetyltransferase activity by amphetamine and L-DOPA. Altar A, et al. **Proc West Pharmacol Soc** 1981;24:101-4

Chronic haloperidol treatment fails to alter the anorexic actions of dopaminergic agonists and cholinergic drugs. Hynes MD, et al. **Prog Neuropsychopharmacol** 1981;5(3):271-5

Amphetamine enhancement of reward asymmetry. Glick SD, et al. **Psychopharmacology (Berlin)** 1981;73(4):323-7

Self-stimulation and amphetamine: tolerance to d and l isomers and cross tolerance to cocaine and methylphenidate. Leith NJ, et al. **Psychopharmacology (Berlin)** 1981;74(1):23-8

[Biotransformation of amphetamine derivatives by rat liver mitochondria/2nd communication; Oxidative deamination of amphetamine and reduction of phenylacetone] Blume H. **Arzneimittelforsch** 1981;31(6):994-7 (Eng. Abstr.) (Ger)

[Mechanism of pantogam potentiation of certain effects of hexobarbital and sodium barbital and inhibition of phenamine hyperactivity] Avakumov VM, et al. **Farmakol Toksikol** 1981 Jan-Feb;44(1):30-4 (Eng. Abstr.) (Rus)

AMPHETAMINES

Methylenedioxyamphetamine. Clinical description of overdose, death, and review of pharmacology. Simpson DL, et al. **Arch Intern Med** 1981 Oct;141(11):1507-9

'Problem children' and stimulant drug treatment. Prior M. **Aust NZ J Psychiatry** 1981 Jun;15(2):117-21

Conformational analysis of pGlu-His-Amph and pGlu-His-Pro-Amph related to their central nervous system activity. Morier E, et al. **Biochimie** 1981 Jun;63(6):495-505

Emergence of supraependymal cells in rat third ventricle after administration of p-chloroamphetamine. Saland LC, et al. **Brain Res Bull** 1981 Jun;6(6):517-24

3-O-methyl-alpha-methyldopamine, a urinary metabolite of p-methoxyamphetamine in dog and monkey. Hubbard JW, et al. **Drug Metab Dispos** 1981 May-Jun;9(3):250-4

Violence: the ugly face of amphetamine abuse. Siomopoulos V. **IMJ** 1981 Jun;159(6):375-7

Studies on chiral interactions of 1-(2,5-dimethoxy-4-methylphenyl)-2-aminopropane and the corresponding N-hydroxy metabolites with cytochrome P-450. McGraw NP, et al. **J Med Chem** 1981 Mar;24(3):299-304

Different action of 5-hydroxytryptamine (5-HT) uptake inhibitors on fenfluramine- but not p-chloramphetamine-induced hyperthermia in rats. Pawlowski L. **J Pharm Pharmacol** 1981 Aug;33(8):538-40

Profiles of psychedelic drugs: 10. DOB. Shulgin A. **J Psychoactive Drugs** 1981 Jan-Mar;13(1):99

The acute effect of p-chloroamphetamine on the retention of fear conditioning in the rat: evidence for a role of serotonin in memory consolidation. Archer T, et al. **Neurosci Lett** 1981 Aug 7;25(1):75-81

Circadian variation in the head twitch response produced by 5-methoxy-N1,N1-dimethyltryptamine and p-chloroamphetamine in the mouse. Singleton C, et al. **Psychopharmacology (Berlin)** 1981;74(2):173-6

[The effects of Citrus aurantium and its active ingredient N-methyltyramine on the cardiovascular receptors (author's transl)] Chen X, et al. **Yao Hsueh Hsueh Pao** 1981 Apr;16(4):253-9 (Eng. Abstr.) (Chi)

[Biotransformation of amphetamine derivatives by rat liver mitochondria / 1st communication: Oxidative dealkylation of N,N-dialkyl- and N-alkylamphetamines (author's transl)] Blume H. **Arzneimittelforsch** 1981;31(5):805-9 (Eng. Abstr.) (Ger)

ANOREXIA NERVOSA

Prolactin secretion in anorexia nervosa. Caufriez A, et al. **Acta Psychiatr Belg** 1980 Jul-Aug;80(4):546-50

CSF GABA in normal subjects and patients with depression, schizophrenia, mania, and anorexia nervosa. Gerner RH, et al. **Am J Psychiatry** 1981 Aug;138(8):1098-101

Catecholamine metabolism and body weight in anorexia nervosa. Abraham SF, et al. **Br J Psychiatry** 1981 Mar;138:244-7

Continuous infusion of luteinizing hormone releasing hormone (LHRH) in patients with anorexia nervosa. Beumont PJ, et al. **Psychol Med** 1981 Aug;11(3):477-84

ANTIDEPRESSIVE AGENTS

Drug treatment of depression in children. Pearce JB. **Acta Paedopsychiatr (Basel)** 1981 Feb;46(5-6):317-28

Effects of an ACTH short chain neuropeptide in man. Dornbush RL, et al. **Am J Psychiatry** 1981 Jul;138(7):962-4

Inhibition of rat liver tryptophan pyrrolase activity and elevation of brain tryptophan concentration by administration of antidepressants. Badawy AA, et al. **Biochem Pharmacol** 1981 Jun 1;30(11):1211-6

Effects of caroxazone, a reversible monoamine oxidase inhibitor, on the pressor response to intravenous tyramine in man. Martini A, et al. **Br J Clin Pharmacol** 1981 Jun;11(6):605-10

Effects of caroxazone, a reversible monoamine oxidase inhibitor, on the pressor response to oral tyramine in man. Martini A, et al. **Br J Clin Pharmacol** 1981 Jun;11(6):611-5

Effect of caroxazone, a new antidepressant drug, on monoamine oxidases in healthy volunteers. Moretti A, et al. **Br J Clin Pharmacol** 1981 May;11(5):511-5

Use of potentiation of thyrotrophin releasing hormone (TRH)-induced hyperthermia as a test for screening antidepressants which activate alpha-adrenoceptor systems. Desiles M, et al. **Br J Pharmacol** 1981 Sep;74(1):81-6

An experimental study of the clinical judgment of general physicians in evaluating and prescribing for depression. Fisch HU, et al. **Br J Psychiatry** 1981 Feb;138:100-9

The antidepressant effects of trazodone and inhibition of platelet serotonin reuptake. Mann JJ, et al. **Commun Psychopharmacol** 1980;4(4):293-301

Plasma levels, elimination and metabolic fate of 4a-amino-8-chloro-2-methyl-1,2,3,4,4a,10a-hexahydro-10H-benzopyr acid lactam, a new antidepressive agent, in rats and dogs. Belleville M, et al. **Drug Metab Dispos** 1981 May-Jun;9(3):233-9

Current antidepressant drugs: their clinical use. Hollister LE. **Drugs** 1981 Aug;22(2):129-52 (93 ref.)

Pharmacokinetics of zimelidine in humans--plasma levels and urinary excretion of zimelidine and norzimelidine after intravenous and oral administration of zimelidine. Love BL, et al. **Eur J Clin Pharmacol** 1981;20(2):135-9

Down-regulation of beta-adrenergic activity in astroglia by chronic treatment with an antidepressant drug. Hertz L, et al. **Eur J Pharmacol** 1981 Jun 19;72(2-3):267-8

Differential effects of electroconvulsive shock and antidepressant drugs on serotonin-2 receptors in rat brain. Kellar KJ, et al. **Eur J Pharmacol** 1981 Feb 19;69(4):515-8

Effects of antidepressants in the rat forced swimming test. Kitada Y, et al. **Eur J Pharmacol** 1981 Jun 19;72(2-3):145-52

Refractory depression: prediction of non-response by clinical indicators. Kupfer DJ, et al. **J Clin Psychiatry** 1981 Aug;42(8):307-12

Immobility test: effects of 5-hydroxytryptaminergic drugs and role of catecholamines in the activity of some antidepressants. Borsini F, et al. **J Pharm Pharmacol** 1981 Jan;33(1):33-7

Studies on the effect of antidepressants on kinetics and metabolism of tyramine. Faraj BA, et al. **J Pharmacol Exp Ther** 1981 Sep;218(3):750-7

Multicentre depression [editorial] **Lancet** 1981 Sep 12;2(8246):563-4

Trazodone--a new antidepressant. Al-Yassiri MM, et al. **Life Sci** 1981 Jun 1;28(22):2449-58 (106 ref.)

Modification of affinity of postsynaptic serotonin receptors by antidepressant drugs. Fillion G, et al. **Nature** 1981 Jul 23;292(5821):349-51

Amitriptyline and scopolamine in an animal model of depression. Katz RJ, et al. **Neurosci Biobehav Rev** 1981 Summer;5(2):265-71

Current concepts of the mechanisms of action of antidepressant drugs. Sugrue MF. **Pharmacol Ther** 1981;13(2):219-47 (262 ref.)

Clinical pharmacological studies with LM 5008, a new antidepressant. Iliopoulou A, et al. **Pharmatherapeutica** 1981;2(9):613-21

Double-blind assessment of the activity of minaprine (30038-CB) in child psychiatry. Maffia AG. **Pharmatherapeutica** 1981;2(9):601-6

The effect of antidepressants on behavioral despair in rats. Górka Z, et al. **Pol J Pharmacol Pharm** 1980 Jul-Aug;32(4):463-8

Studies on the action of antidepressant drugs of second generation. Maj J. **Pol J Pharmacol Pharm** 1980 Jul-Aug;32(4):437-49

Preliminary study of the biotransformation of two new drugs, trazodone and etoperidone. Melzacka M, et al. **Pol J Pharmacol Pharm** 1980 Jul-Aug;32(4):551-6

The central action of salbutamol, a beta-agonist with a potential antidepressant activity. Przegalinski E, et al. **Pol J Pharmacol Pharm** 1980 Jul-Aug;32(4):485-93

Interaction between antidepressants and alpha-adrenergic receptor blocking agents. Zebrowska-Lupina I, et al. **Pol J Pharmacol Pharm** 1980;32(5):673-80

Acute amphetamine response predicts antidepressant and antipsychotic responses to lithium carbonate in schizophrenic patients. van Kammen DP, et al. **Psychiatry Res** 1981 Jun;4(3):313-25

Involvement of the amygdala in the effect of antidepressants on the passive avoidance deficit in bulbectomised rats. Garrigou D, et al. **Psychopharmacology (Berlin)** 1981;74(1):66-70

Chronic treatment with some atypical antidepressants increases the brain level of 3-methoxy-4-hydroxyphenylglycol (MHPG) in rats. Przegaliński E, et al. **Psychopharmacology (Berlin)** 1981;74(2):187-90

Differences in presynaptic alpha-blockade, noradrenaline uptake inhibition, and potential antidepressant activity between (+)- and (-)mianserin. Schoemaker H, et al. **Psychopharmacology (Berlin)** 1981;74(2):137-42

[Pyrazidole in the treatment of endogenous depression: controlled study (author's transl)] Zapletálek M, et al. **Cesk Psychiatr** 1981 Feb;77(1):31-7 (Eng. Abstr.) **(Cze)**

[Mechanism of action and indications for psychopharmaceutic agents; possibilities and limitations in the elderly] Verhoeven WM. **Gerontologie** 1981 Aug;12(3):126-38 (Eng. Abstr.) **(Dut)**

[Physiopathology of inhibition and proposals for an original therapeutic response] Laborit H. **Agressologie** 1981;22(2):45-53 (90 ref.) (Eng. Abstr.) **(Fre)**

[Effects of minaprine hydrochloride on changes in body weight, blood pressure and cerebral amine concentrations induced by unavoidable planter electric shock] Laborit H, et al. **Agressologie** 1981;22(2):59-62 (Eng. Abstr.) **(Fre)**

[Influence of the procedure of administration in the activity of some antidepressant or disinhibiting drugs upon behavioural despair (author's transl)] Scotto di Tella AM, et al. **J Pharmacol** 1981 Apr-Jun;12(2):179-88 (Eng. Abstr.) **(Fre)**

[Antidepressive drugs] Rouillon F, et al. **Soins Psychiatr** 1981 Jan;(7):27-32 **(Fre)**

[Duration of prophylactic medication with antidepressives] Pöldinger W. **Bibl Psychiatr** 1981;(161):237-43 **(Ger)**

[Studies on the circulatory side-effects of 2-[3'-diethylaminopropyl-(1')-carbamoyl]-6,7-dimethoxy-1-thiaiso-chroxide ('16-252') (author's transl)] Rostock A, et al. **Pharmazie** 1981 Apr;36(4):287-90 **(Ger)**

[Comparative mydriatic effect of different groups of antidepressants] Polezhaeva AI, et al. **Farmakol Toksikol** 1981 Jan-Feb;44(1):15-7 (Eng. Abstr.) **(Rus)**

ANTISOCIAL PERSONALITY DISORDER

[Psychopathy or mental disequilibrium] Massé G. **Infirm Fr** 1981 Jun;(726):3-5 **(Fre)**

ANXIETY

Alprazolam (Xanax, the Upjohn Company). Evans RL. **Drug Intell Clin Pharm** 1981 Sep;15(9):633-8

The how of anxiety [editorial] **Lancet** 1981 Aug 1;2(8240):237-9

Is the isolated animal a possible model for phobia and anxiety? Garattini S, et al. **Prog Neuropsychopharmacol** 1981;5(2):159-65 (56 ref.)

Animal models of anxiety. Gray JA, et al. **Prog Neuropsychopharmacol** 1981;5(2):143-57 (40 ref.)

Comparison of anti-conflict drug effects in three experimental animal models of anxiety. Kilts CD, et al. **Psychopharmacology (Berlin)** 1981;74(3):290-6

[The treatment of an anxiety - depression syndrome in young women. Report of a case (author's transl)] Leyne P. **Sem Hop Paris** 1981 Jun 18-25;57(25-28):1226-7 (Eng. Abstr.) **(Fre)**

[Neurophysiology of anxiety] Debray Q, et al. **Soins Psychiatr** 1981 Mar;(8):3-5 **(Fre)**

[Anxiety; pharmacological bases of treatment] de Andrés Rodriguez-Trelles F. **An R Acad Nac Med (Madr)** 1981;98(1):69-116 (68 ref.) **(Spa)**

ANXIETY DISORDERS

Treatment of spontaneous panic attacks with chlomipramine. Gloger S, et al. **Am J Psychiatry** 1981 Sep;138(9):1215-7

Interesting uses of beta blockers (3): Beta blockers in anxiety. Ogborne WL. **Aust Fam Physician** 1981 Jun;10(6):472-5

Trazodone: a review of its pharmacological properties and therapeutic use in depression and anxiety. Brogden RN, et al. **Drugs** 1981 Jun;21(6):401-29 (156 ref.)

Doxepin plasma levels and anxiolytic response. Norman TR, et al. **Int Pharmacopsychiatry** 1980;15(4):247-52

Multicenter double-blind efficacy and safety study comparing alprazolam, diazepam and placebo in clinically anxious patients. Cohn JB **J Clin Psychiatry** 1981 Sep;42(9):347-51

[Anxiety; pharmacological bases of treatment] de Andrés Rodriguez-Trelles F. **An R Acad Nac Med (Madr)** 1981;98(1):69-116 (68 ref) **(Spa)**

APOMORPHINE

Kainic acid induced lesion of ventral tegmental area: locomotor effect of apomorphine. Morgenstern R. **Acta Biol Med Ger** 1980;39(8-9):911-5

An analysis of the effects of apomorphine and haloperidol on the release of [3H]-dopamine and [3H]-noradrenaline from rabbit brain slices. Kelly MJ. **Arch Int Pharmacodyn Ther** 1981 Mar;250(1):18-29

Differential effects of estrogen and androgen on locomotor activity induced in castrated male rats by amphetamine, a novel environment, or apomorphine. Menniti FS, et al. **Brain Res** 1981 Jul 6;216(1):89-107

Changes in dopamine and DOPAC following systemic administration of apomorphine and 3,4-dihydroxyphenylamino-2-imidazoline (DPI) in rats. Springer J, et al. **Brain Res** 1981 Sep 7;220(1):226-30

Apomorphine in schizophrenia. Hollister LE, et al. **Commun Psychopharmacol** 1980;4(4):277-81

Apomorphine, haloperidol and the average evoked potentials in normal human volunteers. Rey AC, et al. **Commun Psychopharmacol** 1980;4(4):327-34

Apomorphine-induced stereotypy in mature and senescent rats following cessation of chronic haloperidol treatment. Roffman M, et al. **Commun Psychopharmacol** 1980;4(4):283-6

Endogenous hyperprolactinaemia enhances amphetamine- and apomorphine-induced stereotypy. Drago F, et al. **Eur J Pharmacol** 1981 Jun 19;72(2-3):249-53

Effect of L-histidine and chlorcyclizine on apomorphine-induced climbing behaviour and methamphetamine stereotypy in mice. Joshi VV, et al. **Eur J Pharmacol** 1981 Feb 19;69(4):499-502

Detailed analysis of the effects of apomorphine and d-amphetamine on spontaneous locomotor behaviour of rats as measured in a TV-based, automated open-field system. Nickolson VJ. **Eur J Pharmacol** 1981 Jun 10;72(1):45-56

Potentiation by Des-Tyr-gamma-endorphin on apomorphine-induced changes in rat open field behavior. Nickolson VJ. **Eur J Pharmacol** 1981 Jun 10;72(1):77-81

REM sleep deprivation induces subsensitivity of dopamine receptors mediating sedation in rats. Serra G, et al. **Eur J Pharmacol** 1981 Jun 10;72(1):131-5

Injection of low doses of apomorphine into the nucleus accumbens of rats reduces locomotor activity. Van Ree JM, et al. **Eur J Pharmacol** 1981 Jun 10;72(1):107-11

Induction of behavioral supersensitivity to apomorphine by DFP treatment. Davis KL, et al. **Life Sci** 1981 Apr 27;28(17):1953-9

Pharmacological difference of L-dopa, apomorphine, and bromocriptine against metoclopramide. Fang VS. **Life Sci** 1981 May 11;28(19):2143-9

The role of 5-hydroxytryptamine in dopamine-dependent stereotyped behaviour. Carter CJ, et al. **Neuropharmacology** 1981 Mar;20(3):261-5

Single or repeated administration of small doses of apomorphine on water intake and activity in water-deprived rats. Dourish CT, et al. **Neuropharmacology** 1981 Mar;20(3):257-60

Chronic haloperidol treatment fails to alter the anorexic actions of dopaminergic agonists and cholinergic drugs. Hynes MD, et al. **Prog Neuropsychopharmacol** 1981;5(3):271-5

[Toxicity of organic phosphates under the influence of neuroleptics] Andreas K, et al. **Acta Biol Med Ger** 1980;39(8-9):987-9 **(Ger)**

[Studies on the situational factors affecting the effect of psychotropic drugs. II. Circadian fluctuation of sedative and anti-apomorphine effects of chlorpromazine (author's transl)] Takagi A. **Seishin Shinkeigaku Zasshi** 1981;83(4):236-50 **(Jpn)**

APPETITE

Effect of lithium intake on sodium and lithium appetite in sodium deficient cattle. Sly J, et al. **Physiol Behav** 1981 Jul;27(1):147-52

AROMATIC AMINO ACID DECARBOXYLASES

Aromatic L-amino acid decarboxylase activity in central and peripheral tissues and serum of rats with L-DOPA and L-5-hydroxytryptophan as substrates. Rahman MK, et al. **Biochem Pharmacol** 1981 Mar 15;

30(6):645-9

Inhibition of the renin-angiotensin-aldosterone system by L-dopa with and without inhibition of extracerebral dopa decarboxylase in man. Barbieri C, et al. **Clin Sci** 1981 Aug;61(2):187-90

AROUSAL

A pilot study to evaluate the effect of acute and long-term administration of cyclandelate on the vigilance of subjects submitted to hypoxic conditions. Preliminary report. Schaffler K, et al. **Arzneimittelforsch** 1981;31(6):1032-5

ATTENTION

Tryptophan metabolism in children with attentional deficit disorder. Irwin M, et al. **Am J Psychiatry** 1981 Aug;138(8):1082-5

Disrupted latent inhibition in the rat with chronic amphetamine or haloperidol-induced supersensitivity: relationship to schizophrenic attention disorder. Solomon PR, et al. **Biol Psychiatry** 1981 Jun; 16(6):519-37

The influence of fragments of the LPH chains on learning, memory and attention in animals and man. Sandman CA, et al. **Pharmacol Ther [B]** 1981;13(1):39-60 (76 ref.)

Psychomotor performance and real driving performance of outpatients receiving diazepam. de Gier JJ, et al. **Psychopharmacology (Berlin)** 1981; 73(4):340-4

AUDITORY PERCEPTION

Early auditory and visual function in normal and hyperthyroid rats. Brunjes PC, et al. **Behav Neural Biol** 1981 Apr;31(4):393-412

[Analysis of auditory averaged evoked potentials (AEP)- description of a fully automated procedure for AEP analysis (author's transl)] Hofmann W, et al. **EEG EMG** 1981 Jun;12(2):84-9 (Eng. Abstr.) (Ger)

AUTISM, INFANTILE

Effects of vitamin B6 on averaged evoked potentials in infantile autism. Martineau J, et al. **Biol Psychiatry** 1981 Jul;16(7):627-41

AVOIDANCE LEARNING

Failure of albino guinea pigs to exhibit Lavin's poisoned partner effect. Revusky S, et al. **Behav Neural Biol** 1981 May;32(1):111-3

Extinction of a conditioned taste aversion in young, mid-aged, and aged C57/BL6 mice. Springer AD, et al. **Behav Neural Biol** 1981 Jul; 32(3):282-94

Effects of 60-Hz electric fields on avoidance behavior and activity of rats. Hjeresen DL, et al. **Bioelectromagnetics** 1980;1(3):299-312

Plasma catecholamines: effects of footshock level and hormonal modulators of memory storage. McCarty R, et al. **Horm Behav** 1981 Jun;15(2):168-82

Relation of consummatory responses and preabsorptive insulin release to palatability and learned taste aversions. Berridge K, et al. **J Comp Physiol Psychol** 1981 Jun;95(3):363-82

Effect of trigeminal tractotomy on behavioral response to dental pulp stimulation in the monkey. Young RF, et al. **J Neurosurg** 1981 Sep; 55(3):420-3

Effects of morphine and chlordiazepoxide on avoidance behaviour in two inbred strains of mice. Cuomo V, et al. **Neuropharmacology** 1981 Mar; 20(3):301-4

Effect of injury to the serotoninergic and noradrenergic brain systems on food and defensive conditioned reflexes in rats. Gromova EA, et al. **Neurosci Behav Physiol** 1981 Jan-Feb;11(1):10-5

Drugs and taste aversion. Rondeau DB, et al. **Neurosci Biobehav Rev** 1981 Summer;5(2):279-94 (135 ref.)

Effects of nortriptyline treatment on learned helplessness in the rat. Telner JI, et al. **Pharmacol Biochem Behav** 1981 Jun;14(6):823-6

Sexually dimorphic acquisition of a conditioned taste aversion in rats: effects of gonadectomy, testosterone replacement and water deprivation. Chambers KC, et al. **Physiol Behav** 1981 Jul;27(1):83-8

Paradoxical sleep deprivation and performance of an active avoidance task: impairment of c57BR mice and no effect in c57BL/6 mice. Kitahama K, et al. **Physiol Behav** 1981 Jul;27(1):41-50

Noradrenergic and dopaminergic interactions in escape behavior: analysis of uncontrollable stress effects. Anisman H, et al. **Psychopharmacology (Berlin)** 1981;74(3):263-8

Involvement of the amygdala in the effect of antidepressants on the passive avoidance deficit in bulbectomised rats. Garrigou D, et al. **Psychopharmacology (Berlin)** 1981;74(1):66-70

Pre-exposure effects of morphine, diazepam and delta 9-THC on the formation of conditioned taste aversions. Switzman L, et al. **Psychopharmacology (Berlin)** 1981;74(2):149-57

[Dopamine concentration in the nigro-striatal system during elaboration and performance of conditioned avoidance reactions of various complexity in rats] Saul'skaia NB. **Fiziol Zh SSSR** 1981 Jun; 67(6):797-803 (Eng. Abstr.) (Rus)

[Age and sex differences in the elaboration and maintenance of conditioned taste aversion in rats] Kassil' VG, et al. **Zh Vyssh Nerv Deiat** 1981 May-Jun;31(3):630-2 (Rus)

[Participation of hypothalamic noradrenergic structures in the reproduction of conditioned 'passive' avoidance reactions] Tolochko ZS. **Zh Vyssh Nerv Deiat** 1981;31(2):267-70 (Eng. Abstr.) (Rus)

AZEPINES

Pharmacoelectroencephalographic study of brotizolam, a novel hypnotic. Fink M, et al. **Clin Pharmacol Ther** 1981 Sep;30(3):336-42

Disposition of [14C]caprolactam in the rat. Unger PD, et al. **Food Cosmet Toxicol** 1981 Aug;19(4):457-62

Cyclic urea nucleosides. Cytidine deaminase activity as a function of aglycon ring size. Liu PS, et al. **J Med Chem** 1981 Jun;24(6):662-6

Characteristics of equilibrium reaction of zolazepam. Hong WH, et al. **J Pharm Sci** 1981 Jun;70(6):691-3

[Ordram transformation by microorganisms] Golovleva LA, et al. **Izv Akad Nauk SSSR [Biol]** 1981 May-Jun;(3):348-58 (Eng. Abstr.) (Rus)

BEHAVIOR

GABA systems and behavior. Koella WP. **Adv Biochem Psychopharmacol** 1981;29:11-21 (32 ref.)

Age-related behavioral and neurobiological changes: a review with an emphasis on memory. Kubanis P, et al. **Behav Neural Biol** 1981 Feb; 31(2):115-72

Effects of fluoxetine on a specific serotonergic syndrome in rats. Keshavan HJ, et al. **Indian J Med Res** 1981 Apr;73:653-7

[Neurophysiology of anxiety] Debray Q, et al. **Soins Psychiatr** 1981 Mar; (8):3-5 (Fre)

BEHAVIOR, ANIMAL

Central action of adrenaline. Jagiello-Wójtowicz E. **Acta Physiol Pol** 1981 Mar-Apr;32(2):169-80

Effects of intrahypothalamic injections of kainic acid on the behaviour of rats. Plech A, et al. **Acta Physiol Pol** 1981 Mar-Apr;32(2):145-54

Pharmacokinetics and behavioral effects of methylphenidate in Thoroughbred horses. Shults T, et al. **Am J Vet Res** 1981 May; 42(5):722-6

Behavioural recovery following transplantation of substantia nigra in rats subjected to 6-OHDA lesions of the nigrostriatal pathway. I. Unilateral lesions. Dunnett SB, et al. **Brain Res** 1981 Jun 29;215(1-2):147-61

Intrathecal substance P elicits a caudally-directed biting and scratching behavior in mice. Hylden JL, et al. **Brain Res** 1981 Jul 27; 217(1):212-5

Suppression of active sleep by chronic treatment with chlorimipramine during early postnatal development: effects upon adult sleep and behavior in the rat. Mirmiran M, et al. **Brain Res** 1981 Jan 5; 204(1):129-46

Behavioral pharmacology of tetrahydrocannabinol convulsions in rabbits. Consroe P, et al. **Commun Psychopharmacol** 1980;4(4):287-91

Effects of neonatal ACTH4-10 administration on adult adaptive behavior and brain tyrosine hydroxylase activity. Nyakas C, et al. **Dev Neurosci** 1981;4(3):225-32

Endocrine and behavioral effects of continuous exposure of male rats to a potent luteinizing hormone-releasing hormone (LHRH) agonist: evidence for central nervous system actions of LHRH. Dorsa DM, et al. **Endocrinology** 1981 Sep;109(3):729-35

Effect of chronic lithium treatment on isolation-induced behavioral and biochemical effects in mice. Frances H, et al. **Eur J Pharmacol** 1981 Jul 10;72(4):337-41

Effect of L-histidine and chlorcyclizine on apomorphine-induced climbing behaviour and methamphetamine stereotypy in mice. Joshi VV, et al. **Eur J Pharmacol** 1981 Feb 19;69(4):499-502

Behavioral effects of unilateral dopamine injection into dorsal or ventral striatum. Joyce JN, et al. **Eur J Pharmacol** 1981 Jun 10;72(1):1-10

Presence of a particular subpopulation of dopamine receptors within the septal nuclei: a behavioural study on cats. Megens AA, et al. **Eur J Pharmacol** 1981 May 8;71(2-3):247-58

Effects of fluoxetine on a specific serotonergic syndrome in rats. Keshavan HJ, et al. **Indian J Med Res** 1981 Apr;73:653-7

Relevance of the rodent area postrema to dopamine-dependent behavioural effects. Costall B, et al. **J Pharm Pharmacol** 1981 Apr; 33(4):257-9

Behavioral and neurochemical interactions of dextroamphetamine and methylphenidate in rats. Reigle TG, et al. **J Pharm Sci** 1981 Jul; 70(7):816-8

Effects of CDP-choline on striatal dopamine level and behavior in rats. Shibuya M, et al. **Jpn J Pharmacol** 1981 Feb;31(1):47-52

Induction of behavioral supersensitivity to apomorphine by DFP treatment. Davis KL, et al. **Life Sci** 1981 Apr 27;28(17):1953-9

Behavioral comparisons of the stereoisomers of tetrahydrocannabinols. Martin BR, et al. **Life Sci** 1981 Aug 10;29(6):565-74

Behavioral and neurochemical effects of the new opioid peptide dynorphin--(1-13): comparison with other neuropeptides. Zwiers H, et al. **Life Sci** 1981 Jun 1;28(22):2545-51

The effects of muscimol and picrotoxin injections into the cat substantia nigra. Wolfarth S, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Aug;317(1):54-60

Pharmacological characterization of scratching behaviour induced by intracranial injection of substance P and somatostatin. Dobry PJ, et al. **Neuropharmacology** 1981 Mar;20(3):267-72

Behavioral effects of phencyclidine in the developing cat. Levine MS, et al. **Neuropharmacology** 1981 Aug;20(8):743-5

Antagonism of methylphenidate-induced behavior by neostigmine or hemicholinium-3. Ward HE Jr, et al. **Neuropharmacology** 1981 Jul; 20(7):703-9

Reciprocal antagonism between ACTH1-24 and beta-endorphin in rats. Fratta W, et al. **Neurosci Lett** 1981 Jun 12;24(1):71-4

Cardiovascular and behavior changes after ICV infusion of TRH in the conscious goat. Eriksson L, et al. **Pharmacol Biochem Behav** 1981 Jun; 14(6):901-5

Behavioral assessment of norepinephrine and serotonin function and interaction in the hippocampal formation. Gage FH, et al. **Pharmacol Biochem Behav** 1981 Jun;14(6):815-21

Quipazine-induced behavior in neonatal rat pups. Spear LP, et al. **Pharmacol Biochem Behav** 1981 Jun;14(6):831-4

Effects of anorectic drugs and prior feeding on food-rewarded runway behavior. Thurlby PL, et al. **Pharmacol Biochem Behav** 1981 Jun; 14(6):799-804

Melatonin and behavioral thermoregulation in the turtle, Terrapene carolina triunguis. Erskine DJ, et al. **Physiol Behav** 1981 Jun; 26(6):991-4

Effects on central dopaminergic systems of d-coclaurine and d-reticuline, extracted from Magnolia salicifolia. Watanabe H, et al. **Planta Med** 1981 Jul;42(3):213-22

The effect of antidepressants on behavioral despair in rats. Górka Z, et al. **Pol J Pharmacol Pharm** 1980 Jul-Aug;32(4):463-8

The effect of imipramine and mianserin on the behavior and EEG afterdischarges induced by single electric stimulation of the rabbit amygdala. Ossowska K, et al. **Pol J Pharmacol Pharm** 1980 Jul-Aug; 32(4):513-22

Antianxiety agents and emotional behavior, an information processing analysis. Morris MD, et al. **Prog Neuropsychopharmacol** 1981; 5(3):219-40

Enduring behavioural and biochemical effects in the adult rat after prolonged postnatal administration of haloperidol. Cuomo V, et al. **Psychopharmacology (Berlin)** 1981;74(2):166-9

Supersensitivity to L-5-hydroxytryptophan after 5,7-dihydroxytryptamine injections in desmethylimipramine- and nomifensine-pretreated rats: behavioral evidence for postsynaptic supersensitivity. Ortmann R, et al. **Psychopharmacology (Berlin)** 1981; 74(2):109-14

Circadian variation in the head twitch response produced by 5-methoxy-N1,N1-dimethyltryptamine and p-chloroamphetamine in the mouse. Singleton C, et al. **Psychopharmacology (Berlin)** 1981; 74(2):173-6

Evidence against the involvement of serotonergic mechanisms in wet dog shake behavior induced by carbachol chloride in rats. Turski L, et al. **Psychopharmacology (Berlin)** 1981;73(4):376-80

A multivariate analysis of some operant variables used in behavioral pharmacology. Walker CH, et al. **Psychopharmacology (Berlin)** 1981; 74(2):182-6

Seasonal changes in the behavior and plasma titers of various hormones in barheaded geese, Anser indicus. Dittami JP. **Z Tierpsychol** 1981; 55(4):289-324

[Electrographic and behavioral changes induced by the administration of benzodiazepines in the restrained baboon] Rougeul A. **Actual Pharmacol (Paris)** 1981;33:77-90 (Fre)

[Influence of the procedure of administration in the activity of some antidepressant or disinhibiting drugs upon behavioural despair (author's transl)] Scotto di Tella AM, et al. **J Pharmacol** 1981 Apr-Jun; 12(2):179-88 (Eng. Abstr.) (Fre)

BENZAZEPINES

Differential effects of systemic and intracoronary calcium channel blocking agents on global and regional left ventricular function in conscious dogs. Walsh RA, et al. **Am Heart J** 1981 Sep; 102(3 Pt 1):341-50

Properties of 8,9-dichloro-2,3,4,5-tetrahydro-1H-2-benzazepine, an inhibitor of norepinephrine N-methyltransferase. Fuller RW, et al. **Biochem Pharmacol** 1981 Jun 1;30(11):1345-52

Actions of verapamil, diltiazem and other divalent cations on the calcium-current of Helix neurones. Akaike N, et al. **Br J Pharmacol** 1981 Sep;74(1):87-95

Plasma concentration of diltiazem after oral administration in normal volunteers. Koiwaya Y, et al. **Clin Ther** 1981;3(6):436-40

Effects of diltiazem hydrochloride on pressor and steroidogenic actions of angiotensins and norepinephrine in man. Ikeda F, et al. **Endocrinol Jpn** 1980 Dec;27(6):779-84

Inhibitory effect on calcium channel blockers on alpha -adrenergic activation of glycogenolysis and calcium efflux in perfused rat liver. Kimura S, et al. **Endocrinol Jpn** 1981 Feb;28(1):69-78

The pharmacokinetics and pharmacology of oral diltiazem in normal volunteers. Kinney EL, et al. **J Clin Pharmacol** 1981 Aug-Sep; 21(8-9):337-42

The effect of diltiazem and nisoldipine on spontaneously active human atrial tissue. Lathrop DA, et al. **J Mol Cell Cardiol** 1981 Jan; 13(1):111-5

The mechanism of inhibitory action of diltiazem on vascular smooth muscle contractility. van Breemen C, et al. **J Pharmacol Exp Ther** 1981 Aug;218(2):459-63

Effect of diltiazem, a calcium antagonist, on renin secretion from rat kidney slices. Churchill PC, et al. **Life Sci** 1981 Jul 27;29(4):383-9

Diltiazem and verapamil inhibit norepinephrine-stimulated 45Ca uptake in rabbit aorta. Flaim SF, et al. **Pharmacology** 1981;22(5):286-93

[Diltiazem and anaesthesia] Zerr C, et al. **Ann Cardiol Angeiol (Paris)** 1981 Mar-Apr;30(2):133-7 (Fre)

[Electrophysiologic effects of calcium channel blocking agents on the sinus node function in anesthetized dogs (author's transl)] Nakaya H, et al. **Nippon Yakurigaku Zasshi** 1980 Nov;76(8):697-707 (Eng. Abstr.) (Jpn)

[Effects of diltiazem on cardiac function in the dog (author's transl)] Narita H, et al. **Nippon Yakurigaku Zasshi** 1981 Jan;77(1):51-9 (Eng. Abstr.) (Jpn)

BENZODIAZEPINE TRANQUILIZERS

Effect of estazolam on the caudate spindle in the cat. Janicki P, et al. **Act Nerv Super (Praha)** 1981 Jun;23(2):172-3

Studies with excitatory amino acid antagonists in rat CNS: 2-amino-5-phosphonovaleric acid, phenytoin, and benzodiazepines. Stone TW. **Adv Biochem Psychopharmacol** 1981;29:223-30

Cimetidine-benzodiazepine drug interaction. Ruffalo RL, et al. **Am J Hosp Pharm** 1981 Sep;38(9):1365-6

Benzodiazepines--panacea or poison? Lader M. **Aust NZ J Psychiatry** 1981 Mar;15(1):1-9

Stimulation of benzodiazepine binding to rat brain membranes and solubilized receptor complex by avermectin B1a and gamma-aminobutyric acid. Pong SS, et al. **Biochim Biophys Acta** 1981 Aug 6;646(1):143-50

Withdrawal from long-term benzodiazepine treatment. Petursson H, et al. **Br Med J [Clin Res]** 1981 Sep 5;283(6292):643-5

Benzodiazepine binding and interactions with the GABA receptor complex in living cultures of rat cerebral cortex. White WF, et al. **Brain Res** 1981 Jun 29;215(1-2):162-76

More on lorazepam withdrawal [letter] Barton DF. **Drug Intell Clin Pharm** 1981 Feb;15(2):134

Alprazolam (Xanax, the Upjohn Company). Evans RL. **Drug Intell Clin Pharm** 1981 Sep;15(9):633-8

Effect of a short-acting benzodiazepine on brain electrical activity during sleep. Johnson LC, et al. **Electroencephalogr Clin Neurophysiol** 1981 Jul;52(1):89-97

Action of pyrazolopyridines as modulators of [3H]flunitrazepam binding to the gaba/benzodiazepine receptor complex of the cerebellum. Supavilai P, et al. **Eur J Pharmacol** 1981 Mar 12;70(2):183-93

Neurochemical changes produced by acute treatment with clobazam, a new 1,5-benzodiazepine. Lapierre YD, et al. **Gen Pharmacol** 1981; 12(4):261-6

Assay of triazolam in plasma by capillary gas chromatography. Jochemsen R, et al. **J Chromatogr** 1981 May 8;223(2):438-44

Determination of tofisopam in serum by high-performance liquid chromatography. Sajgó M, et al. **J Chromatogr** 1981 Feb 13; 222(2):303-7

Multicenter double-blind efficacy and safety study comparing alprazolam, diazepam and placebo in clinically anxious patients. Cohn JB. **J Clin Psychiatry** 1981 Sep;42(9):347-51

Lack of effect of benzodiazepines on bicuculline-insensitive GABA-receptors in the field-stimulated guinea-pig vas deferens preparation. Doble A, et al. **J Pharm Pharmacol** 1981 Apr; 33(4):267-8

High-performance liquid chromatographic analysis of clorazepate dipotassium and monopotassium in solid dosage forms. Elrod L Jr, et al. **J Pharm Sci** 1981 Jul;70(7):793-5

Benzodiazepines reduce stress-augmented increase in rat urine monoamine oxidase inhibitor. Glover V, et al. **Nature** 1981 Jul 23; 292(5821):347-9

Benzodiazepine dependence: a general practice survey. Khan A, et al. **NZ Med J** 1981 Jul 8;93(687):19-21

Preliminary studies on the central action of new 1,5-benzodiazepine derivatives. Kleinrok Z, et al. **Pol J Pharmacol Pharm** 1980 May-Jun; 32(3):247-60

Beta-adrenoreceptor antagonists enhance the benzodiazepine-induced suppression of footshock induced fighting in mice. Rolinski Z, et al. **Pol J Pharmacol Pharm** 1980;32(5):731-8

The effect of chronic diazepam treatment on discrimination performance and 3H-flunitrazepam binding in the brains of shocked and nonshocked rats. Grimm VE, et al. **Psychopharmacology (Berlin)** 1981; 74(2):132-6

The halcion affair [letter] Rudnick HL. **S Afr Med J** 1981 Sep 5; 60(10):378

[Electrographic and behavioral changes induced by the administration of benzodiazepines in the restrained baboon] Rougeul A. **Actual Pharmacol (Paris)** 1981;33:77-90 (Fre)

[Comparative pharmacokinetics of diazepam and flunitrazepam] Cano JP, et al. **Ann Anesthesiol Fr** 1981;22(2):175-9 (Eng. Abstr.) (Fre)

[Clinical pharmacokinetics of flunitrazepam (Nacrozep) in intensive care patient (preliminary results)] Sumirtapura Y, et al. **Ann Anesthesiol Fr** 1981;22(2):180-4 (Eng. Abstr.) (Fre)

[Pharmacological and toxicological aspects of benzodiazepine compounds (author's transl)] Kapp W. **Anaesth Intensivther Notfallmed** 1981 Jun; 16(3):125-7 (Eng. Abstr.) (Ger)

[Clinical pharmacokinetics of midazolam, flunitrazepam and diazepam (author's transl)] Lauven PM, et al. **Anaesth Intensivther Notfallmed** 1981 Jun;16(3):135-42 (Eng. Abstr.) (Ger)

[The use of flunitrazepam in ICU patients (author's transl)] Pasch T. **Anaesth Intensivther Notfallmed** 1981 Jun;16(3):145-9 (Eng. Abstr.) (Ger)

[Molecular mechanism of action of benzodiazepines] Quast U. **Fortschr Med** 1981 May 28;99(20):788-94 (Eng. Abstr.) (Ger)

BENZODIAZEPINONES

Clonazepam acetylation in fast and slow acetylators. Miller ME, et al. **Clin Pharmacol Ther** 1981 Sep;30(3):343-7

Metabolism of pinazepam by rat liver microsomes. Marcucci F, et al. **Eur J Drug Metab Pharmacokinet** 1981;6(2):109-14

Neurochemical changes produced by acute treatment with clobazam, a new 1,5-benzodiazepine. Lapierre YD, et al. **Gen Pharmacol** 1981; 12(4):261-6

Structure of tomaymycin, a DNA binding antitumor antibiotic. Arora SK. **J Antibiot (Tokyo)** 1981 Apr;34(4):462-4

Benzodiazepine antagonist Ro 15-1788: binding characteristics and interaction with drug-induced changes in dopamine turnover and cerebellar cGMP levels. Möhler H, et al. **J Neurochem** 1981 Sep; 37(3):714-22

[New evidence for a GABA-ergic component in the mechanism of action of benzodiazepine tranquilizers] Zakusov VV, et al. **Biull Eksp Biol Med** 1981 May;91(5):571-4 (Eng. Abstr.) (Rus)

[Stimulation of prostaglandin E2 and F2a biosynthesis in the brains of mouse strain F1 (CBA X C57BL) by the tranquilizer phenazepam] Romantsev EF, et al. **Dokl Akad Nauk SSSR** 1981;258(1):239-42 (Rus)

[Dynamics of phenazepam concentration in the blood of pregnant mini-swine] Liubimov BI, et al. **Farmakol Toksikol** 1981 Jan-Feb; 44(1):43-6 (Eng. Abstr.) (Rus)

[Effect of stimulants on the tranquilizing, hypnotic and myorelaxant action of phenazepam] Voronina TA, et al. **Farmakol Toksikol** 1981 Mar-Apr; 44(2):155-9 (Eng. Abstr.) (Rus)

[Inhibitory effect of phenazepam on protein and RNA catabolism in the supraoptic nucleus during REM-sleep deprivation] Demin NN, et al. **Fiziol Zh SSSR** 1981 Mar;67(3):460-3 (Rus)

BIOGENIC AMINES

Effect of cholecystokinin octapeptide sulphate ester on brain monoamines in the rat. Fekete M, et al. **Acta Physiol Acad Sci Hung** 1981; 57(1):37-46

In vivo effect of danitracen on the uptake mechanism in monoaminergic neurons and platelets in rats. Wielosz M, et al. **Agressologie** 1979; 20(D):253-7

Combined thin-layer chromatography/mass spectrometry without substance elution. Use of direct identification of phenols, steroids, nucleosides, biogenic amines, and amino acids. Kraft R, et al. **Anal Biochem** 1981 May 1;113(1):193-6

Comparative histochemistry as a springboard for the discovery of biogenic amines and active peptides in molluscan tissues and amphibian skin. Erspamer V. **Basic Appl Histochem** 1981;25(1):3-14

Biogenic amine terminals in the goldfish cerebellum and optic tectum: a fluorescence and autoradiographic study. Niso R, et al. **Basic Appl Histochem** 1981;25(2):113-9

Characterization of eight biogenic indoleamines as substrates for type A and type B monoamine oxidase. Suzuki O, et al. **Biochem Pharmacol** 1981 Jun 1;30(11):1353-8

Detection of urinary primary amines through negative chemical ionization mass spectrometry of fluorescamine derivatives. Bergner EA, et al. **Biomed Mass Spectrom** 1981 May;8(5):208-10

Biogenic amines and the secretion of parathyroid hormone and calcitonin. Heath H 3d. **Endocr Rev** 1980 Fall;1(4):319-38 (141 ref.)

Gas chromatographic determination of some biogenic amines as their pentafluorobenzoyl derivatives in the picogram range and its applicability to biological materials. Bock UE, et al. **J Chromatogr** 1981 Sep 4;213(3):413-28

High-performance liquid chromatographic determination of biogenic amines. II. Comparison of detection methods. Svendsen H, et al. **J Chromatogr** 1981 Sep 4;213(3):429-37

Determination of picomole amounts of dopamine, noradrenaline, 3,4-dihydroxyphenylalanine, 3,4-dihydroxyphenylacetic acid, homovanillic acid, and 5-hydroxyindolacetic acid in nervous tissue after one-step purification on Sephadex G-10, using high-performance liquid chromatography with a novel type of electrochemical detection. Westerink BH, et al. **J Neurochem** 1981 Apr;36(4):1449-62

Red blood cells: in vivo site for transport and inactivation of biogenic amines in man and rats. Alexander N, et al. **Life Sci** 1981 Aug 3; 29(5):477-82

Effects of antidepressant treatment with clomipramine on hormonal responses to thyrotropin-releasing hormone and insulin-induced hypoglycemia: implications for the 'monoamine-hypothesis'. Langer G, et al. **Pharmacopsychiatria** 1981 May;14(3):100-6

[Biogenic amines and biological control] **Tanpakushitsu Kakusan Koso** 1981 Jul;26(9 Suppl):1065-484 (Jpn)

[Progress in biochemical studies for biogenic amines] **Tanpakushitsu Kakusan Koso** 1981 Jul;26(9 Suppl):1071-288 (Jpn)

[Metabolism of biogenic amines and related enzymes] **Tanpakushitsu Kakusan Koso** 1981 Jul;26(9 Suppl):1289-484 (Jpn)

[Changes in the levels of adrenergic and serotoninergic indices in patients with depressive states] Misionzhnik EIu, et al. **Zh Nevropatol Psikhiatr** 1981;81(4):543-51 (Eng. Abstr.) (Rus)

BIPOLAR DISORDER

Lithium capsule. Holland PJ. **Am Fam Physician** 1981 Sep;24(3):147-8

Group therapy in the management of manic-depressive illness. Volkmar FR, et al. **Am J Psychother** 1981 Apr;35(2):226-34

Prophylactic lithium carbonate with and without imipramine for bipolar 1 patients. A double-blind study. Quitkin FM, et al. **Arch Gen Psychiatry** 1981 Aug;38(8):902-7

Practical guide-lines of lithium prophylaxis. Kerry RJ. **Bibl Psychiatr** 1981;(161):197-205

Differential sensitivity to the effects of psychotropic drugs: psychotics vs normals; Asian vs Western populations. Okuma T. **Folia Psychiatr Neurol Jpn** 1981;35(1):79-87

Bipolar affective disorder, lithium carbonate and Ca++ ATPase. Choi SJ, et al. **J Affective Disord** 1981 Jun;3(2):77-9

Bipolar affective disorder following coronary bypass surgery. Salinger R, et al. **J Clin Psychiatry** 1981 Sep;42(9):354-5

Manic depression—a disorder of central dopaminergic rhythm. Skutsch GM. **Med Hypotheses** 1981 Jun;7(6):737-46

Cell membrane anomaly in genetically determined manic-depressive illness. Verbanck PM, et al. **Neuropsychobiology** 1981;7(4):185-7

Leukocytosis during long-term lithium treatment. Yassa R. **NY State J Med** 1981 Sep;81(10):1479-80

[Manic-depressive psychosis. Efficacy of lithium in various disorders of carbohydrate metabolism (letter)] Gisselmann A, et al. **Nouv Presse Med** 1981 Jun 6;10(25):2121 (Fre)

[Lithium] Lemoine JM, et al. **Soins Psychiatr** 1981 Jan;(7):37-42 (Fre)

[Emotional stress and biochemical responses of completely recovered manic depressive patients (author's transl)] Nakahara T. **Seishin Shinkeigaku Zasshi** 1981;83(5):263-74 (Jpn)

[Slow-release lithium carbonate versus standard preparation in bipolar affective disorders (author's transl)] Bohaček N, et al. **Lijec Vjesn** 1980 Oct;102(10):575-9 (Eng. Abstr.) (Ser)

BLOOD-BRAIN BARRIER

Blood-brain transport of tryptophan and phenylalanine: effect of portacaval shunt in dogs. Huet PM, et al. **Am J Physiol** 1981 Aug; 241(2):G163-9

BOREDOM

The stress of boredom and monotony: a consideration of the evidence. Thackray RI. **Psychosom Med** 1981 Apr;43(2):165-76

BRADYKININ

Effects of high oxygen tension on the metabolism of vasoactive hormones in isolated perfused rat lungs. Toivonen H, et al. **Acta Physiol Scand** 1981 Feb;111(2):185-92

Bradykinin effects on adrenergic transmission in the canine kidney: relation to prostaglandins. Sušić H, et al. **Am J Physiol** 1981 Sep; 241(3):R146-51

Enkephalins, substance P, bradykinin and angiotensin II: differential sites of action on the hypothalamo-neurohypophysial system. Baertschi AJ, et al. **Brain Res** 1981 Sep 7;220(1):107-19

Thermoregulatory effects of centrally administered bombesin, bradykinin, and methionine-enkephalin. Francesconi R, et al. **Brain Res Bull** 1981 Jul;7(1):63–8

Inhibitory action of bradykinin on release of the adrenergic transmitter in the isolated lapine kidney. Malik KU, et al. **Experientia** 1981 May 15;37(5):496–7

BUTYLAMINES

Superiority of perfluorocarbon cardioplegia over blood or crystalloid cardioplegia. Kanter KR, et al. **Circulation** 1981 Aug; 64(2 Pt 2):75–80

Maintenance of rat liver viability enhanced by cold flushing with oxygenated perfluorochemicals. Konno T, et al. **Jpn J Surg** 1981; 11(3):209–13

BUTYROPHENONE TRANQUILIZERS

Influence of beta-adrenergic and cholinergic blockade on the electrophysiological effects of melperone in the dog heart in situ. Platou ES, et al. **Cardiovasc Res** 1981 Mar;15(3):137–43

Electrophysiological effects of melperone in the dog heart in situ - a new antiarrhythmic drug. Refsum H, et al. **Cardiovasc Res** 1981 Mar; 15(3):131–6

BUTYROPHENONES

Overall-response parameter analysis applied to butyrophenones. Mager PP. **Act Nerv Super (Praha)** 1981 Jun;23(2):130–5

Differential effects of itanoxone—a new hypolipidemic and hypouricemic drug—on platelet and vascular prostaglandin generation in rats. Livio M, et al. **Atherosclerosis** 1981 Jul;39(4):469–77

The interaction of chlorpromazine and butyrophenones with glutamate dehydrogenase. Tamir A, et al. **Biochem Pharmacol** 1981 Jun 15; 30(12):1469–73

[3H]Spiperone binding sites in brain: autoradiographic localization of multiple receptors. Palacios JM, et al. **Brain Res** 1981 Jun 1; 213(2):277–89

Influence of beta-adrenergic and cholinergic blockade on the electrophysiological effects of melperone in the dog heart in situ. Platou ES, et al. **Cardiovasc Res** 1981 Mar;15(3):137–43

Electrophysiological effects of melperone in the dog heart in situ - a new antiarrhythmic drug. Refsum H, et al. **Cardiovasc Res** 1981 Mar; 15(3):131–6

Kainic acid lesions dissociate [3H] spiperone and [3H]cis-flupenthixol binding sites in rat striatum. Cross AJ, et al. **Eur J Pharmacol** 1981 May 8;71(2–3):327–32

Decreased in vivo [3H]spiroperidol binding in rat brain after repeated methamphetamine administration. Kaneno S, et al. **Eur J Pharmacol** 1981 Jun 10;72(1):101–5

Comparisons of rotamer populations of nialamide, azaperone, and chloroquine in solid state and in solution. Migliaccio GP, et al. **J Pharm Sci** 1981 Mar;70(3):284–7

Specific in vivo binding of 77Br-p-bromospiroperidol in rat brain: a potential tool for gamma ray imaging. Kulmala HK, et al. **Life Sci** 1981 Apr 27;28(17):1911–6

Effects of chronic haloperidol, thioridazine and zotepine treatment on apomorphine elicited stereotypic behavior and 3H-spiroperidol binding sites in the striatum of the rat. Lai HC, et al. **Proc West Pharmacol Soc** 1981;24:5–6

Lithium increases serotonin release and decreases serotonin receptors in the hippocampus. Treiser SL, et al. **Science** 1981 Sep 25; 213(4515):1529–31

CARBAMAZEPINE

Carbamazepine overdose. Lehrman SN, et al. **Am J Dis Child** 1981 Aug; 135(8):768–9

Saliva carbamazepine and phenytoin level monitoring. Rylance GW, et al. **Arch Dis Child** 1981 Aug;56(8):637–40

Rapid and sensitive high-pressure liquid chromatographic method for monitoring carbamazepine levels in serum. Furlanut M, et al. **Br J Clin Pharmacol** 1981 Apr;11(4):393–5

Comparison of anticonvulsant potencies of cyheptamide, carbamazepine, and phenytoin. Jones GL, et al. **J Pharm Sci** 1981 Jun;70(6):618–20

Competitive nephelometric immunoassay of carbamazepine and its epoxide metabolite in patient blood plasma. Nishikawa T, et al. **J Pharmacobiodyn** 1981 Jan;4(1):77–83

Carbamazepine poisoning: treatment by hemoperfusion. Gary NE, et al. **Nephron** 1981;27(4–5):202–3

An unexpected reaction to carbamazepine. Taylor MW, et al. **Practitioner** 1981 Feb;225(1352):219–20

Effect of carbamazepine on CSF opioid activity; relationship to antidepressant response. Post RM, et al. **Psychiatry Res** 1981 Aug; 5(1):59–66

[Carbamazepine poisoning] Krarup G, et al. **Ugeskr Laeger** 1981 Mar 2; 143(10):603–6 (Eng. Abstr.) (Dan)

[Carbamazepine (Tegretol) poisoning)] Wernberg M, et al. **Ugeskr Laeger** 1981 Mar 2;143(10):619–20 (Eng. Abstr.) (Dan)

[Pharmacological influences on the brain level and transport of GABA. I) Effect of various antipileptic drugs on brain levels of GABA] Varotto M, et al. **Boll Soc Ital Biol Sper** 1981 Apr 30;57(8):904–8 (Eng. Abstr.) (Ita)

CARBIDOPA

Effects of benserazide and carbidopa on the metabolism of L-tryptophan by isolated rat liver cells. Smith SA, et al. **Biochem Pharmacol** 1981 Mar 15;30(6):623–8

CATECHOLAMINES

Release of endogenous GABA from the rat brain: methodological aspects and the effects of catecholamines. van der Heyden JA, et al. **Adv Biochem Psychopharmacol** 1981;29:193–203

Stimulatory and inhibitory effects of catecholamines and of prostaglandin E2 on human fat cell adenylate cyclase. Kather H, et al. **Adv Cyclic Nucleotide Res** 1981;14:555–62

Role of guanine nucleotides in hormonal activation of adenylate cyclase. Selinger Z, et al. **Adv Cyclic Nucleotide Res** 1981;14:15–22

Peripheral metabolism of indoleamines and catecholamines in endogenous depressive syndrome. Puzynski S, et al. **Agressologie** 1979; 20(D):245–51

Stability of five catecholamines and terbutaline sulfate in 5% dextrose injection in the absence and presence of aminophylline. Newton DW, et al. **Am J Hosp Pharm** 1981 Sep;38(9):1314–9

Exercise plasma catecholamines in dogs: role of adrenals and cardiac nerve endings. Péronnet F, et al. **Am J Physiol** 1981 Aug;241(2):H243–7

A cellular activator of catecholamine-sensitive adenylate cyclase in rat reticulocytes and erythrocytes: changes during reticulocyte development and effects on the beta receptor. Shane E, et al. **Arch Biochem Biophys** 1981 May;208(2):418–25

The influence of sodium gamma-hydroxybutyrate on GABA receptors and catecholamine effect potentiation. Kozhechkin SN. **Arch Int Pharmacodyn Ther** 1981 Apr;250(2):242–53

Effects of Mg-pemoline on the central catecholaminergic system. Molina VA, et al. **Arch Int Pharmacodyn Ther** 1981 May;251(1):66–79

Catecholamine levels and tyrosine hydroxylase activities in rat brain regions after chronic treatment with, and withdrawal of, methamphetamine. Bardsley ME, et al. **Biochem Pharmacol** 1981 Jun 15;30(12):1543–9

Influence of harmaline on the ability of pargyline to alter catecholamine metabolism in rats. Fuller RW, et al. **Biochem Pharmacol** 1981 Jun 1; 30(11):1295–8

Catecholamine-induced phosphorylation of cardiac muscle proteins. Dobson JG Jr. **Biochim Biophys Acta** 1981 Jun 11;675(1):123–31

High performance liquid chromatographic analysis of catecholamines in growing and non-growing Tetrahymena pyriformis. Goldman ME, et al. **Biochim Biophys Acta** 1981 Aug 17;676(2):221–5

Plasma catecholamines and pituitary adrenal hormones related to mental task demand under quiet and noise conditions. Brandenberger G, et al. **Biol Psychol** 1980 Jun;10(4):239–52

Evidence against an obligatory role for catecholamine release or prostacyclin synthesis in the effects of relaxin on the rat uterus. Sanborn BM, et al. **Biol Reprod** 1981 Jun;24(5):987–92

Prostacyclin and beta-adrenergic catecholamines inhibit arachidonate release and PGI2 synthesis by vascular endothelium. Adler B, et al. **Blood** 1981 Sep;58(3):514–7

Cell groups in the lower brain stem of the rabbit projecting to the spinal cord, with special reference to catecholamine-containing neurons. Blessing WW, et al. **Brain Res** 1981 Sep 21;221(1):35–55

Effect of manipulating central catecholamines on puberty and the surge of luteinizing hormone and gonadotropin releasing hormone induced by pregnant mare serum gonadotropin in female rats. Sarkar DK, et al. **Brain Res** 1981 Jun 1;213(2):335–49

Changes in dopamine and DOPAC following systemic administration of apomorphine and 3,4-dihydroxyphenylamino-2-imidazoline (DPI) in rats. Springer J, et al. **Brain Res** 1981 Sep 7;220(1):226–30

Effects of serotonin and catecholamines on RNA synthesis in planarians; in vitro and in vivo studies. Franquinet R, et al. **Cell Differ** 1981 Aug; 10(4):201–9

Projection of ventrolateral medullary (A1) catecholamine neurons toward nucleus tractus solitarii. Blessing WW, et al. **Cell Tissue Res** 1981; 220(1):27–40

Corticotropin-releasing factors (CRF) secreted by the rat median eminence in vitro in the presence or absence of ascorbic acid: quantitative role of vasopressin and catecholamines. Bény JL, et al. **Endocrinology** 1981 Sep;109(3):813–7

Characteristics of the alpha-adrenergic stimulation of adrenocorticotropin secretion in rat anterior pituitary cells. Giguere V, et al. **Endocrinology** 1981 Sep;109(3):757–62

Role of phosphorylation of the sarcoplasmic reticulum in the cardiac response to catecholamines. Katz AM. **Eur Heart J** 1980; Suppl A:29–33 (23 ref.)

Catecholaminergic involvement in the biphasic effect of ADATN on temperature in mice. Dooley DJ, et al. **Eur J Pharmacol** 1981 May 8;71(2-3):269-76

Effect of prostaglandins D2, E2 and F2alpha on catecholamine release from slices of rat and rabbit brain. Reimann W, et al. **Eur J Pharmacol** 1981 Feb 19;69(4):421-7

Effect of captopril on cardiovascular, sympathetic and vasopressin responses to hemorrhage. Zerbe RL, et al. **Eur J Pharmacol** 1981 Jul 10;72(4):391-5

Gonadal steroids and brain monoamines: how do they interact? Wuttke W, et al. **Exp Brain Res** 1981;Suppl 3:130-41

Density of retinal catecholamine-accumulating cells in different-sized goldfish. Negishi K. **Exp Eye Res** 1981 Aug;33(2):223-32

Swim-stress induced changes of rat adrenal catecholamine level depending on metabolic state and different ambient temperature. Bargiel Z, et al. **Folia Histochem Cytochem (Krakow)** 1981;19(1):31-7

Plasma catecholamines: effects of footshock level and hormonal modulators of memory storage. McCarty R, et al. **Horm Behav** 1981 Jun;15(2):168-82

Stimulation of cyclic AMP production by vasoactive agents in cultured bovine aortic and pulmonary artery endothelial cells. Makarski JS. **In Vitro** 1981 May;17(5):450-8

Heterogeneity in the adrenomedullary storage of catecholamines, ATP, calcium and releasable dopamine beta-hydroxylase activity. Bolstad G, et al. **J Auton Nerv Syst** 1980 Dec;2(4):337-54

Tonic catecholaminergic inhibition of the spinal somato-sympathetic reflexes originating in the ventrolateral medulla oblongata. Dembowsky K, et al. **J Auton Nerv Syst** 1981 Apr;3(2-4):277-90

Effects of some catecholamines on the cat cardiovascular system: interactions with adrenoceptor antagonists. McPherson GA, et al. **J Cardiovasc Pharmacol** 1981 Jul-Aug;3(4):739-52

Determination of catecholamines by radioenzymatic assay using ion-pair liquid chromatography. Uchikura K, et al. **J Chromatogr** 1981 Apr 10;223(1):41-50

Cyclic adenosine monophosphate modulation of contractility via slow Ca2+ channels in chick heart. Azuma J, et al. **J Mol Cell Cardiol** 1981 Jun;13(6):577-87

Muscarinic receptors in chromaffin cell cultures mediate enhanced phospholipid labeling but not catecholamine secretion. Fisher SK, et al. **J Neurochem** 1981 Aug;37(2):491-7

Stimulus-secretion coupling in isolated adrenal chromaffin cells: calcium channel activation and possible role of cytoskeletal elements. Schneider AS, et al. **J Neurochem** 1981 Sep;37(3):567-75

On the role of Ca2+ in the transmitter choice made by cultured sympathetic neurons. Walicke PA, et al. **J Neurosci** 1981 Apr;1(4):343-50

Immobility test: effects of 5-hydroxytryptaminergic drugs and role of catecholamines in the activity of some antidepressants. Borsini F, et al. **J Pharm Pharmacol** 1981 Jan;33(1):33-7

Age-related changes in the central catecholaminergic function and its interaction with methamphetamine during postnatal life in the rat. Nomura Y, et al. **J Pharm Pharmacol** 1981 Apr;33(4):264-6

Physiological role of endogenous amines in the modulation of ventricular automaticity in the guinea-pig. Hume J, et al. **J Physiol (Lond)** 1980 Dec;309:275-86

Nitroglycerine and catecholamine actions on smooth muscle cells of the canine coronary artery. Ito Y, et al. **J Physiol (Lond)** 1980 Dec;309:171-83

Studies on secretion of catecholamines evoked by acetylcholine or transmural stimulation of the rat adrenal gland. Wakade AR. **J Physiol (Lond)** 1981;313:463-80

Facilitation of secretion of catecholamines from rat and guinea-pig adrenal glands in potassium-free medium or after ouabain. Wakade AR. **J Physiol (Lond)** 1981;313:481-98

Stress and age effects on catecholamines in normal subjects. Aslan S, et al. **J Psychosom Res** 1981;25(1):33-41

Influence of sino-aortic baroreceptor denervation on catecholamines, catecholamine-synthesizing enzymes and choline acetyltransferase activity in the brainstem nuclei of the rat. Nakamura K, et al. **Jpn J Pharmacol** 1981 Feb;31(1):95-105

Catecholamine biosynthesis in specific brain areas of the rat as determined by liquid chromatography and amperometric detection. Bennett BA, et al. **Life Sci** 1981 Jun 22;28(25):2811-7

Adrenal catecholamines during and following hypoxia in neonatal rats. Hedner T, et al. **Med Biol** 1980 Aug;58(4):228-31

Increase in catecholamine-stimulated cyclic AMP and progesterone synthesis in rat granulosa cells during culture. Kliachko S, et al. **Mol Cell Endocrinol** 1981 Jul;23(1):23-32

Catecholamines, dopamine, and endorphin levels during extreme exercise [letter] Bortz WM 2d, et al. **N Engl J Med** 1981 Aug 20;305(8):466-7

Liberation of catecholamines and 5-hydroxytryptamine from human blood-platelets. Peyer M, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Feb;316(1):81-6

Endogenous dopa in rat brain. Occurrence, distribution and relationship to changes i catecholamine synthesis. Thiede HM, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Jul;316(4):299-303

Catecholamines in the hypothalamus: an anatomical review. Palkovits M. **Neuroendocrinology** 1981 Aug;33(2):123-8

Scattered catecholaminergic cells in the dorsolateral tegmentum caudal to locus coeruleus in cat. Persson M, et al. **Neurosci Lett** 1981 May 29;23(3):275-80

alpha-MSH, MIF-I and melatonin: effects on novelty-induced defecation, plasma 11-OHCS and central catecholamines in rats. Datta PC, et al. **Peptides (Fayetteville)** 1981;2 Suppl 1:143-54

Presynaptic regulation of the release of catecholamines. Langer SZ. **Pharmacol Rev** 1980 Dec;32(4):337-62

Humoral indices of stress in rats. Natelson BH, et al. **Physiol Behav** 1981 Jun;26(6):1049-54

The effect of multiple imipramine administration on monoaminergic systems of the rat brain. Vetulani J, et al. **Pol J Pharmacol Pharm** 1980 Jul-Aug;32(4):523-30

Effect of acute or chronic pentobarbital administration on the steady state levels and the turnover rates of catecholamines in discrete brain areas of mice. Nabeshima T, et al. **Prog Neuropsychopharmacol** 1981;5(2):121-8

Stimulatory effect of ouabain on catecholamine synthesis in bovine adrenal medullary slices. Yanagihara N. **Tokushima J Exp Med** 1980 Dec;27(3-4):63-8

[Plasma catecholamines and aerobic-anaerobic capacity in women during graduated treadmill exercise] Lehmann M, et al. **Eur J Applied Physiol** 1981;46(3):305-15 (Ger)

[Behavior of plasma catecholamines in relation to pressure changes induced with hemodialysis or ultrafiltration] Cannella G, et al. **Minerva Nefrol** 1979 Jul-Sep;26(3):365-72 (Ita)

[Effects of GSH on endocrine function and lysosomal enzyme levels during cardiopulmonary bypass in man (author's transl)] Matsuki A, et al. **Masui** 1981 Feb;30(2):150-7 (Eng. Abstr.) (Jpn)

[Catecholamines and potassium metabolism] Hishida A, et al. **Nippon Rinsho** 1981 Feb;39(2):304-9 (29 ref.) (Jpn)

[Studies on new radioenzymatic assay kit for catecholamine determination and plasma levels of catecholamines (author's transl)] Nakai T, et al. **Rinsho Byori** 1980 Sep;28(9):915-9 (Jpn)

[Metabolism of peripheral catecholamines and indole amines in healthy persons. Clinico-biochemical correlates] Krzyżowski J, et al. **Pol Tyg Lek** 1981 Mar 16;36(11):417-21 (Eng. Abstr.) (Pol)

[Correlation between the body's level of carbohydrates and the neurohormonal response to exercise in man] Nazar K. **Pol Tyg Lek** 1981 May 18;36(20):735-7 (Pol)

[Cerebral bioelectric activity and urinary catecholamine elimination in thermal stress in children] Stratone A, et al. **Rev Med Chir Soc Med Nat Iasi** 1981;85(1):113-6 (Eng. Abstr.) (Rum)

[Use of aluminum-formaldehyde to demonstrate catecholamines in cryostatic sections] Azhialis VP, et al. **Arkh Anat Gistol Embriol** 1981 Mar;80(3):102-6 (Rus)

[Luminescent-histochemical study of the effect of atropine and dimethoxydichlorvinylphosphate on catecholamine concentration in certain rat brain structures] Kutsenko SA, et al. **Biull Eksp Biol Med** 1981 Jun;91(6):702-3 (Eng. Abstr.) (Rus)

[Effect of acetylcholine and histamine on electrolyte and catecholamine content of vessel walls exposed to x-rays and cystamine] Litvinov SA. **Farmakol Toksikol** 1981 Jan-Feb;44(1):55-9 (Eng. Abstr.) (Rus)

[Role of the kallikrein-kinin system in achieving the hemodynamic effects of catecholamines] Kiselev VI, et al. **Fiziol Zh SSSR** 1981 Apr;67(4):561-7 (Eng. Abstr.) (Rus)

[Catecholamines and the enzymes of their synthesis in the adrenal medulla of rats after a flight on the Cosmos-936 biosatellite] Kwietnanski R, et al. **Kosm Biol Aviakosm Med** 1981 Jun-Jul;15(4):64-5 (Eng. Abstr.) (Rus)

[Catecholamine metabolic state in the early stages of the development of chronic carbon disulfide poisoning (a review of the literature)] Lukhtai VA. **Vrach Delo** 1981 May;(5):110-4 (33 ref.) (Eng. Abstr.) (Rus)

[Identification of the catecholamines in tissue extracts of the trematode, Fasciola hepatica] Terenina NB. **Zh Evol Biokhim Fiziol** 1981 Jul-Aug;17(4):342-7 (Eng. Abstr.) (Rus)

CENTRAL NERVOUS SYSTEM AGENTS

Monophenolic 2-(dipropylamino)indans and related compounds: central dopamine-receptor stimulating activity. Hacksell U, et al. **J Med Chem** 1981 Apr;24(4):429-34

CHILD BEHAVIOR DISORDERS

The hyperactive child in adolescence: some pharmacologic approaches. White JH. **J Adolesc** 1981 Mar;4(1):79-86

Double-blind assessment of the activity of minaprine (30038-CB) in child psychiatry. Maffia AG. **Pharmatherapeutica** 1981;2(9):601-6

CHILD DEVELOPMENT DISORDERS, PERVASIVE

Use of stimulant medication in treating pervasive developmental disorder [letter] Sporn A, et al. **Am J Psychiatry** 1981 Jul;138(7):997

CHLORAMINES

The effect of the oxidizing agents chloramine-T and cigarette smoke on dog serum proteinase inhibitor(s). Abrams WR, et al. **Exp Lung Res** 1980 Aug;1(3):211-23

Investigations concerning the action of serveral chemical and biological agents on HBsAg. Morfei A, et al. **Virologie** 1980 Oct-Dec; 31(4):273-8

CHLORDIAZEPOXIDE

Hostility conflict and the effect of chlordiazepoxide on change in hostility level. Downing RW, et al. **Compr Psychiatry** 1981 Jul-Aug; 22(4):362-7

Lack of tolerance and rapid recovery of cimetidine-inhibited chlordiazepoxide (Librium) elimination. Patwardhan RV, et al. **Gastroenterology** 1981 Sep;81(3):547-51

Differential pulse amperometric detection of drugs in plasma using a dropping mercury electrode as a high-performance liquid chromatographic detector. Hackman MR, et al. **J Chromatogr** 1981 Feb 13;222(2):179-90

Benzodiazepines reduce stress-augmented increase in rat urine monoamine oxidase inhibitor. Glover V, et al. **Nature** 1981 Jul 23; 292(5821):347-9

Effects of morphine and chlordiazepoxide on avoidance behaviour in two inbred strains of mice. Cuomo V, et al. **Neuropharmacology** 1981 Mar; 20(3):301-4

The partial reinforcement extinction effect: influence of chlordiazepoxide in septal lesioned rats. Feldon J, et al. **Psychopharmacology (Berlin)** 1981; 74(3):280-9

P-CHLOROPHENYLALANINE

Diffuse noxious inhibitory controls (DNIC) in the rat with or without pCPA pretreatment. Dickenson AH, et al. **Brain Res** 1981 Jul 20; 216(2):313-21

Phasic activity induced by p-chlorophenylalanine in the auditory pathway. Ayala-Guerrero F, et al. **Neuropharmacology** 1981 Mar; 20(3):273-5

Modifications of brain steroidogenesis and plasma steroids after p-chlorophenylalanine-methyl-ester treatment in male rats and rabbits. Farabollini F, et al. **Pharmacol Biochem Behav** 1981 Jun;14(6):911-4

Does para-chlorophenylalanine produce disturbed waking, disturbed sleep or activation by ponto-geniculo-occipital waves in cats? Ursin R. **Waking Sleeping** 1980 Jul-Sep;4(3):211-21

CHLORPROMAZINE

Effect of chlorpromazine on conjugal plasmid transfer and sex pili. Mándi Y, et al. **Acta Microbiol Acad Sci Hung** 1981;28(2):205-10

Stability of chlorpromazine liquid in unit dose packaging [letter] Dugas JE. **Am J Hosp Pharm** 1981 Sep;38(9):1276

Membrane-active agents. Effect of various anesthetics and chlorpromazine on arterial lipid metabolism. Bell FP, et al. **Atherosclerosis** 1981 Jul;39(4):517-25

The interaction of chlorpromazine and butyrophenones with glutamate dehydrogenase. Tamir A, et al. **Biochem Pharmacol** 1981 Jun 15; 30(12):1469-73

Studies on the binding of chlorpromazine and chloroquine to melanin in vivo. Tjälve H, et al. **Biochem Pharmacol** 1981 Jul 1; 30(13):1845-7

Daytime variation in serum prolactin level in patients receiving oral and depot antipsychotic medication. Goode DJ, et al. **Biol Psychiatry** 1981 Jul;16(7):653-62

Phenothiazine withdrawal in schizophrenics in a hostel [letter] Mathur S, et al. **Br J Psychiatry** 1981 Mar;138:271-2

Synthesis of phosphatidyl-dCMP in human lymphocytes and its enhancement by chlorpromazine. Medrano E, et al. **Eur J Biochem** 1981 May 15;116(2):249-53

Differential sensitivity to the effects of psychotropic drugs: psychotics vs normals; Asian vs Western populations. Okuma T. **Folia Psychiatr Neurol Jpn** 1981;35(1):79-87

(Ca2+ + Mg2+)-ATPase of chlorpromazine containing rabbit erythrocyte membrane. Au KS. **Gen Pharmacol** 1981;12(4):285-90

Effect of dielectric discharge on drug treated mammalian cells. Mishra KP, et al. **Indian J Exp Biol** 1981 Jun;19(6):520-3

Failure of chlorpromazine to inhibit fluid accumulation caused by Escherichia coli heat-stable enterotoxin in suckling mice. Takeda T, et al. **Infect Immun** 1981 May;32(2):480-3

Protein binding of chlorpromazine in cerebrospinal fluid and serum. Alfredsson G, et al. **Int Pharmacopsychiatry** 1980;15(5):261-9

Selective inhibitory effects of chlorpromazine and imipramine on platelet aggregation. Ishigooka J, et al. **Int Pharmacopsychiatry** 1980; 15(5):270-80

Chronic chlorpromazine administration in rats: effects on ability to work in the heat. Francesconi R, et al. **J Appl Physiol** 1981 Mar; 50(3):509-12

Phototoxicity mechanisms: chlorpromazine photosensitized damage to DNA and cell membranes. Kochevar KE. **J Invest Dermatol** 1981 Jul; 77(1):59-64

Atypical conditions for quantitative recovery of acepromazine and chlorpromazine from plasma. Ballard S, et al. **J Toxicol Environ Health** 1981 May;7(5):745-51

Effects of various membrane phospholipid-interacting drugs on three species of multifunctional protein kinases. Mori T. **Kobe J Med Sci** 1981 Apr;27(2):77-89

Pre- and postsynaptic adrenergic activation by norepinephrine reuptake inhibitors in the field-stimulated rat vas deferens. Lotti VJ, et al. **Life Sci** 1981 Aug 10;29(6):633-9

Effects of short- and long-term neuroleptic treatment on brain serotonin synthesis and turnover: focus on the serotonin hypothesis of schizophrenia. Rastogi RB, et al. **Life Sci** 1981 Aug 17;29(7):735-41

Modulation of platelet shape and membrane receptor binding by Ca2+-calmodulin complex. Kao KJ, et al. **Nature** 1981 Jul 2; 292(5818):82-4

Chlorpromazine: it leaves me cold! Hopkins SJ. **Nurs Mirror** 1981 Aug 12;153(7):34-5

Inactivation of bacteriophage lambda by near-ultraviolet irradiation in the presence of chlorpromazine. Fujita H, et al. **Photochem Photobiol** 1981 Feb;33(2):215-22

Substance P-like immunoreactivity in plasma of psychotic patients and effects of neuroleptics and electroconvulsive therapy. Kaiya H, et al. **Psychiatry Res** 1981 Aug;5(1):11-21

Effect of intramuscular chlorpromazine on serum prolactin levels in schizophrenic patients and normal controls. Meltzer HY, et al. **Psychiatry Res** 1981 Aug;5(1):95-105

[Studies on the situational factors affecting the effect of psychotropic drugs. II. Circadian fluctuation of sedative and anti-apomorphine effects of chlorpromazine (author's transl)] Takagi A. **Seishin Shinkeigaku Zasshi** 1981;83(4):236-50 **(Jpn)**

CHLORPROTHIXENE

The pathophysiology of acute renal failure after chlorprothixene overdosage. Rossen B, et al. **Acta Med Scand** 1981;209(6):525-7

Identification of 2-chlorothioxanthen-9-one in gastric aspirate in a case of chlorprothixene poisoning. Pettersen JE, et al. **J Pharm Sci** 1981 Jul;70(7):812-3

CHOICE BEHAVIOR

Effects of pentobarbital on delayed alternation performance. Terry WS, et al. **Behav Neural Biol** 1981 Jul;32(3):380-5

Temperature preferences and the effect of changes in serotonin in maturing mice. Goodrich C, et al. **Physiol Behav** 1981 Jun; 26(6):1041-7

CLOMIPRAMINE

Treatment of spontaneous panic attacks with chlomipramine. Gloger S, et al. **Am J Psychiatry** 1981 Sep;138(9):1215-7

School phobia: a therapeutic trial with clomipramine and short-term outcome. Berney T, et al. **Br J Psychiatry** 1981 Feb;138:110-8

Suppression of active sleep by chronic treatment with chlorimipramine during early postnatal development: effects upon adult sleep and behavior in the rat. Mirmiran M, et al. **Brain Res** 1981 Jan 5; 204(1):129-46

A double-blind multicentre trial comparing the efficacy and side-effects of mianserin and chlorimipramine in depressed in- and outpatients. Pinder RM, et al. **Int Pharmacopsychiatry** 1980;15(4):218-27

Effects of antidepressant treatment with clomipramine on hormonal responses to thyrotropin-releasing hormone and insulin-induced hypoglycemia: implications for the 'monoamine-hypothesis'. Langer G, et al. **Pharmacopsychiatria** 1981 May;14(3):100-6

Double-blind comparative study of clomipramine and amitriptyline in obsessive neurosis. Ananth J, et al. **Prog Neuropsychopharmacol** 1981; 5(3):257-62

A multicenter controlled trial in phobic-obsessive psychoneurosis. The effect of chlorimipramine and of its combinations with haloperidol and diazepam. Cassano GB, et al. **Prog Neuropsychopharmacol** 1981; 5(2):129-38

[Clinical investigation comparing trazodone and clomipramine] Lange E, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1980 Dec;32(12):748-50 **(Ger)**

COCAINE

Pulmonary dysfunction in cocaine smokers. Weiss RD, et al.

Am J Psychiatry 1981 Aug;138(8):1110-2

Inverse relation of substance P-like immunoreactivity in dorsal raphe nucleus to serotonin levels in pons-medulla following administration of cocaine and 5-hydroxytryptophan. Pradhan S, et al. **Biochem Pharmacol** 1981 May 15;30(10):1071-6

The acquisition of responding with conditioned reinforcement: effects of cocaine, (+)-amphetamine and pipradrol. Beninger RJ, et al. **Br J Pharmacol** 1981 Sep;74(1):149-54

Cocaine cue in pigeons: time course studies and generalization to structurally related compounds (norcocaine, WIN 35,428 and 35,065-2) and (+)-amphetamine. Järbe TU. **Br J Pharmacol** 1981 Aug; 73(4):843-52

Cocaine facilitates the effects of alpha-agonists and antagonists on adrenergic neurotransmission. Nigro D, et al. **Gen Pharmacol** 1981; 12(4):255-9

Mass spectral quantitation of cocaine HCl in powders. Clark CC. **J Assoc Off Anal Chem** 1981 Jul;64(4):884-8

The 'body packer syndrome'-toxicity following ingestion of illicit drugs packaged for transportation. Wetli CV, et al. **J Forensic Sci** 1981 Jul; 26(3):492-500

Effect of cocaine on noradrenaline contractions of mesenteric vein: pre or postjunctional mechanism? O'Connor PC, et al. **J Pharm Pharmacol** 1981 Jan;33(1):58-60

Effect of cocaine on contractile responses to noradrenaline of canine isolated mesenteric vein. O'Connor PC, et al. **J Pharm Pharmacol** 1981 Jan;33(1):55-8

Effects of denervation, decentralization and cocaine on the responses of the guinea-pig vas deferens to phenylephrine in vivo and in vitro. Sannomiya P, et al. **J Pharm Pharmacol** 1981 Jun;33(6):388-9

Effects of cocaine on Ca-mobility in microsomal fraction from rat vas deferens. Hisayama T, et al. **Jpn J Pharmacol** 1981 Feb;31(1):1-6

Pre- and postsynaptic adrenergic activation by norepinephrine reuptake inhibitors in the field-stimulated rat vas deferens. Lotti VJ, et al. **Life Sci** 1981 Aug 10;29(6):633-9

Self-stimulation and amphetamine: tolerance to d and l isomers and cross tolerance to cocaine and methylphenidate. Leith NJ, et al. **Psychopharmacology (Berlin)** 1981;74(1):23-8

COGNITION

Brief fasting, stress, and cognition in children. Pollitt E, et al. **Am J Clin Nutr** 1981 Aug;34(8):1526-33

Cognition-activating properties of 3-(Aryloxy)pyridines. Butler DE, et al. **J Med Chem** 1981 Mar;24(3):346-50

Evaluation of information sequential aspects of schizophrenic performance. II. Research strategies and methodological issues. Neufeld RW, et al. **J Nerv Ment Dis** 1981 Sep;169(9):569-79 (77 ref.)

[Effect of phenobarbital on self-ratings of healthy subjects in comparison to the objective impairment of their performance] Walther H, et al. **Acta Biol Med Ger** 1980;39(8-9):949-60 (Eng. Abstr.) (Ger)

[Influence of thioridazine on cognitive, psychomotor, and reaction performance in patients with dysthymic-depressive syndrome (author's transl)] Meyer FP, et al. **Pharmacopsychiatria** 1981 May;14(3):94-9 (Ger)

COGNITION DISORDERS

Span of apprehension deficits during the postpsychotic stages of schizophrenia. A replication and extension. Asarnow RF, et al. **Arch Gen Psychiatry** 1981 Sep;38(9):1006-11

Cognitive dysfunction and imipramine in outpatient depressive. Glass RM, et al. **Arch Gen Psychiatry** 1981 Sep;38(9):1048-51

CONDITIONING (PSYCHOLOGY)

The acute effect of p-chloroamphetamine on the retention of fear conditioning in the rat: evidence for a role of serotonin in memory consolidation. Archer T, et al. **Neurosci Lett** 1981 Aug 7; 25(1):75-81

6-Hydroxydopamine and radiofrequency lesions of the lateral entorhinal cortex facilitate an operant appetitive conditioning task in mice. Gauthier M, et al. **Neurosci Lett** 1981 Jul 2;24(2):193-7

CONDITIONING, CLASSICAL

Extinction of a conditioned taste aversion in young, mid-aged, and aged C57/BL6 mice. Springer AD, et al. **Behav Neural Biol** 1981 Jul; 32(3):282-94

Forebrain norepinephrine and serotonin concentrations and cardiac conditioning in normal rabbits and rabbits with septal lesions. Hernández LL, et al. **Brain Res Bull** 1981 Jun;6(6):479-86

Effects of haloperidol and pimozide on classical conditioning of the rabbit nictitating membrane response. Harvey JA, et al. **J Pharmacol Exp Ther** 1981 Sep;218(3):712-9

Sexually dimorphic acquisition of a conditioned taste aversion in rats: effects of gonadectomy, testosterone replacement and water deprivation. Chambers KC, et al. **Physiol Behav** 1981 Jul;27(1):83-8

[Dopamine concentration in the nigro-striatal system during elaboration and performance of conditioned avoidance reactions of various complexity in rats] Saul'skaia NB. **Fiziol Zh SSSR** 1981 Jun; 67(6):797-803 (Eng. Abstr.) (Rus)

[Age and sex differences in the elaboration and maintenance of conditioned taste aversion in rats] Kassil' VG, et al. **Zh Vyssh Nerv Deiat** 1981 May-Jun;31(3):630-2 (Rus)

[Effect of scopolamine on temporary connection formation and fixation in rats with altered brain noradrenaline content] Orlova NV. **Zh Vyssh Nerv Deiat** 1981 May-Jun;31(3):571-6 (Eng. Abstr.) (Rus)

CONDITIONING, OPERANT

The acquisition of responding with conditioned reinforcement: effects of cocaine, (+)-amphetamine and pipradrol. Beninger RJ, et al. **Br J Pharmacol** 1981 Sep;74(1):149-54

Drug effects on multiple and alternating mixed-schedule performance. Leander JD. **J Pharmacol Exp Ther** 1981 Sep;218(3):728-33

The behavioral effects of hallucinogens in rats following 5,7-dihydroxytryptamine administration into the medial forebrain bundle. Commissaris RL, et al. **Pharmacol Biochem Behav** 1981 Jun; 14(6):915-8

Effects of diazepam on operant behavior in man. Carlton PL, et al. **Psychopharmacology (Berlin)** 1981;73(4):314-7

A multivariate analysis of some operant variables used in behavioral pharmacology. Walker CH, et al. **Psychopharmacology (Berlin)** 1981; 74(2):182-6

CONFLICT (PSYCHOLOGY)

Effect of gamma-vinyl GABA alone or associated with diazepam on a conflict test in the rat. Huot S, et al. **Adv Biochem Psychopharmacol** 1981;29:45-52

Constructs and 'conflict' in depression. Sheehan MJ. **Br J Psychol** 1981 May;72(Pt 2):197-209

Hostility conflict and the effect of chlordiazepoxide on change in hostility level. Downing RW, et al. **Compr Psychiatry** 1981 Jul-Aug; 22(4):362-7

Effects of buspirone on conflict behavior of laboratory rats and monkeys. Hartmann RJ, et al. **Proc West Pharmacol Soc** 1981;24:179-81

Comparison of anti-conflict drug effects in three experimental animal models of anxiety. Kilts CD, et al. **Psychopharmacology (Berlin)** 1981; 74(3):290-6

CONSUMMATORY BEHAVIOR

Relation of consummatory responses and preabsorptive insulin release to palatability and learned taste aversions. Berridge K, et al. **J Comp Physiol Psychol** 1981 Jun;95(3):363-82

CORTICOSTERONE

Effect of ovariectomy, thyroidectomy and of thyroxine treatment on the plasma level of corticosterone of the female Japanese quail. Péczely P, et al. **Acta Biol Acad Sci Hung** 1981;32(1):1-6

Effect of electroconvulsive treatment on brain monoamine content, pituitary-adrenal function and plasma prolactin. Arató M, et al. **Acta Physiol Acad Sci Hung** 1980;56(2):163-71

Plasma corticosterone, thyroxine and triiodothyronine level in the collared dove (Streptopelia decaocto) during the reproductive cycle. Péczely P, et al. **Acta Physiol Acad Sci Hung** 1980;56(4):421-30

Corticosterone levels in mice exposed to high-intensity electric fields. Hackman RM, et al. **Behav Neural Biol** 1981 Jun;32(2):201-13

In vitro effect of prostaglandins on corticosterone and aldosterone production by frog interrenal gland. Delarue C, et al. **Biochem Biophys Res Commun** 1981 May 29;100(2):769-77

Effect of escin on adrenocorticotropin and corticosterone levels in rat plasma. Hiai S, et al. **Chem Pharm Bull (Tokyo)** 1981 Feb; 29(2):490-4

Chemical structures and corticosterone secretion-inducing activities of saikosaponins. Yokoyama H, et al. **Chem Pharm Bull (Tokyo)** 1981 Feb; 29(2):500-4

Evaluation of the mineralocorticoid activity of 18-hydroxycorticosterone. Huston G, et al. **Clin Sci** 1981 Aug;61(2):201-6

Serotonin regulation of corticoid secretion in infant rats. Grota LJ. **Dev Psychobiol** 1981 May;14(3):221-8

Modulation of the direct effect of corticosterone upon glucose-induced insulin secretion of rat isolated islets of Langerhans. Billaudel B, et al. **Diabete Metab** 1981 Jun;7(2):91-6

Effect of thyroxine, testosterone, and corticosterone on nerve growth factor (NGF) and epidermal growth factor (EGF) concentrations in adult female mouse submaxillary gland: dissociation of NGF and EGF responses. Walker P, et al. **Endocrinology** 1981 Aug;109(2):582-7

Tissue distribution of 3H-corticosterone in response to stress. Kolta MG, et al. **Endokrinologie** 1981 Apr;77(2):179-84

Effect or partial hepatectomy on secretion and metabolism of corticosterone in the rat. Malendowicz LK, et al. **Endokrinologie** 1981

Mar;77(3):291-6

Response of medial septal neurons to the iontophoretic application of glucocorticoids. Papir-Kricheli D, et al. **Exp Neurol** 1981 Sep; 73(3):801-11

Parenteral feeding abolishes the circadian adrenocortical rhythm in rats. Saito M, et al. **Experientia** 1981 Jul 15;37(7):754-5
